New Quartz District.—A new mining district called the Golconda, has been formed in the vicinity of Perkins' Ranch, ahout 25 miles west of this city. Some 25 locations have already heen recorded and there are quite a uumber of men prospecting for other ledges. From specimens of the ore that has heen suhmitted to our inspection, we judge that the discovery is the most valuable one that has yet been made in this county, as the ore is of good quality, assaying all the way from $175 to $3,500 per ton and is what is generally known as free milling ore. The ledges are of fair size—from four to eight feet in width—and can be easily worked. The district is well wooded and watered—and there are also several fine coal heds in the immediate vicinity. The discoverers, Messrs. Alex. Delong and Hugh T. Patton, have let a contract to sink a shaft on the Golconda ledge, tbe largest and best in the district, to a depth of 100 feet for the sum of $1,200. As the principal ledgee are owned hy men of some means, there is reason to believe that the district will he rapidly developed. Should future delopments confirm the favorable opinion now entertained of the Golconda District, it will not he long before a thriving town will spring up tbere. The prospects are very flattering indeed that Deer Lodge county will always be the hanner couuty of Montana, in the production of the precious metals.—*Deer Lodge Independent.*

Coal and Iron.—The coals of this coast, including the Rocky Mouutains, Mount Diabalo and Oregon, at present worked, belong to a much later age thau the coals of Pennsylvania and Virginia, and those we import from England. Our coals are not suitcd to iron making in the furnace and the rolling mill. Iron ore of excellent quality abounds in California; hut for want of suitable coals. and by reason of distance inland, it is unavailahle. Trne coal of the ancient carhoniferous formation, ie reported in the Trinity River country. It is a true haking, hituminous coal. Recent exploration describes tbis coal-basin as thirty miles long, and it seems of good size. It is nnderlaid with rich ironstone. Here, probahly, will be the great iron factories of the State.

Wells for Irrigating.—The farmers of Contra Costa have gone iuto the business of digging wells aud erecting wind-mille for local irrigating purposes. The eoils of that county are highly productive, but many of the hest tracts of land are liahle to drouth, excepting in seasons of ahuudant rain. The grand irrigating ditch for which they have heen waiting will prohahly not reach down to Antioch for several years to come. In the meantime, a great deal of irrigating can he done in the manner above noted. The editor of the Antioch *Ledger* the other day counted twenty-five wind-mills hetween that town aud Point Timher. Water in the wells is plentiful, and reached without going to any very great depth.

A Pioche dispatch says: The bullion shipments from this city per Wells, Fargo & Co. for the past seven days, amounted to $117,-318.24, showing a small increase over thoso of the previous weeks. Work is generally ae hrisk as ever in the mines throughout the district, and preparations for hoisting are now more active and important. The new Condor mill will he in complete running order in a few daye.

The Norfolk, Va., Manufacturing Company have huilt two canal hoats to compete for the New York State prize. Both hoate are constructed to hinge together, how and stern, hy a patent process, the latter portion of which will carry the motive power, which consists of a screw propeller and engine of forty-horse power.

A new eteam drill, capahle of boring a hole eight inchee in diameter, hae just heen introduced in the anthracite regions hy the Pennsylvania Coal Company. It will hore further in one day than a dozen men with the old drille could drill in a month.

Belt's Patent Sheet Iron Roofing.

PATENTED AUGUST 8, 1871.

THE CHEAPEST AND BEST IRON ROOFING MADE.

This Roofing having received, by practical test, the unqualified indorsement and approbation of all who have used it, for its ease and simplicity of application by any ordinary mechanic or laboring man, embracing an extent of territory, in its adoption, almost unparalleled in the history of any Metal Roof ever placed before the public. Combining in its superiority of merit and worth, CHEAPNESS AND DURABILITY, with all the desired qualities of a

Fire, Water and Wind-Proof Roofing,

Resisting and withstanding perfectly harmless its test in the frigid regions of Minnesota and Northern Michigan, the windy passes of the Rocky Mountains (U. S Government Quarters at Fort " D. A. Russell," W. T., covered with this Roofing), the torrid zone of Southern Texas, and many seabord States east and south, and in every Western State between Lake Huron and the Gulf of Mexico, making an array of practical and testimonial merit that must carry confidence and conviction to the minds of all, as to its superiority and worth.

Highly Commending Itself to the Attention and Examination of all

Interested, and desiring a superior Roofing.

The sheets are 8 feet long and 2 feet wide from centers of exposed surface.

Each sheet is heavily coated on both sides with the best Metallic Paint, mixed with pure boiled Linseed Oil.

The Roofing is packed in iron-bound boxes for shipment to any section of the country, accompanied with full instructions as to its simple mode of application.

DREYFUS' PATENT SELF-OILERS,
For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cane are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes. Send for Price List and Circular.
Address TREADWELL & CO.,
26v24 San Francisco.

REMINGTON'S
BREECH-LOADING
Sporting, Hunting, and Target Rifles.
Same system as the "Remington" Celebrated Military Rifle, of which over half a million have been sold. Its simplicity unsurpassed. For strength and durability unequalled. In accuracy unrivalled. In range, penetration, and ease of manipulation, without comparison.
The "Sportsman's" Delight, the "Hunter's" Favorite, the "Target-Shooter's" Pride. Also
REVOLVERS FOR HOUSE USE.
In these days of thieves and Burglaries, every householder should have a revolver for home protection.
REMINGTON'S RIFLE CANE.
Every gentleman should have one for protection against dogs and rowdies, and for field use.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

SAN FRANCISCO AND COLORADO RIVER RAILWAY.
Office of the San Francisco and Colorado River Railway Company,
NO. 305 SANSOME STREET,
SAN FRANCISCO.....SEPT. 24, 1872.
TO THE PUBLIC.
THE BOARD OF SUPERVISORS OF THE CITY and County of San Francisco, having passed an Ordinance submitting to the Electors the question of granting a subsidy to our Company, for the Construction of a Railroad to the Colorado River, to connect with the railroads being built from the East, we are now in a better position to ask the citizens of San Francisco to join us and urge the importance of the undertaking; and beg to say:
First—We propose in good faith to build a first-class railroad, with all the dispatch possible, and certainly within the time provided in the ordinance.
Second—We pledge ourselves as men to the fact that we are entirely disconnected and free from all association with the Central or Southern Pacific Railroad Companies or their Managers or Directors, and are in genuine competition with them, and we have no association or connection with any other Railroad Company or combination in existence, and expect to have none, except business or running arrangements with lines from the East and South, which hereafter may desire to exchange business with us.
Third—We invite every citizen of the City and County of San Francisco to subscribe to our stock. Our Books are open to all. Our Company is not a close corporation, and in no sense a monopoly. We particularly invite every Taxpayer to subscribe, at least as much as he will be called upon to contribute to the subsidy, and thus, in a manner, free of legal difficulties, participate in the advantages growing out of the enterprise.
Fourth—A Committee of the Board will be in attendance at the office of the Company, No 305 Sansome street, to receive subscriptions, and duly authorized parties will wait upon the citizens generally, giving them an opportunity to subscribe.
Fifth—This being an independent and competing road, there can be no reason for those who desire the success of such an enterprise to decline their co-operation, which we cordially invite.

The California State Fair.

Held at Sacramento, Sept. 19 to 28, 1872.

Exhibition of Manufactures, Inventions, Etc.

A Bag Filler.—Mr. Wasson, exhibited for Wasson & Durgan, of Carson City, Nevada, a eimply constructed bag or eack holder that seemed to us a meritorious article. It is readily adjustable for any sized sack. It ie raised by levers when ready for tieing and deteching, and can at any instant he ehaken to solidify ite contente. They can he eold for $10 apiece, or less, are easily transportahle and decidedly dnrahle. Mr. W. offers rights for sele, but will in the meantime proceed to manufacture at once on this Coast. He has several other important and ingenious inventions which we may notice hereafter.

Subsoil Gang-Plow.—Myers & Gummow, of Marysville, exhihited their excellent subsoil gaug-plow; a peculiar feature of which is, that it cau he used either as a single plow and a suhsoiler, or as a two-gang plow. It does splendid work, and is highly spoken of hy every one who has put them to a trial.

Side-hill Plow.—This very meritorious invention, Scoville's Climax Side-hill Plow, exhibited by Treadwell & Co., San Francisco—who are the agents for the Pacific Coast—eeeme of those really valuable inventions that eometimes from their very appeerance attract the attention of amateurs. Plowe don't speek, but if they did, thie one would speak for itself, for the superior workmanship of the implement, and spiendid plowing it is capehle of doing. This compeuy also exhibit Huie's patent gang-plow, said to he a very efficient and desirahle comhination, forming a sulkey-seat gang, extensively used here and at the East, and with "Jones' plow-hottoms," the improvement of 1872, is probahly one of the hest plows in nse.

Grain Separator.—Nash, Miller & Co.,—ae was expected,—were on hand with their improved Nash & Cutts' Grain Separator, manufactured at Sacramento, and which they were ready to set out against any other grain separator in this or any other country. In fact, they are simply ready to compete with anything in their line of manufactures. They are extenеively used.

Premium Grain Separator.—This California invention, hy W. D. Freemau, patentee, of Tomales, Marin Co., is peculiar in its screen arrangement, which gives it power over other eeparators, in freeing oate from all manner of pode and other foul seeds, and eeparating different sized grains, rendering it one of the moet satisfactory machines ever introduced for its specialtiee.

Hydraulic Mill and Mining Lamps.—This most valuable invention for lighting mille, miues and other special pnrposes, was on exhihition and received considerahle attention. It is certainly a new and important manufacture for thie coast. A epecialty connected with this lamp is the use of gasoline with perfect eafety, the lamp heing essentially non-explosive. C. B. Brown, Placerville, Cal., is the patentee.

Hydraulic Joints.—Conspicuous among the few mining inventions on exhihition was the "Dictator and Little Giant Hydraulic Jointe." They are claimed to be euperior to anything that has ever heen in use hefore, and their very appearance would indicate their ueefulness and adaptability. R. Hoskin, of Dutch Flat, Cal., is the sole manufacturer.

Imperial Washer.—Reynolds & Fuller, Sacramento, exhihited their Imperial wash boiler and waehing machine combined. Evidently made compact for convenience and economy of apace and fuel.

Manker's Sash Balance.—This invention is intended to do away with the ever-hreaking cords of sash weights and the attendant trouble of repeated renewal. It consista of a coiled epriug so arranged and attached to the side of the aash and window frame that when the sash or window is lowered, the spring is, in effect, wound up, and consequently takes to itself the weight of the window, and holding itself ready to raise the same hy the aid of an extremely small amount of additional power, snch as any child can apply. Addrese E. B. Tenney, Sacramento.

Grape Crusher and Stemmer.—Schoenetein & Klein's patent grape crusher waa on exhihition and attracted the attention of those who are makers of wine on a large scale. Patent rights for thie machine are for sale by F. B. Shoenstein, S. F.

Johnston's Grape Crusher.—Thie ia another of those machines now considered indispensahle to the wine maker. It thoroughly crushes the grapes without hreaking the aeeds, and effectually aeparates the stems from the pulp in the most rapid and complete manner. It is patented by Geo. and W. F. Johnston. It is now in use by the Johnston Co., Sacramento.

The Napa Churn.—This celehrated churn invented and patented hy E. Groat, Napa City, wae one of those articles that would commaud attention anywhere. It ia on entirely a new plan and seeme to combine eimplicity of construction, cheapuese, durability, power aud effectiveness in an eminent degree. It is patented also in foreign countriee, and the patentee haa heen east to perfect the mannfacture of them. We expect to give an illustration of it at some future day.

Tonn's Roller Skates.—This, the simplest of all parlor skates and yet ona of the most elastic and durable, is the invention of Mr. Todd, the well-known photographer of Sacramento.

Building Paper.—Peck & Brown, Sacramento, exhibited specimens of hnilding paper, plastering hoard, roofiug felt, tarred sheathing and moth-proof carpet felt, new articles just introduced to this market, that give promise of extensive application to the nses for which they are deeigned.

James' Spring Bed.—S. Look, San Francisco, agent for the Pacific Coast, exhibited this celehrated spring bed.

Combined Portable Desk and Settee.—Nothing set us up hetter then the exhibition of Peard's Patent School Desk and Settee combined, manufactured hy the School Furniture Company of Chicago, Illinois. They not only offer superior comfort and accommodation to the pupil, but they can he folded so as to occupy a space of only ten inchee. The advanteges derivable from this arrangement are sufficiently ohvioue. They are made of cherry, or of cherry and walnut comhined. Messrs Roman & Co., of this city, are the agents for the Pacific coast.

Post and Well Borer.—A California invention, the Orchard Post and Well Auger, is of the highest importance to our farmere, and will help to render cultivahle, many tracts that are now considered hopelessly arid. It's cutters are made of eteel, and it completee its work without the aid of a mud pnmp. It hae bored through fifty feet of hard-pan, cement, clay and gravel in nearly half a day. It is undoubtedly one of the most valuable of recent California inventions.

Remarkable Fleece. — C. C. Baker, near Modesto, exhihits the fleece of a four-year old huck, the weight of the fleece heing 38 lhs., as sworn to hy one editor, one post-master, and two farmers; certainly enough to leave no douht of its truthfulnese. It was eheared on the 17th of Sept., 1872, having been previously eheared on the 18th of Sept., 1871.

American Bottle Filler.—This is an improved Filler, hy Messrs J. Armstrong & Marke, 240, 6th street, S. F., an invention by which one hundred dozen piuts cau be filled in an hour.

Gang Plow.—Manuel and Sawyer, Napa, exhibit a new gang-plow, with a rear-wheel attachment following the plow in the furrow, by which the friction on the bottom of the plow is greatly lessened. They have just commenced mannfacturing; the castings are light and the plow simple throughout.

Carbolic Acid Disinfectant.—The Pacific Wood Preserving Company exhihits this ingredient, which is manufactured very economically from the residuum of the materials used in their wood-preserving process. They also exhihited specimens showing the destructive effects of the Toredo, on unpreserved wood, and the perfect protection afforded hy the preserving proceee. Office of the Compauy, 338 Montgomery street, S. F.

The Johnston Still.—Geo. Johnstou exhibited a model of his improved still, showing the principle of its operation; which producee brandy from a first distillaiion, free from fuseloil. Also a keg sample of the brandy of the vintage of 1871, which experienced tastere eay possessee rare and decidedly fine qualitiee. Mr. Johnston has patented his still in Europe and is already in receipt of a reguler income from its use in England.

Beehives and Bees.—J. S. Harhison exhihits his patent hivee. Also glass and metallic casee containing hees, and showing the pure honey. Mr. H. has some 2,000 hivee of hees, large numhere of which he removes to different parte of the country to secure the best pasturage. Sometimee near the summit of the Sierrae, at others in the low conntry of Santa Cruz connty. It has heen discovered that the hlossom of the Buckeye killa hees—onr bee keeper readers will make a note of this.

Tule Plow.—McCall, of Santa Clara, exhihited his tule plow, of which mention haa heen made heretofore. It was tried in Yolo county during the Fair, and reported on favorahly. The peculiar featnre in its operation ia the cntting the soil into rihhona and completely inverting it. The inventor is meeting with encouragement, having several orders for its manufactnre.

Glass Works. — The San Francisco glass works exhihit specimens of white and colored glass, etc., making a fine display of home manufactured articlee. Their hanging plant baekets, entirely of glasa, were particularly attractive.

Mineral Glazing Tool. — A rotary glasscntting instrument, of carbonized steel, equal to, and in many respects hetter than, a diamond, are meeting with an extensive sale. The City Novelty Company, San Francisco, has the sole agency for the Pacific Coast.

In connection with its exhibition at the Paviliou was the circumstance of its developing a remarkahle talent in young Charlie Weinreich of Sacramento, who after a few hours application to the use of the instrument, hecame singularly expert in its management, attracting general admiration.

Infallible Yeast Powders.—There was a conspicuous display of thie compound by Bowen Brothere, S. F. It is a class of articles used more in Califoruia prohably, than in auy other section of our country.

Cost of Great Tunnels.—The Mount Cenis Tnnnel cost $975 per linear yard, the cost of the Hoosac tunnel is ahout $900, and that of the most expensive in England, the Saltwood, is only $590.

Our Agents.

Our Friends can do much in aid of our paper and the canse of prsctical knowledge and science, by assisting Agents in their labors of canvassing, by lending their infinence and encouraging favors. We intend to send none bnt worthy men.

For instance, 21sp70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy72, that he has paid to the 4th of January, 1872; 4j173, to the 4th of July, 1873. The inverted letters (†‡§¶, etc.,) occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

☞ *Postmasters, please send corrections also.*

Roasting of Gold and Silver Ores, and the

Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is libewally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of fnrnacee, implements and working apparatus.

It is a work of great merit, by an author whose reputation is nnsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postsge free.

The above work, by Guido Kustel, is sold by Dewey & Co., Publishers, Patent Agents and Engravers, at No. 338 Montgomery street, San Francisco.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press. 1amb p

U. S. Mining Laws and Regulations.—Dewey & Co., proprietors of the Mining and Scientific Press—the American and Foreign Patent Agents of this city—have published in convenient pamphlet form the United States Mining Laws, and the regulations thereof; showing how mining lands may be purchased, manner of obtaining title to mining claims, and giving all necessary instructions to miners how to avoid difficulties with adverse claimants. It is a valuable document—one that every person who is interested in mines should have a copy of. It can be had for 26 cents per copy at their office, No. 338 Montgomery street, San Francisco.

Continental Life Insurance Co., No. 302 Montgomery street, corner of Pine.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company—Location

of works, Grass Valley, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of October, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, at No. 28 Merchants' Exchange, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 2d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 25th day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office—28 Merchants' Exchange, San Francisco, Cal. oct5-5i

Auburn Gold Mining Company.—Location

of Works, Auburn, Placer County, California.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 13th day of September, 1872, an assessment of twenty-five cents per share was levied on the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, No. 7 Stevenson Building, in San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, October 14th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, November 6th, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. W. DIXON, Secretary.

No. 7 Stevenson Building, corner of Montgomery and California streets, San Francisco, California. se21-4w

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of tha Company, No. 409 California street, San Francisco, California, on the 20th day of August, 1872, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. T. F. CRONISE, Secretary.

Office, 409 California Street, San Francisco, California.

At a meeting of the Board of Trustees held this day, the above sale was postponed to Monday, the 16th day of September, 1872, at the same place and hour.

T. F. CRONISE, Secretary.

San Francisco, Cal., August 19, 1872.

POSTPONEMENT.—At a meeting of the Trustees, held this day, the above sale was postponed to Wednesday, the 15th day of October, 1872, at the same hour and place. T. F. CRONISE, Secretary.

San Francisco, Cal., Sept. 16, 1872.

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

Should see that their advertisements are advertised legally in the MINING AND SCIENTIFIC PRESS, at less than one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of dates for weekly advertising, free blanks, and a copy of the Corporation Assessment Law.

ONE DOLLAR A YEAR

—FOR THE—

PACIFIC COAST

Mercantile Director.

This is a new 16-page monthly newspaper, of special information for wholesale and retail trademen. It will also contain reading of interest and importance to all business and professional men on the coast.

OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Produce Markets; Rates of Freight and Passenger Fares—corrected monthly; Illustrations and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provision;" "Dry Goods;" "Trades and Manufactures," etc., etc.

Our first issue for May consists of 24 pages, embracing FORTY-FIVE COLUMNS of important reading matter—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

Published by MURRAY, DEWEY & CO., At the Publishing Office of the Mining and Scientific Press and Pacific Rural Press, San Francisco.

The C-Spring Roller Skate.

PATENTED 1871.

Rights and Skates for Sale.

This superior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

THIS SKATE IS POSITIVELY NO INFRINGEMENT

Of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

START A RINK,

Should examine and test this Skate. Sample pairs sent C. O. D. on application.

In ordering samples, state the number of boot or shoe worn, and whether for lady or gentleman.

For City, County or Rink Rights, call on or address

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

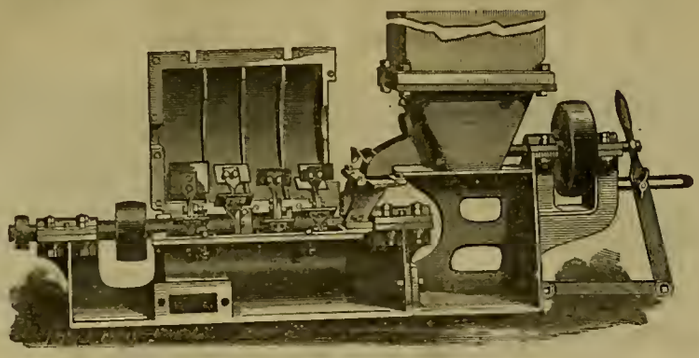
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operations. Respectfully, J. W. JONES, Superintendent, etc.

May be seen in practical operation on Main street, between Howard and Folsom, San Francisco.

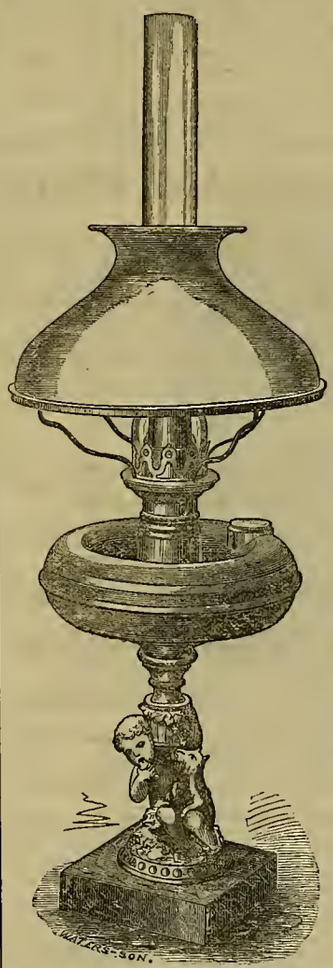
This Machinery has been adopted by nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

9v25-3m GEO. D. WYMAN, Agent Pacific Coast.

BRIGHT UNION SAFETY LAMP.

A CALIFORNIA INVENTION.

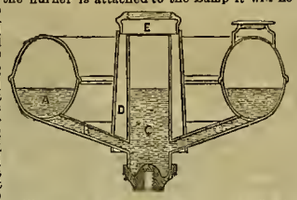


Patented May 30, 1871. Is the Best and Safest Lamp ever put in the market, for the following reasons:

1st.—The Lamp is constructed with two tubes, as will be seen in cut, the outside one (D) intended only for the attachment of the burner, and the inside one (O) to contain oil and receive the wick. As there is no connection between these tubes, it will be evident that there is no possibility of communicating any heat to the oil; and as long as the oil in a Lamp can be kept perfectly cool, there is, of course, no chance for an explosion.

This Lamp is the only one ever invented in which this result has been secured.

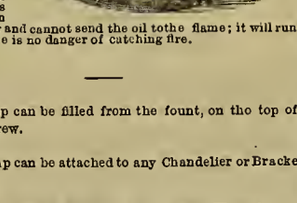
2d.—When the burner is attached to the Lamp it will be seen that there is no opportunity for the oil to escape should the Lamp be overturned, and in case any accident should occur the worst consequences that could ensue would be the breaking of a chimney or shade. From these facts it will be evident that those who adopt this Lamp will secure themselves against the possibility of fire or explosion arising from the use of kerosene oil.



3d.—The Lamp is strongly and well made, attractive in appearance, and something entirely new and novel. It will burn kerosene adapted to any burner. With all of these advantages it combines cheapness, and from present indications it is destined to become very popular.

4th.—The tube to which the burner is attached (D) is free from the tube of the oil (O), and a space for air, passing from the lower end, between the tube of the burner and the tube of the oil, keeps it always cool.

5th.—The burner is the cause of generating the gas in a Lamp. It cannot do it in this Lamp, as the burner is set on a tube which contains no oil, consequently it cannot make any gas.



6th.—In case of accident, the Lamp falling or thrown over, by which many explosions occur, is the cause of the oil rushing to the flame. In this Lamp it is not so; it can be thrown over and cannot send the oil to the flame; it will run from it, so there is no danger of catching fire.

This Lamp can be filled from the fount, on the top of which is a screw.

This Lamp can be attached to any Chandelier or Bracket made.

"Indefatigable Energy and Industry."

We made mention yesterday of the arrival of L. P. McCarty, the well known and reliable correspondent of the San Francisco MINING AND SCIENTIFIC PRESS. Mr. McCarty was here some weeks ago, and made a thorough examination of our district. From Eureka he wrote a five column letter to his paper, giving a more complete resume of mining and business matters in this section than we thought possible to crowd into a letter of that length. All the principal mines, including a description of the various works, and the names of the managers, are alluded to with the utmost accuracy. In fact, we have gathered several points from Mr. McCarty's letter relative to our district, that we did not know before. For instance, he informs us that there are about twelve hundred claims located in the district, exclusive of sixty tunnel sites located under the new law of Congress. Taken throughout, the correspondence bears the impress of truth and indefatigable energy and industry. Such letters, from an acknowledged and reliable source, brought direct to the attention of the mining world, must necessarily be productive of great good to our growing camp. Mr. McCarty has taken notes in all of the prominent districts of Eastern Nevada, and for the next three or four months his paper will contain truthful accounts of the immense wealth of this section of the State. He leaves to-morrow for Austin and Belmont.—*Eureka Sentinel, Aug. 16th.*

The United States Mining Laws.

The MINING AND SCIENTIFIC PRESS publishes in neat, convenient form, and on good paper, the "United States Mining Laws and Regulations Thereunder," from official copy. Of course, to all in any way interested in mining, it is a great convenience to be able to refer to these laws whenever the necessity presents itself. Sold at the office of the MINING AND SCIENTIFIC PRESS for twenty-five cents. —*S. F. Daily Chronicle.*

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated: It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

THE LITTLE GIANT HYDRAULIC NOZZLE

IS FAR SUPERIOR TO ALL OTHERS.

Many persons have been deterred from purchasing by the representations of Mr. F. H. FISHER, that the LITTLE GIANT is an infringement on his patent. The statement is utterly false. Said Fisher was tried and convicted and fined for infringing on one of the patents embodied in the LITTLE GIANT. He has again transgressed, and will soon have to appear for sentence, and the parties who purchased of him will be attended to in due time.

The Little Giant was Awarded a Special Premium of a Silver Medal
AT THE STATE FAIR OF CALIFORNIA IN 1872.

I manufacture Machines of all sizes, and am sole licensee and manufacturer under Craig's, Masey's, Rice's, Allenwood's and Hoskin's Patents. I will fully protect my patrons against any or all others. Send for Circular, containing testimonials, etc., to

R. HOSKIN, Dutch Flat, Cal.

SAN FRANCISCO, SATURDAY, OCTOBER 19, 1872.

VOLUME XXV. Number 16.

A Jury of Experts.

Two remarkable series of trials, one on the Atlantic and tbo other on tbe Pacifio Coast, bave lately attracted a large amonnt of attention and bave prominently indicated the ntter nnfitness of our jurors, as now selected, to decide qnestions which involve scientifie data. Believe as we will of the justice of the final decisions, our reflections must be full of misgivings concerning our jury system.

The details of the trial of Dr. Scboeppe have been widely pnblished, but a brief outline of the facts may be given here. The doctor was tried some time ago on a charge of poisoning; a certain Prof. Aiken testified to the presence of poison in the stomach of the person snpposed to bave been murdered, and mainly on the strength of this evidence the doctor was fonnd gnilty and condemned to death. By most persistent exertions on the part of bis friends, aided by a number of chemists who decided Prof. Aiken's analysis entirely incorrect, with great difficulty a second trial was secured for the doctor. He was then acqnitted, the msin point of the prosecution, the testimony of Prof. Aiken as to the presence of tbe poison in the stomach of the dead person, being overthrown. So great was the excitement that the jndge publicly "thanked God tbat *Providence had interposed* to prevent a great wrong!"

Of the two trials of Mrs. Fair we need give no details. They have been the prevailing topics of conversation for a long time. Mrs. Fair has been decided to have been insane by twelve men who are ignorant of all the phases of insanity. We do not mean here to sey that their verdict was wrong; but we desire to point out tbat their decision has failed to have the slightest influence on the opinions of any person.

Tbese are two of tbe most prominent of the oases which are daily occurring, in which questions of life or death, questions involving the highest and most delicete skill of the physician and of the chemist, are decided by persons unacquainted with even the terms of science. Had the wit of man been employed to devise tribunals more nnfitted for such purposes, it might easily have exhansted itself in the vain attempt. The thing would appear most snpremely ridicnlous, were it not for the fact that the life of our fellow beings were endangered. That this condition of affairs should be allowed, verges upon the criminel.

The present method of selecting jnries, which substantially excludes all men of average intelligence in any prominent trial, is bad enough in any case. In trials where the life of the accused is at stake, it is horrible. In matters where even the highest authorities might hesitate to decide, twelve ignorant men are called on to deliver an authoritative verdict. The result is that tbey either act blindly from prejudiee previously conceived, or they accept blindly data given them by men supposed to be skilled, but of whose skill even they are nnable to judge, or they are led away by the specious pleadings and superior persuasiveness of that advocate who knows best how to touch their sensibilities. In no case can tbeir verdict, from the ntter absurdity of the circumstances, have any real value.

Tbe manner in which evidence is procured and taken in such triale ie ill-fated to elicit truth and to furtber tbe ends of justice. One side procuree its scientific witness and the other side procuree its scientifio witnese, each of whom is biassed, by his wishes, interests, passions or pretensions, in favor of the side on whicb he is called to give evidence. He is examined and cross-examined by tbose who wish—not to elicit the truth, the whole truth, and nothing but the truth—but jnst so mnch as will serve their pnrpose. If testimony is to be broken down, a lawyer finds it easy to do ao in appearance at least, on acconnt of the entire ignorance of the jury in scientifio matters. Puzzling qnestions, or such as may serve to embarass a competent authority or *appear* to embarass him, and remarks on matters entirely nnconnected with tbe question at issue, often have more weight, if skillfully applied, on the jury, than any amonnt of valuable evidence.

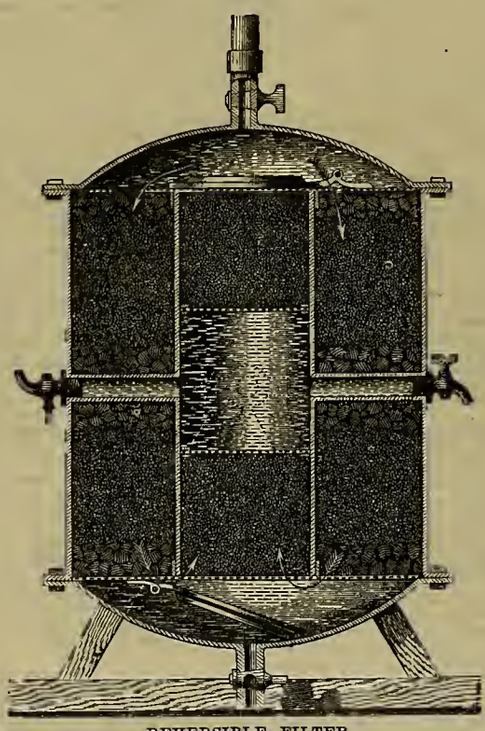
It would seem an elementary principle of common sense that competent men should be called on to decide important questions. No business man would even think of intrnsting his business qnestions of import to persons selected under onr jury-system. It would seem an elementary principle of justice that a prisoner on trial for his life should have the right to claim a jury of men specially competent, or at any rate not absolutely incompetent, to judge of the facts on which his defence is based.

Tbe *American Artisan*, commenting on the Schoeppe trial, advocates a special court or *jury of experts* to pass npon the value of expert evidence in all trials whore such evidence is introduced, their verdict or decision upon this point to be accepted as finel with the jury which passes upon other questions of fact. This snggestion should be followed out. Else we shall be obliged to aweit the "interposition of Providence," in the words of the judge above spoken of, day after day to preveut great wrongs. Bnt the doctrine that we can act as foolishly or as wickedly ae we choose without evil results, on account of the continned interposition of Providence, is as absurd as it is blasphemous.

Reversible Water Filter.

A filter that eannot be reversed, and thns made self-clesning, says the *Scientific American*, is not worth much. A filter tbat does not allow the filtered water to rise, instead of falling, into the pure water chamber, is imperfect.

The accompaning engraving represents a filter adapted to all the purposes for which filters are used, which is essentially a self-cleaning filter, in which the water leaves all its sediment behind as it bubbles up into the pure water ohamber in tbo center of the filter. The filter is supported on central trunnions in a wooden frame, and is turned, end for end, by simply detaching the snpply pipe. The valves act by their own gravity as the filter is reversed.



REVERSIBLE FILTER.

The perforated heads, whioh confine the filtering meterial and secnres the central cylinder, are loose disks held in place by the ontside heeds. For further particulers address H. N. Taft, 18 Lafayette Place, New York City.

The Advance in Iron.

Tbe mining, railroading and mechanical interests heve all been taken by surprise at the greet advance in the price of iron. Fnrnaces and rolling mills that had been lying idle for months and years, are all suddenly celled into requisition, new ones are being constructed and put in operation, and still the price of iron goes up. We believe there is no good reason wby it should be. There has been no material advance in the iron laborers' wages, no advance in the price of coal, and but little, if any, in the transportation of ores or the manufactured iron. We cen eee no greet disperity between the demand and enpply, and yet iron is advancing. It is thue without any good or legitimate cause, and therefore cannot long continue.

Coal.—A valnable coal mine has been discovered abont 25 miles from Virginia, Montana; an important "find" in that part of the country.

A New Motor for Sewing Machines.

For several years it has been tbe aim of a large class of inventors to devise a simple, cbeap and convenient motive power for a sewing machine, and thns do away witb the difficult and injurions treadle movement by whicb these machines have always been run. The great need of such a power has called ont a large number of applications for tbis purpose, amongst whicb we have noticed several methods of applying spring power. In a nnmber of cases weights have been proposed. Quite a number of electro-magnetic motors have been invented, patented and tested, amongst which the most notable of which we have any account is tbe one patented by Stevens & Hurdy, of this city, in whicb the needle arm of tbe mechine was driven directly from the armatures of the electro-msgnets, withont the intervention of a wheel or gear. Water engines have also been suggested, and in several instances applied for this pnrpose, bnt none of the many devices snggested seems to have combined the necessary degree of simplicity, economy and convenience, that the subject demanded by reason of their not having been generally adopted. We next find the inventive talent directed towards improving the treadle, so as to avoid the injuriousmovement of the ordinary treadle, and quite a number of ingenious arrangements have been presented.

But, notwithstending, so many efforts, it remained for an Oakland mechanic and inventor to snggest what to us seems the most simple, economical and practical power yet presented for this purpose. We refer to Isaac Hyde's applicatiou of an ordinary water wheel for driving a sewing machine. As at present constructed an ordinary hurdy-gurdy wheel, about twelve inches in diameter, is nsed. The ordinary driving shaft of the sewing machine is extended to one end of the table, and the wheel is secured npon this extended shaft, a neat case encloses the wheel, and the water for driving the wheel is snpplied throngh a pipe or hose which leads from tbe water pipes, which convey water through the house and is delivered upon the wheel throngh a nozzle of extremely small diameter. The water after being used is conveyed through anotber hose or pipe to any convenient receptacle, where it can be stored for varions household uses. The pipe through which the water is condncted to the wheel passes along under the macbine near the ordinary treadle shaft, and a cock is arranged upon it which is operated by a treadle, so that the operator cen, hy a simple movement of the foot, admit or sbut off the water at pleasure. A recent test of the amount of water reqnired to drive the machine with a wheel of this description showed that three quarts per minute, nnder the pressure in our city pipes, could run the wheel at 900 revolutions per minute. The attachment is very neat in appearance, and in no way complicates the operation or movements of tbe machine. The patent for this invention was procured through the Mining and Scientific Press Patent Agency, and has been assigned to Oscar J. Baokus, of this city, to whom all communications shonld be addressed.

Gold Bluff.—Tbe schooner Witch Queen has returned to Gold Blnff, after having completed the repaire to the diving-bell apparatus, and we will probably hear something definite soon ae to the enccese of the expedition. The auriferons sends at the bottom of the ocean are reported as fabulonsly ricb, and it only remains for them to pump them up and prove that snch is the case.

CORRESPONDENCE.

Mining in Utah—List of Patented Mines—New Improvements in Salt Lake City—Walker House, Etc.

EDITORS PRESS.—Mining in Utah has proved a decided success this past summer. The mines in all of the old districts have been very generally worked, and a number of new districts have been organized, which already are extensively prospected with very promising results. Many large sales have been effected and several companies incorporated with large amounts of capital, who are now actively engaged in developing their property. A great many prospects have been developed into good mines, and those mines which have been worked, seem to prove beyond the possibility of a doubt that our mineral resources are as rich as they are inexhaustible. Several very fine coal beds and iron mountains have been discovered in both the northern and southern portions of the Territory that will prove of immense value to the fortunate owners and discoverers when the iron horse which is now being rapidly extended north and south reaches these respective localities. Sulphur has also been discovered in Fillmore county, and an extensive bismuth mine has been found in Beaver county, which is being worked and is developing finely. Whether or not Utah has proved a resting place for the Saints is a matter of dispute, but that it is destined to be the "miner's paradise" is already a settled question that will not admit of a shadow of doubt, as the country possesses almost every kind of metal known to mineralogy.

For the benefit of the numerous readers of the PRESS, I subjoin a list of those mines which have applied for and received United States Patents, and the respective districts in which they are located;

Mineral District No. 1.—West Mountain District, Salt Lake County:—Winnamuck, Dixon, Galena, Ely, George, Vespasian, Fliess, Merrimac, Yosemite, Dartmouth, Portland, Last Chance, Eagle Bird, Osceola and Lucky Boy consolidated.

Mineral District No. 2.—Lincoln District, Beaver county:—Rollins' Claim.

Mineral District No. 3.—Star District, Beaver county; Mars and Taylor lodes.

Mineral District No. 4.—Little Cottonwood District, Salt Lake county:—Emma, Flagstaff, Last Chance, Lavinia, Hiawatha and Grizzly.

Mineral District No. 5.—Big Cottonwood District, Salt Lake county:—Highland Chief, Sailor Jack, Prince of Wales, Homeward Bound and Congress.

Mineral District No. 6.—East Tintic District, Juab county:—Mammoth, Mammoth Northern Extension, Eureka and Montana.

Mineral District No. 7.—Camp Floyd District, Tooele county:—Marion, Sparrow Hawk, Last Chance, Consolidated Camp Douglas, Silver Star, Silver Circle consolidated, Wandering Boy, Star of the West, Silver Cloud and Silver Cloud Mill Site.

Mineral District No. 8.—American Fork District, Salt Lake county:—Miller, Wyoming, Sierra and Hudson.

Mineral District No. 9.—Ophir District, Tooele county:—San Joaquin, Shamrock, Monarch, Green Chloride, Aristotle and Boston Pet.

Mineral District No. 10.—Stockton or Rush Valley District, Tooele county:—Silver King No. 2 and First Extension West.

Mineral District No. 11.—Ohio District, Piute county:—Homestead and Daniel Webster.

Mineral District No. 12i—Lucine District. Box Elder county:—Independence mine.

The developments made this past season in the different mining camps has created a marvelous change in Salt Lake City. Improvements have been made as it were by the hand of magic, and so rapid has been the march of progress, that the city is almost unrecognizable to its friends of only a year ago. Beautiful cottages have taken the place of many of the old adobe huts built by the first settlers, while larger and more elaborate dwellings, are constantly going up, residences for both saints and sinners. Brigham Young, Jr., has erected a fine residence for his favorite wife, and the Prophet himself not disdaining the good things of earth has broken ground for a residence which is to cost $65,000. Main street, though not quite so bustling as Broadway or Market streets, presents a truly Metropolitan appearance, and the well patronized street railroad should be an encouragement to its proprietors to furnish more accommodations and also to build intersecting lines. Several new buildings are in process of construction for business purposes and it is anticipated that both gas and water works will be completed in the course of a few months. If the march of improvement goes on as rapidly in the future as it has during the past two years, there can be no doubt but that Salt Lake will very soon become the Queen City of the Rocky Mountains. From force of circumstances it must be the mining center of Utah and this fact alone is sufficient to ensure its permanent prosperity.

But the great feature of Salt Lake City at present is the new hotel, the Walker House, which was opened on the first of September by Messrs. H. S. Greeley & Co., who are well known on the Pacific Coast as competent and experienced hotel keepers. This hotel is certainly the finest in every respect betwen Chicago and San Francisco, and would be a credit to either of these cities. It is the universal opinion of those who have seen the estsbliehment that no finer or better furnished hotel can be found this side of New York, and that it reflects the highest credit upon the gentlemen whose enterprise has planned and erected it. The Walker House was built by the Walker Bros., merchants of Salt Lake, and is the largest hotel in Utah Territory. It is four stories high above the basement, and contains one hundred and thirty-two rooms for guests, including twenty-seven suites with private bath rooms attached. In the basement is a fine reading room furnished with all the principal American and foreign newspapers, a bar and a cigar stand, store room and barber shop, which contains five splendid baths. On the first floor are the dining rooms, office, telegraph office and kitchen, all fitted up with the very latest modern improvements, a well stocked news stand and a handsome cigar store. On the second floor are the parlors, elegantly furnished, and several suites of rooms, fitted up with every convenience and luxury.

The remaining floors are occupied with fine rooms, both single and en suite, and on the roof are large water tanks, which is pumped up by the steam engine in the basement, and thence supplied to the different rooms in the house. Telegraph wires connect from the office with every room in the building, and a patent fire alarm gives notice in the office of unusual heat in any room in the house. In brief, the arrangements and style of the Walker House entitles it to a place among the very first-class of hotels in the country, and we hope it may meet with all the success which the enterprise merits. B. A. M. F.

Notes on the Reduction of Gold Ores.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

[Continued.]

In the reduction works of California, the loss of gold appears to be quite as great in amount, and to arise from the same causes as that sustained here; but the system they have adopted for its extraction is somewhat different. Their most approved plan is to crush coarsely in the stamping mill, and then to complete the reduction and amalgamate in circular pans, with mullers revolving on the bottom, which grind the coarse sand from the battery to a fine powder, along with mercury. Numerous contrivances for this purpose have been patented, but Wheeler's pans, lately introduced into this colony, are considered the most effective. From the extensive use of these pans in the treatment of mixed gold and silver ores, it is probable they are well adapted for that purpose, although no statistics have yet reached us that would allow of an exact comparison between the results obtained from them and those obtained by means of the longer-known processes. But I doubt if they would be any improvement on the best plans now in use here for the treatment of our auriferous quartz. Küstel (who is evidently a strong advocate for them) states that with these pans, ninety-five per cent. of the total gold contents can be extracted, *provided the quartz is free from auriferous sulphides*, that is, if it is all free gold that they have to deal with.

But with quartz of this kind, we could obtain nearly the same result from the cheaper plans we now use; and as well nigh all our veins yield sulphides in greater or less quantities, we must face the problem as it is, not as it might be. Judging from the trials already made, and the established principles on which all our operations must be founded, these pans are not likely to work satisfactorily on our pyritous ores, and where the sulphides are in large quantities, much gold would be lost. Some improvement has been made in this respect, by first grinding the sand to the degree of fineness required, and then raising the muller before the mercury is added, so as to have only a rubbing action while they are used for amalgamating. How this pan may answer for extracting the gold from the roasted sulphides has yet to be proved, but for ordinary tailings it will probably be equal to the arastra, that is, it may retain about one-third of the total gold contents of the sand.

The roasting of the quartz previous to crushing was, at one time, an almost universal practice in this colony; but this plan has been gradually abandoned on most of our mining fields, indicating that increased experience has proved the advantage gained was not equivalent to the extra cost incurred. Roasting is still in use on some of our gold-fields, where the sulphides are plentiful, and mercury is used in the coffers. Under these circumstances, the partial decomposition of the sulphides will decrease their tendency to act on the mercury. But it is probable that a still better result would be obtained by crushing the raw quartz without mercury in the coffers, using a concentrating process onteide; and the settling of this point well deserves the attention of the companies interested. Where it is intended to extract the pyritons gold, after the free gold has been obtained, roasting of the quartz before crushing is inadmissable, on account of the partial decomposition of the sulphide increasing the difficulty of separating them from the worthless sand.

In the course of experiments made at Clunes, it was found that the greater the heat to which the quartz was subjected, the greater was the loss of gold sustained. When the sulphides were on the outside of the pieces of quartz enbjected to the roasting process, a glazed slag (mixed silicates of iron and alumina) was formed, and throughout this slag part of the gold was distributed in minute particles, invisible to the naked eye. In the interior joints,—where only partial decomposition had taken place—black veins of melted sulphides were formed, with which the gold appeared to be intimately intermixed, instead of collecting together. The affinity of the mercury for the free gold was greatly affected, and this has generally been ascribed to the coating of the gold with a fine film of sulphur, although careful microscopic examination, with high powers, failed to detect any trace of this film. Lately, Mr. Latta has discovered that bringing gold up to a red heat produces the same effect,—the change being evidently confined to the exposed surface, as it disappears on this surface being broken.

When antimony is present in the quartz in quantities that will affect the mercury, it might be advisable to roast before crushing, for the purpose of volatilising the antimony. But even in these cases, it has yet to be seen whether still better results would not be obtained by depending on the concentrating process, and treating all the concentrated material in the same way as is used for the extraction of the pyritous gold.

Keeping before us the great loss inevitably sustained in the reduction of gold ores, even with the best appliances known,* it will be readily seen how greatly that lose may be increased by any carelessness or want of knowledge on the part of those in charge of the works. In nearly all the crushing establishments of this colony the work is carried on from day to day without an attempt being made to discover what is the amount lost, and in what form that loss occurs. Yet it will be seen from the above details, that any person having the control of these operations, should not only be acquainted with the principles on which they ought to be founded, but that he should be prepared to enter into the investigations required to enable him to ascertain the comparative efficiency of each part of the process.

For this purpose the mercury used should be carefully weighed at short intervals, to ascertain what the loss is, and in what part of the process it occurs. The tailings should also be sampled as they leave the crushing-house several times during the day, and the accumulated samples tested at the end of each week or fortnight, to ascertain what amount of gold is being lost. These samples may be sent to any competent assayer, where exact returns are required; but for ordinary work, rough assays by amalgamation, on the plan described in the Appendix, will be sufficiently accurate for general use; as these will come within fifteen per cent. of the actual gold contents, provided they are made with due care. Records should be kept of all these assays, and regular returns made, not only of the amount of gold obtained, but also of the gold and mercury lost, with full information as to how and where that loss occurs. The rough and ready system of dealing with the nice question of the extraction of gold, has been so long in use in this colony, that many will be surprised at the proposal that they should require such returns from the managers of mines, yet they are made regularly in the gold mines of Europe and South America, and in at least one of our large mines. Without them, companies are working entirely in the dark, and that in conducting operations where the loss at the best is very great. It might be supposed that there are not many companies in this colony so apathetic as to prefer remaining in ignorance of the extent of their loss, rather than enter on the active endeavor to reduce it, such knowledge would force them into. The outlay of a few shillings per week for material, and a little extra work for the manager, can hardly be considered a sufficient excuse for not prosecuting these investigations, and there can be no doubt they would result in a largely increased yield of gold.

The above notes refer to the extraction of the free gold only, and the treatment required to obtain the pyritous gold, the form in which probably eighty per cent. of the loss now sustained occurs, has yet to be considered.

The ores with which a great part of the gold now lost, is incorporated, are the iron and arsenial pyrites, the former being usually the richest in gold. They are found in greater or less quantities in all our quartz veins, the proportion in some cases reaching as high as ten per cent. of the vein stone, and varying in gold contents from a trace up to fifty ounces per ton.

Instances have been known where the sulphides have yielded over one thousand ounces of gold per ton, but these were no doubt exceptional cases. As a general rule, the value of the sulphides will be in proportion to their percentage in the quartz, and the amount of free gold obtainable by the ordinary process. While the sulphides in the heart of the vein may be rich, those in the slate immediately adjoining it are usually poor; and even in the vein itself there is great difference in their value. No trial of a single sample will, therefore, be any criterion of the average yield of the sulphides in a vein; any more than such trial would be of the average yield of the quartz.

The best test is to take a fair sample of the ordinary waste tailings, or the waste blanket sand, after the free gold has been extracted by the methods in use for that purpose, wash out the sulphides, and take a sample for assay. If this is done with due care, some trust may be placed in the results obtained; but the necessity for this care cannot be too strongly enforced, lest companies should be led into unwarranted expenditure in the endeavor to obtain gold which may not exist.

It may not be out of place to note here the principal characteristics of the iron ores to be treated.

The iron pyrites is a bisulphide of iron, crystallizing in the form of the cube. The color varies from bronze yellow to nearly silver white.

Faces of the crystals frequently striated. Brittle, but does not yield to the knife, and by this property it may be distinguished from copper pyrites, which it readily scratches. Specific gravity, from 4·6 to 5.

Chemical composition—Iron, 45 to 48 parts. Sulphur, 52 to 54 parts.

Arsenical pyrites crystallizes in the form of the rhomboid; the color is usually whiter than the iron pyrites. Specific quartz, 5·7 to 6·2.

Chemical Composition—Iron, 35 to 36 parts. Sulphur, 20 to 21 parts. Arsenic, 43 to 45 parts.

These ores are usually found together in the veins, sometimes one, sometimes the other, predominating. Galena is frequently associated with them; the chemical composition of this ore being—

Lead, 85 parts. Sulphur, 13 parts.

A trace of gold in chemical combination has been found in the iron ores, but the quantity was so little that it may be left out of the calculation, nearly all the gold being deposited mechanically, in minute particles in the sulphides, great part of them so small as to be invisible to the naked eye, and some of them requiring a good microscope to determine whether they are gold or not.

[To be continued.]

* The losses sustained in other gold-mining countries are very heavy, as the appended return, extracted from the *Journal of the Society of Arts*, will show:—

St. John del Rey (Brazils)	loss 30	per cent.
Brazils generally	" 30 to 35	cent.
Piedmont	" 35	per cent.
Zell	" 35 to 40	cent.
Hungary and the Tyrol	" 50	per cent.
Chili	" 66	per cent.

Kern County Mines.

The mining prospects of our county have not been for many years so encouraging as now. Its existence is no longer an experiment. The results of practical working, on a small scale, have demonstrated that the mines of Kern county are as rich, with a few exceptions, as any on the coast. The close proximity of the railroad, in a short time, will bring our mines to the gates of the sea, and put us in communication with all lands. Our resources, both agricultural and mineral, will become known, and as a consequence an influx of population and capital will follow; our mines will be opened and the thousands of acres of untilled lands in the Great Valley, Tehatchipah, South Fork and Linns Valley will, to a certain extent, be put under a high state of cultivation. Our mountains of gold will be made by the introduction of capital to yield up their wealth of untold millions, which now lies locked up in their ledges for want of developing power, enterprise and capital.

The late discoveries of new mines show that our mineral region contains large quantities of gold, yet; and corroborate the fact that our district is of considerable extent—more so than heretofore supposed.

Improved processes for the reduction of ores are being introduced throughout the mining regions of the world; and Swansea's secret power of reducing ores is becoming equalled. It is cheaper for Swansea to come to our mineral mountains than to move them to Swansea; and sooner or later she will have to succumb to Pacific Coast mines. The question of an opposition company to that of Swansea being formed in San Francisco has been talked of; if started, with equally as good reduction powers as Swansea possesses, we will see a new era in mining operations on this coast.

Parties have gone from here to San Francisco for the purpose of negotiating with capitalists who have already signified their intention of starting the Joe Walker mine. It is said that the water can be taken out for about $20,000 and that active operations can be resumed by an expenditure of $30,000, all told.

The mines of Kernville are looking up. The Bright Star and St. John mines are doing better than ever, and the McKeadney and Jupiter mines hold their own. We possess the mines, now let us interest capital and open them.—*Havilah Miner.*

MONTANA FAIR.—At the late Fair of the Montana Agricultural, Mineral and Mechanical Association, a considerable amount of gold, silver and copper ores was placed on exhibition. Hobert & Barton of the Star mine, Mullen Pass, received a premium for coal; Geo. McBurney also received one for building stone; Lewis, Bull & Co., Legal Tender mine, Jefferson county, premium for silver quartz; also for galena, both varieties from the same ledge; T. H. Klemeclimidt received a premium for a general collection of ores; a cabinet was also exhibited by G. E. McKiernan. Other ores and minerals were exhibited which were not entered for premiums. We are glad to see the general interest being manifested in the exhibition of mineral products, which should bear as conspicuous a place as agricultural in the Fairs of the Pacific States and Territories.

SCIENTIFIC PROGRESS.

Climatic Changes on the Earth.

At the last meeting of the California Acadsmy of Sciences Professor Geo. Davidson, President of the Academy, read an interesting paper sntitled "Suggestive of a Cosmical Cause for the Great Climatic Changes npon ths Earth." The paper had previously been snhmitted to Professor Agassiz who considsrsd it a new idea and worthy of promulgation. It read as follows:

Disliking theories and hypothesis, I must characterize as a suggestion what I have to state npon this subject. So far as I am aware, geologists have failed to indicate any reasonable or rational cause for the sub-tropical fossil flora and fanna found within the Arctic circle, and for the great ice shest—the nniversal glacier—which donbtless covered nearly the whole land from the poles toward the tropics at a comparatively recent period. To mention is to condemn the extravagant hypothesis of the changing of the direction of the earth's axis, as it involves changes necessarily of greater amount than the motion of a boy's top. Partial npheavals and great changes of the surface of the earth are insufficient to acconnt for the phenomena.

The palæontologist has roughly indicated by his zones of fossil flora, and fossil fanna, that the pole of the earth has not changed its direction, and the astronomer utterly rejects such a change. My suggestion is that we must look to a coemical cause for these phenomena, and that cause is in the material or materials burning upon the snrface of the snn.

The spectroscope has made known to us the connection between sudden outbursts of storms npon the snn's surface, and the exhibition of magnetic phenomena. This instrument has revealed to us a sun wherein a sudden outburst of luminous hydrogen, has increased the brilliancy of a star from the ninth to the second magnitude, and its comparative slow return to its formor condition.

It appears to me that herein we strike the key-note of the canses at work to solve our problem of short or long periods of varying climate npon the earth. If the above phenomenon is possible in one snn, it is possible in every one of the millions of millions of suns aronnd ns, and of course in ours. That such an eruption of burning hydrogen affected the planets revolving around that snn we cannot for one instant douht. To our instruments it was an exhibition of force lasting hut a few months, and its effect upon probable planets around that sun we can never know. Doubtless all new stars that have suddenly appeared with great brillancy were the exhibitions of similar forces. If such forces are possible for short periods, they are possible, and to my mind, more probable for comparatively long periods.

In onr snn the forces are evolved in irregular and also in moderately regular periods or cycles; and mnst have an infineuce npon the general climate of the earth and of the other planets. Even in this year of exceptionable heat over the earth, we have the resnlt of the spectroscope revealing an nnusual dsvelopment of incandescent magnesium over the sun's surface. If these forces of the sun exhibit themselves in short and long periods, we can comprehend how periods of almost nniversal flood, of earthquake and volcanic action, of a climate to develop sub-tropical fauna and flora, even within the Arctic circle; if a great ice sheet spreading from each pole over the land toward and even embracing the equator, may be not only probable, but place the two latter in full accord with the astronomical dictum that no violent change of the direction of the earth's axis is admissible. The spectrocope is the present means of gathering observations to test my suggestions, or to develop a law nnderlying these changes; and as we observe the exhibitions of the forces upon the surface of our sun, and note the effects upon the earth, we can also watch the changes npon Mars and the other near planets. But we cannot hope to determine the law of connection within a short time, unless some wonderful event happened in our sun similar to the sudden ontburst of luminons hydrogen in the star in the Northern Crown, to show us in an hour the effect that such great cosmical changes have npon the earth and other planets of our system; or unlsss other instrumental means, far beyond the capacity of the spectroscope, be devised to show minute connections between changes on the sun's surface and limited periods of earth phenomena, such as years of great heat, and earthqnake and volcanic activity, perhaps even years of peetilence, a long cycle of years may be required to demonstrate whether a law lies at the base of my suggestions.

Like the observers who make their measures to determine the gradual elevation or subsidence of continental shores, we may not learn the result, but we can aggregate observations for discussion by the next generation.

A RED COLOR has sometimes been observed in white lead, and has been formerly attributed to the preeence of silver. German investigations have recently shown that this is incorrect, and that the red tinge is due to defects in manufacture.

Boring for Science.

It sssms that the bors hole which is to bo pnt down in Englsnd, is not so mnch for the sake of discovering coal as to ascertain what the lower formations rsally are. The project is due to Mr. Willstt, and ho was incited to ths proposal by thinking of aome fitting method of greeting the British Association on its visit to Brighton. The happy thonght struck him that scientifio men could not he better met than by a scientifio work. Upon inquiry ho found that that not one single experiment for pursly scisntifio purposss in ths Southsast of England had svsr bssn made. He therefore considsred himself fortunate in having hit upon a problem yet unsolved. Hs pronounced the purposs of ths work to be "To ascsrtain (by actual experiment of a horing) the nature and thickness of the geological strata lying immediately beneath the lowsst seriss of the Wealdsn formation in Knt and Sussex (known as the Ashburnham beds). Thereby to put an end to the differsnce of opinion among scientifio men on the subject, who may otherwise continns to form adverse speculations for anothsr csntury. Subordinately, to ascertain whsther carhoniferous strata (as in Belginm and tbe Boulonnais district in France) extond ncross the channel in this direction. To endeavor to reach Palæozoic rocks, if such exist within 2,000 feet of the surface, and to ascertain the temperatures of the rocks (snccessively reached), by the methods and instruments recommended by the British Asseciation Committee ou Snhterranean Temperatnres." The bore hole will be nine inches in diameter, and the estimates of the depth to be snnk are max. 1,350 feet; min. 730 feet. The site is at the Councellors Wood, in the county of Sussex.—*Eng. and Min. Jour.*

Has Our Climate Changed.

Under the above heading a writer in the *Popular Science Monthly* gives conclnsive arguments in the negative. From the averages of observations made at Boston, New York, Philadelphia and Charleston it would seem that, so far from changing, the averages of each decade for the last one hundred years have been strikingly near equivilence. We constantly meet with statements in the press of the country made by *psuedo-savants* to the effect that our climate is becoming more extreme and the rainfall less. So frequent have been these assertions that most intelligent persons whose means of arriving at the figures in the case are limited, have had no doubt of the truth of these assertions. Yet, if the data cited by this writer are correct, there would seem to be no shadow of basis in the truth of either assertion. What a study of the meteorological variations of the climate extending over several hundred years would show there is no knowing, but it is fair to suppose that there has been no great change. That there are cycles of climatic phenomena is undoubted, bnt their recurrence is marked by no great change in the averages, such as should lead us to believe that our climate is becoming more extreme. As far as imperfect observations go, it would seem that there have been no considerable changes in the climate of any country within the last thousand years.

A TRUE AND REAL SCIENTIST.—The illnstrious chemist, Scheele, of Sweden, lived and died an humble apothecary, in the little town of Koping. Althongh he died at the age of forty-three, his career as an investigator is unequslled in brillancy, especsially considering the fact that he had only the simplest apparatus and vesssls that he could contrive and make for himself. He examined the question of changing water into earth, discovered oxygen and nitrogen in the air, chlorine, manganess, barytes, tungsten, molybdenum, prussic acid, hydrofluoric acid, glycerine, and citric, tartaric, oxalic, malic, tannic, uric, and lactic acids.

When the King of Sweeden visited Paris, Lavoisier and all the learned men inquired about Scheele, but the King had never heard of him. He wrote home at once and ordered his ministers to look him up. The only Scheele who could be found was a clerk in one of the government offices, so he was knighted and pensioned. But when the king returned the real Scheele was found, and offered every inducsment to take up his residence in Stockholm, but he preferred his shop in Koping, and lived and died in his little laboratory. *Prof. Chandler.*

BAROMETRIO PRESSURE AND LIFE.—Mr. Paul Best hae shown that in the destruction of life by diminishing barometric pressure, the direct canse is the deficiency of oxygen, and that an animal that will die with a pressnre reduced to eighteen cm. (seven inches) will endure a redsnction to six cm. (2.4 inches) before life is extinct, if oxygen be added. The converse is also true, that the evil of great pressure comes mainly from the too large amount, in that case, of oxygen, dilution with oxygen prolonging life. Workmen employed at great elevations would accordingly find benefit in an arrangement for supplying more oxygen; and those occupied in diving for pearls, etc., by a contrivance for supplying nitrogen.—*Les Mondes.*

THE GREENLAND METEORITES. — Professor Nordenskjöld has communicated to ths Geological Society a paper on the remarkable masses of meteoric iron from Greenland, discovered in 1870 at Ovifak, and brought home last year by the Swedish expedition under Baron von Otter. They are the chief masses of an enormous meteoric fall which probably occurred during ths miocene period, and extended over an area of two hundred English miles, embracing not only that region occupied by ths Greenland basalt, but a country composed of granite-gneiss.

Within an area of at most fifty sqnare meters were found sixteen meteorites, the weights of which, in Swedish pounds, ars as follows: 50,000, 20,000, 9,000, 336, 230, 200, 191, 150, 150, 150, 100, 56, 42, 15, 8, and 6. The three largest have ths following diameters respectively: 2 by 1·7 meters, 1·3 by 1·27 meters, and 1·15 by 0·85 meters. Nearly 100 pounds of lendicular shaped fragments of iron, from three to four inches in thickness, were also taken out of ths basaltic dyke close to them. All the masses contain nickel and carbon.

HIGHTS IN COLORADO.—From Prof. Thomas' list of elevations we find that Colorado has six mountains with summits over 14,000 feet above the level of the sea. These six are:

Mount Howard	14 270	feet.
Pike's Peak	14 216	"
Gray's Peak	14 145	"
Mount Lincoln	14 123	"
Mount Yale	14 078	"
Long's Peak	14 056	"

Colorado might be said to be a "high old place," if people were in the habit of using such slang phrases.

THE SIGNAL BUREAU AND STORMS.—The great storm that swept over the lakes on the 28th and 29th of Septemher afforded another proof of the utility of the signal bureau. Its approach was announced in the morning "Probabilities" of the 28th, and on the afternoon of that date the danger became so apparent that cautionary signals were ordered out at Buffalo, Chicago, Cleveland, Detroit, Grand Haven, Milwaukee, Toledo, Oswego and Rochester hours before the storm reached either of these places.

MECHANICAL PROGRESS.

Manufacturing Statistics.

The tabulation of the statistics of manufactures of the United States for the year ending June 1, 1870, as returned at the ninth census, has jnst been completed at the Census Office. The number of establishments is 252,148; nnmber of steam engines, 40,191, with a horsepower of 1,215,711; number of water-wheels, 51,017, with a horse-power of 1,130,416. The average number of hands employed dnring the year was 2,053,988, of whom 1,615,594 were males above sixteen years of age, 323,768 females above fifteen, and 114,626 children and growth. The amount of capital invested was $2,118,247,069, of wages paid $775,621,593. The value of material consumed was $2,488,291,952, of products $4,232,625,892. Of this production $13,040,644 is returned from Alabama, $185.410 from Arizona, $4,629,234 from Arkansas, $63,594,556 from California, $2,852,820 from Colorado, $161,065,474, from Connecticut, $178,570 from Dakota, $16,791,382 from Delaware, $9,292,173 from the District of Columbia, $4,685,403 from Florida, $831,196,115 from Georgia, $1,047,625 from Idaho, $205,620,672 from Illinois, $108,617,278 from Indiana, $46,534,322 from Iowa, $11,775,823 from Kansas. $54,625,809 from Kentucky, $24,161,905 from Louisiana, $79,497,521 from Maine, $76,593,613 from Maryland, $553,912,568 from Massachusetts, $118,394,670 from Michigan, $23,110,700 from Minnesota, $8,154,758 from Mississippi, $200,213,429 from Missouri, $2,494,511 from Montana, $5,738,512 from Nebraska, $15,870,539 from Nevada, $71,038,249 from New Hampshire, $169,237,722 from New Jersey, $1,489,868 from New Mexico, $785,194,651 from New York, $1,921,327 from North Carolina, $269,713,610 from Ohio, $6,877,387 from Oregon, $712,178,941 from Pennsylvania, $111,418,354 from Rhode Island, $985,898 from South Carolina, $34,362,626 from Tennessee, $11,517,302 from Texas, $2,343,019 from Utah, $32,184,606 from Vermont, $38,364,322 from Virginia, $2,851,052 from Washington Territory, $24,118,051 from West Virginia, $77,214,326 from Wisconsin, $765.424 from Wyoming.

HIGH PUMPING.—We are informed of some tall pumping at Triumph, Penn., where the water has to be lifted from the Alleghany river to the summit of Triumph Hill, a vertical hight of six hundred and eighty-five feet, or more than twice as high as Trinity church steeple. The horizontal distance is two and three-qnarter miles. The pressure per square inch in the water cylinders of the steam pumps is seven hundred pounds. Three pumps are used, each lifting two hundred thousand gallons every twenty-four hours. This water is designed for supplying the boilers of the steam engines used at the oil wells in the vicinity. The steam pumps have a piston stroke of eighteen inches; the diameters of the steam and water cylinders are respectively twenty inches, and six and one half inches. The pressure above mentioned in the water cylinder is notable as closely approaching that ordinarily employed in the cylinders of hydraulic presses.—*Am. Artisan.*

DREDGING ON OCEAN BARS.—Major General Gilmors describes in *Van Nostrand*, for September, the apparatus and method employed for deepening the channel over the bar at the mouth of the St. John's River, Florida. Upon this bar the constant ocean swell is of such exceptional magnitude and violence that the usnal method of dredging into lighters or scows, ordinarily pursued in still water, is entirely impracticable. Hence a steamer was fitted with a nine-inch centrifugal drainage pump (Andrew's), which had a suction and a discharge opening each nine inches in diameter. To the suction-opening was attached two six-inch snction-pipes, so as to be able to work on both sides of the boat simultaneously. A portion of each suction-pips was made flexible (of rubber hoss) to prevent the end from being lifted off ths bottom by ths pitching of ths boat. Each end also was loaded with an iron frame or drag, weighing 250 lbs., which moves flat along the bottom during the operation of dredging. To this, directly below the pipe, are attached knives which stir up the sand. The pump-engine was driven by steam from the steamer boiler, and the sand was sucked up into hins on board ths vessel.

The steamer starts from the outside of the har, moving slowly, with pipes lowersd and engine pumping np ths sand. Arriving at the insids, ths pump is stopped, ths pipes are raised and ths steamer is turned around. She crosses slowly to the outside, pumping as before. While the steamer is turning around again, on the outside, the snction pipes are raised from the bottom, the side gates of the hins are opened, and the pump is run at full speed in clear water, which discharges the sand from the bins into deep water. In seven months, with 622¾ working hours, 36,969 cnbic yards of sand were removed at an expense (exclusive of cost of pump and outfit) of $19,870.

APPARATUS FOR EXCAVATING BENEATH THE SURFACE OF WATER.—The completion of the great well—fifty feet in diameter—in Central Park, New York, presented an uncommon mechanical problem, and showed, by its solution, the advantages of scientific edncation. It became necessary to dig the well twelve feet below the source of the water supply. The question presented was to do this in a rapid and economical manner. The New York *Price Current* describes the process adopted:

The apparatus consisted of a strong iron cylinder, three and one-third feet high, and one and a third in diameter, made air-tight in its sides and top, hnt entirely open at the botton; the edge at the bottom being made thin and sharp. The top was provided with two valves which could readily he opened or shut; also with a strong wooden stem six inches square and eight feet long, the whole attached to a proper hoisting apparatus. When this cylinder was lowered into the water, the valves were forced open and the air escaped; then by working the wooden stem back and forth, the cylinder settled of its own weight and filled with sand, when the valves were closed and the upward pressure of the water kept the sand from falling out as the load was raised to near the surface and there deposited on a platform, from which it was afterward removed by ordinsry appliances. By this apparatus five cubic feet of sand were easily taken from the bottom of the well every two minutes.

TO CUT ANN BORE INDIA RUBBER STOPPERS.—Dip the knife, or cork borer, in solution of caustic potash or soda. The strength is of very little consequence, but it should not be weaker than the ordinary regent solution. Alcohol is generally recommended, and it works well until it evaporates, which is generally long before the cork is cut or bored through, and more has to be applied; water acts just as well as alcohol, and lasts longer. When, however, a tolerably sharp knife is moistened with soda lye, it goes through India rubber quite as easily as through common cork; and the same may be said of a cork borer, of whatever sizs. I have frequently bored inch holes in large caoutchonc stoppers, perfectly smooth and cylindrical, by this method. In order to finish the hole without the nsual contraction of its diameter, the stopper shonld he held firmly against a flat surface of common cork till the borer passes into the latter.—*W. Donkin, in Chemical News.*

TINNING WITH ZINC INSTEAD OF TIN. — C. Mene.—The author calls attention to a frand which, in France, at least, seems to be on the increase, viz., that of using zinc instead of tin for the purpose of lining copper vessels, which are in general nee for cooking purposes in France; zinc being readily acted upon by weak acids vinegar, etc., yields poisonous compounds. In order to test the tinning, the author recommends the boiling of vinegar in the vessel; if the surface remains bright, genuine tin has been used, but if the metallio surface becomes tarnished, zinc may be suspected to have been substituted, and further research will be required before using the vessel for cooking purposes.—*French Journal.*

A NEW THEONOLITE.—An engineer of Syria, Haddan by name, has constructed a theodolite on a new system. With this instrument angles are said to be measured with hitherto unattainable accuracy. The telescope is made to revolve with great regularity around a vertical axis, making a revolution in a certain accurately determined time. The angle is measnred by the *time* occupied by the telescope in making this angle. Where the greatest accnracy is requisite, the telescope revolves once in twelve hours. Evidently Mr. Haddan takes heed of the proverb that "haste makes waste."

S. F. Stock and Exchange Board.

THURSDAY, October 17, 1872.

The sales at the Board for the week ending October 9th amounted to $2,374,000. Imperial was the feature. The excitement in the Stock circles this week was the election of the Eureka Consolidated Mining Company which resulted contrary to the expectation of many; an account of this matter will be fonnd in another column. The leading stocks sold this week are as follows: Meadow Valley, 11,965 shares; Imperial, 10,340 shares; Julia, 5,915; Huhn & Hunt, 5,200; Chief of Hill, 2,875; Amador Tunnel, 2,720; Savage, 2,515; Phœnix, 2,380; Belcher, 2,333; and Ophir, 2,225. Rumors of rich strikes in the drifts in both the 1500 and 1600 ft. levels of the Imperial, gave the stock of that mine a start, and accounts for the large nnmber of shares sold. The miners were shut up in the mine as usual, and the stock advanced. An assessment of $1, amounting to $100,000 has been levied on the stock this month. No new developments in the snit of the Kentucky against the Raymond & Ely mine have occurred. Mining assessments delinquent this month are as follows: American Flag, $60,000; Alaska Cons., $3,750; Atlantic and Pacific, $8,000; Bowery, $30,000; Caledonia, $40,000; Chapman, $15,000; Cook & Geyer. $12,000; Condor, $25,000; Dauey, $24,000; Fallis, $7,500; Golden Chariot, $10,000; Globe, $20,000; Huhn & Hunt, $30,000; Kinston, $15,000; Lyons & Wheeler, $5,000; Louise, $15,000; Minnesota, $10,000; Newark, $24,000; Succor, $22,800; Savage, $160,000; Sonth Chariot, $10,000; Washington & Creole; $15,000; Yuba Gravel, $2,500. There are 24 of these assessments amounting to $584,550, and only one dividend to offset them, that of the Raymond & Ely mine, amounting to $210,000; this leaves $374,550 on the wrong side of the account for this mouth. During the last six months 92 assessments have become delinqnent, amounting to $2,008,610, and 22 dividends have been paid, amounting to $4,090,000, leaving a balance in favor of shareholders of $2,081,390, a very small amount compared to the disbursements. In May the assessments were $351,750, and the dividends $1,067,000, leaving in favor of shareholders for that month $715,250. This mouth the reverse of this has taken place. We should hear of more paying minee, taking into consideration the great dieproportiou of dividend and non-dividend companies.

On Friday the stocks were a little firmer than on previous day. From highest ratee on previoue morning Yellow Jacket advanced $9, Belcher, Crown Point and Ophir, each $5; Hale & Norcrosss, $3; Consolidated Virginia, 2; Chollar-Potosi aud Savage, each $1. Gould & Curry declined $5; Kentuck, $4.50; Segregated Belcher, $4, and Exchequer, $2.

Saturday the market was pretty steady considering the state of the money market. From highest sales on Friday morning Crown Point advanced, $8; Overman, $3.50; Chollar Potosi, Confidence, Pioche and War Eagle each, $1. Raymond & Ely declined, $6; Belcher, $4; Consolidated Virginia, $3.50. Ophir and Savage each, $3; Yellow Jacket, $2; and American Flag, $1.

On Monday the market was steady and prices generally firm. At the afternoon Board the market was more active and prices closed generally better. Belcher was $2 higher; Crown Point, $4; Savage, $10; Pioche, $1; Amador, Tunnel, $1; Meadow Valley, $4; Raymond & Ely was $3 lower; Chief of the Hill, 50 cts; Chollar, $1; Imperial, $1; Empire Mill, 75 cents.

On Tuesday there was a moderate amount of business done with no material change in prices. Consolidated Virginia and Overman each advanced $2; and Belcher, Chollar-Potosi, Ophir and Yellow Jacket each $1; Raymond & Ely advanced $19.

Wednesday the sales and business were light at lower prices. Gould & Curry advanced $11; Ophir, 5; and Overman $1; Yellow Jacket declined $1; Crown Point and Savage, each $3 Segregated Belcher, $2; Chollar-Potosi, $150; and Alpha and Caledonia each $1.

To-day stocks were more active and prices a little better. Crown Point advanced $10, Yellow Jacket, $5.50; American Flag, $20; Chollar, $1; Con Virginia, $1; Ophir $2.

Below will be found news from the prominent mines, later than that found in our MINING SUMMARY.

CHOLLAR POTOSI.—During the week ending October 16, 1,925 tons of ore was extracted and sent to mill of au average assay value of $28.34 per ton.

HALE & NORCROSS.—For week ending October 12th, 825 tons of ore were extracted, 718 sent to mill, and 1,070 tons remain on dump. No now developments have taken place in the mine.

SAVAGE.—From this mine during week ending October 12th, 742 tons assaying $33.25 per ton, were extracted; 742 tons delivered at mills, and 385 tons remain on the dumps. A large portion of this ore came from the north mine, second station; the old mine. however, produced 241 tons.

RAYMOND & ELY.—Last shipment of bnllion was $32,821; previous shipmente for month, $101,684 ;] total, $134,505, equal to $10,347 per day. The mine ie yielding about 100 tone of first class and 20 tone of second class ore per day.

PHŒNIX.—On the 8th inst $10,197 was shipped. Aesay value, gold and silver, $269.17 per ton. On the 10th inst. 10 bare of bullion were ehipped, valued at $4,790; assay value in gold and silver, $359 per tou. On the 12th 15 tons of bullion were shipped, valued at $6,601. On the 14th 10 bars were shipped, valued at $4,860. The mine is looking well, turning out about eight tons a day of an average value of over $400 per ton.

Reports from the PROOHE mine say there is great improvement in the first and second levels, with better ore, although the ledge is quite small.

The sonth drifts on both the 1500 and 1600 feet levels of the IMPERIAL show heavy bodies of ore.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

SILVER GLANCE.—Monitor *Miner*, Oct. 5: The Silver Glance shaft is progressing finely, and the ore vein is enlarging.

AMADOR COUNTY.

KENNEDY.—Amador *Ledger*, Oct. 12: The first of the present week the Kennedy made a clean-up of a little over $8,000 after 15 day's run. A fine large shaft is being sunk about 200 ft. southeast from the mill.

BACON.—The rock at the bottom of the present shaft prospects very flattering and the walls are well defined, with every indication of being permanent.

ANOTHER MINE.—The Kearsing Bros. are sinking a shaft in the bed of Jackson oreek and have struck a fine-appearing ledge only a few feet below the surface.

EAGLE.—The owners are taking steps to open up and prospect the lead, and as soon as practicable a shaft will be sunk so as to intersect the lead abont 100 ft. deep.

CALAVERAS.

UP COUNTRY.—Calaveras *Chronicle*, Oct 12: Railroad Flat Dis. The Freeman Bros'. mine is being worked again by a Washoe Oo. A tunnel has been etarted a few feet above high water mark of the South Fork, ehowing splendid walle but no ore ae yet. The new tunnel of the Herzer, some 300 ft. above the level of the South Fork, is expected to meet the north chimney in a few daye.

GWIN.—On Thursday last we were shown the product of twelve day's run of 16 stamps at the Gwin. There wae $12,000 of the "stuff." The south shaft is down 580 ft., and the ledge has widened out to 7 ft. The yield from 16 atsmps has averaged $20,000 per month for sometime past. When the shaft reaches 600 ft. stoping will be commenced and a much larger number of stamps kept in motion than at present. Stoping has begun in the central shaft, at 200 ft., and a fair quality of rock is being extracted.

BLUE MT.—The Heckendorn Co.'s 18 stamp mill is in full operation crushing rich quartz from that lode.

Work on the Imperatrice and Prince Imperial mines is progressing rapidly.

Work on Good Hunter is to be resumed.

RAILROAD FLAT DIST.—Petticoat running levels north and south at the depth of 450 ft. The fissure is from 8 to 12 ft. wide. The Sanderson is again free of water and the contractor commenced sinking.

MOSQUITO DIST.—Twenty tons of Grasshopper ore yielded $2,150. The dump of the mine is filling again with better ore. S. Smith & Co.'s mine yields at the rate of 8 tons per day. Nearly 100 tons of high grade on dump.

WEST POINT DIST.—The Blazing Star has been leased for 6 months. The Pasco is to be put in working condition. The shaft 60 ft. deep is located on a chimney over 300 ft. in length, the ore is from 1 to 3½ ft. wide and yielded as high as $96 per ton.

SHEEP RANCH.—San Andreas *Citizen*, Oct. 12: Ferguson & Wallace cleaned up their mill again last Saturday, and the result was $1,400. The rock averaged a trifle over $50 per ton.

KERN COUNTY.

GRIZZLY BEAR MT. DIST.—Havilah *Miner*, Oct. 5: Several valuable mines have been discovered lately.

TO BE WOKED.—Several abandoned mines in Kelsey Cañon are about to be worked on an extensive scale.

NEVADA COUNTY.

GOOD.—Grass Valley *Union*, Oct. 10: The Buchanan above Nevada city had another crushing; 23 tons of rock yielded $32 per ton; a total of $734.

MINING HEREABOUTS.—Nevsda *Transcript*, Oct. 8: Recently the developments in this vicinity have been most encouraging. The older minee appear to be yielding well and the recent prospecte are excellent. The Penneylvania Co. has reached about 900 ft. on the incline, and are abont running off from the latter. The ledge on both sidee looks first rate. The Gold Tunnel ie very rich, it being estimated that the rock ie worth fully $100 per ton. The Providence ledge is said to be from 4 to 5 ft. thick, and the rock of first grade. The Murchie continues to yield handsomely.

Pioche S. M. Co.

GOLD TUNNEL.—A splendid ledge has been struck in the Gold Tunnel at a depth of over 500 ft. The rock is very rich and the ledge of good size.

PROVIDENCE.—The lessees have struck a first rate ledge, from 4 to 5 ft. thick, and the rock is very rich.

SOOOS.—First rate rock was struck a few days ago in the old Soggs mine on Deer Creek.

PLACER COUNTY.

PICATUNE.—Placer *Herald*, Oct. 12: The shaft is down 80 ft. on a fine prospecting ledge, 4 ft. thick, with smooth solid walls. The owners have out 140 tons of ore that has prospected so finely and uniformly from the top down that they have gone to the expense of erecting a new and complete 10-stamp quartz mill, propelled by water, which is ready to commence crushing ore.

SISKIYOU COUNTY.

RICH.—Yreka *Union*, Oct. 5: Two miners have recently opened a claim in a bar on the Klamath River which is proving very rich.

TUOLUMNE COUNTY.

RICH.—Sonoma *Democrat*, Oct. 12: Mr. Hill struck some rich rock on Turnback Creek above Cherokee, one day of the present week.

Nevada.

EUREKA DISTRICT.

RUNNING.—Enreka *Sentinel*, Oct. 8: The new furnace of the Phenix Co. fired up Saturday night is running successfully.

The mines are looking splendidly. On the 400-ft. level a drift is being run for the ledge with indications favorable for a speedy and valuable development.

SILVER WEST FURNACE.—This furnace has been running continuously over 30 days, and the daily average of ore smelted has been over 48 tons. The average value per ton of the bullion has been $305.

ELY DISTRICT.

REVIEW.—Pioche *Record*, Oct. 6: The amount of bullion for the week is $50,084.16.

CHIEF OF THE HILL.—About 10 tons of high grade ore are being raised daily from the second and third levels. Out the third level the west drift is being pushed, also two winzes, which are being sunk at a distance of 100 and 200 ft. from the main incline. Winze No. 1 is down 40 ft. and is in ore from top to bottom, assaying $200 per ton. Winze No. 2 is down 12 ft. and presents the same characteristics. It is intended to sink winzes at each 100 ft. of the third level.

MEADOW VALLEY.—The works at the several shafts are being urged forward and drifts are being run connecting the several shafts. The exploration of that portion contiguous to the Raymond & Ely continues to be gratifying and induces the belief that the rich body of ore struck in the Lightner shaft may probably extend into the Meadow Valley ground.

WASHINGTON AND CREOLE.—New hoisting works have just been completed. The incline is 500 ft. deep and is being well timbered; 4 or 5 tons of good ore are being raised daily.

PIOCHE PHŒNIX.—This Co. is sinking a vertical shaft with which it is expected to strike their vein in something over 400 ft. from the surface. Work on the incline is progressing and has reached a depth of 350 ft.

RAYMOND & ELY.—From 90 to 100 tons is being raised daily. The product of bullion is about $12,000 per day. A cross course is being cut from the shaft to the sixth or 523-foot level. It is in over 50 ft. and will take about 100 ft. in all to reach the level. About 300 men are employed in and about the mines.

ARKANSAS.—The incline is 310 ft. deep and the work of sinking is being rapidly pushed. Drifting is going on in the 120-ft. and 250-ft. levels, from which very fine ore is being taken—that from the 120-ft. level assaying $350. This drift is in 40 ft. and shows a vein 3¼ ft. wide. The lower level is in about 50 ft. and yielding fine ore.

MOUNTAIN VIEW.—An incline has been commenced and is down 10 ft. The vein is 2 ft. wide at the bottom of the incline and shows considerable metal.

AMADOR TUNNEL.—The tunnel is over 200 ft. in length. About half-way from the mouth some rich ore was struck, and a shaft is being sunk on the vein containing it. It is thought that the ledge, which is 2½ ft. wide, will average $250 per ton.

PIOCHE.—The work of sinking the incline has been temporarily stopped, a depth of 460 ft. having been attained.

BALTIC.—Work is going on vigorously. The incline has reached 80 ft. showing a ledge at the bottom of about 3 ft. in width. The vein carries considerable ore which assays about $125 per ton.

MEADOW VALLEY EAST EX.—The lowest workings are about 170 ft. from the surface. A straight shaft has been sunk 150 ft. from that point, a cross-cut run 35 feet from the further extremity of which an incline is being sunk and is 18 ft. in depth.

MARION.—The shaft is about 100 ft. in depth. The ledge is 5 ft. in width in which rich ore is found assaying as high as $300 per ton.

KENTUCKY.—The shaft is down about 360 ft. At the 330-ft. level a drift has been run, in which a connection has been made with the workings of the Raymond & Ely.

PACIFIC TUNNEL.—The tunnel is 1,000 ft. in length, and a contract has been let for another 100 ft.

PIOCHE WEST EX.—A large double shaft is being sunk on the claim and has attained a depth of 200 ft.

KENTUCKY RIFLEMAN.—Still sinking, with the ledge improving in size and character.

PAGE AND PANACA.—Sinking and drifting are going on, but without making any remarkable discoveries.

PIOCHE CHAMPION.—Work on this claim is progressing rapidly. No. 1 shaft is down 80 ft., showing a large ledge. A second shaft, for working purposes, has been started, which is down some 35 ft., and is intended to strike the vein at a depth of 370 ft.

CHIEF OF THE HILL.—The inclines is being sunk, and is 90 ft. deep, and is soon expected to cut the ledge.

SPRING MOUNT.—The shaft, which is a large double one, has reached a depth of 300 ft.

THE SPRING MOUNTAIN TUNNEL is in about 200 feet.

LILIAN HALL.—Drifting is going on about 70 ft. from the surface. Some good ore is being taken out.

INGOMAR.—The shaft is about 420 ft. deep. Contractors are at work sinking 100 ft. further.

KINSTON.—Work is for the present suspended. The shaft is about 250 ft. deep.

HUMBOLDT.

BULLION.—*Silver State*, Oct. 12: Amount shipped from the Arizona through W. F. & Co., since our last issue, was $6,408.

ARABIA.—Livelock and S. S. Grass have recently struck a big thing in Arabia, Trinity Dist. They have located a ledge, named the Virginia, which is 6 ft. thick and well defined. The ore is argentiferous galena, which assays from $38 to $58.50 per ton in silver.

MANITEE.—The Manitee Gold Run Dist. continues to produce rich ore. Several tons have been shipped, which have netted from $500 to $1,200 per ton. Another lot of 4½ tons has just been shipped, which assays $800 per ton.

SEMINOLE T. Co.—The Seminole Co. continues to prosecute work on their property. In the upper tunnel the ledge is 3 ft. thick and remarkably well defined.

ECLIPSE.—Work is about to be resumed on the Eclipse in the main range west of Unionville.

GEM.—At the bottom of the shaft, 175 ft. from the surface, the vein is 18 inches in width, carrying very fine ore, estimated to contain $2,000 per ton.

REESE RIVER.

BELMONT.—Reese River *Reveille*, Oct. 10: Monitor Co. is pushing its tunnel, No. 2, with 3 shifts of men; raising ore from the north incline; opening some breasts of fine ore down in the south workings.

The Monitor mill is fast approaching completion. This Co. is working 40 men.

BELMONT CO—Is opening the lower levels of the Canfield, also raising some fine ore from the upper levels, also running levels 200 ft. down the Highbridge.

EL DORADO CO.—The graders on the new mill site are blasting away in good earnest. In the El Dorado and Arizona mines work progresses steadily. The ore-houses and dump are filled to overflowing. The second level in the Arizona is being continued north. Over 10 tons of ore from the upper workings of the Arizona, worked in the Manhattan mill, yielded over $410.50 per ton.

IONE—STONEWALL.—The E. M. & M. Co. is driving a level south of the incline at a depth of 115 ft, and stoping in the old works above and taking out about 2 tons of first-class, or $150 ore per day. In the new level, ore assaying as high as $2,000 per ton has been cut through.

CROWN.—Mr. Beatie has gone below for the purpose of procuring an engine and other machinery for the completion of the hoisting works.

INDIANAPOLIS.—The Co. is only stoping in the 2d and 3d levels, and taking out from 2½ to 3 tons of $125 ore per day. Employs 10 men.

ELLSWORTH—ELLA FLORENCE.—The Co. is sinking the main incline—5 by 8 ft in size—and working 3 shifts. Present depth of incline 23 ft, with a vein 4½ ft wide at the bottom, and good ore.

ESTA BUENO.—This Co. is driving its third level at a depth of 210 ft. and stoping in the 2d level. Taking out about 2½ tons of $200 ore per day.

WASHOE.

SUMMARY.—Gold Hill *News*, Oct. 12: IMPERIAL-EMPIRE.—The work of opening the 1700-ft level is progressing well. The main drift is 77ft, making good headway. Last Monday morning the 3 o'clock shift of men working on the 1600ft level was shut down in the mine, and have been kept there for 5 days and nights, no communication from the outside being allowed. Rumor has it that a fine body of ore has been struck on that level.

VIRGINIA.—The progress of the main west drift on the 1167-ft level has been quite slow during the week. The main south drift and east and west cross-cuts on the 500 ft level are running through low grade ore. Sinking the shaft 500 ft deeper for a new level will be commenced in a few days. Work on the new hoisting works is progressing rapidly.

CALEDONIA.—All work on the 400-ft level of the new shaft has been stopped for the present. Work in the winze from the 400-ft level of the old works is being pushed with vigor to make connection with the 400-ft level of the new shaft. The prospecting drift south on the 300-ft level of the old works is still pushed steadily ahead, with promise of fine developments.

INSURANCE.—The whole face of the drift is in ore that promises a rich development.

BUCKEYE.—The 375-ft station is opened and a drift run through the ledge 5 ft, developing a fine body of excellent ore, some assays running as high as $65 per ton.

HALE & NORCROSS.—The exploration of the 1500-ft level is pushed forward without any valuable disclosures.

GOULD & CURRY.—The main drift of the 1500 ft level is in 64 ft, making good headway.

SILVER HILL.—Prospecting is carried on at the first level, with very favorable results. In the shaft encouraging indications have been met with.

SIERRA NEVADA.—Prospecting work on the 500-ft level progresses finely. The mill is crushing about 80 tons per day.

CHOLLAR-POTOSI.—Daily yield 160 tons worth $30 per ton. The different ore breasts are looking and yielding finely. The work of repairing the shaft is progressing slowly.

SAVAGE.—Good progress has been made opening the 1600-ft station, and a drift is started for the ledge. The ore developments on the 1500-ft level are more promising; while the body recently opened on the 500 ft level of the old works is yielding finely.

SENATOR.—Shaft down 180 ft with small feeders of quartz in the bottom. The sinking is making excellent progress.

WOODVILLE.—Daily yield 10 tons of high grade ore. Cleaned up $3,600 last Saturday from a run of 100 tons.

JULIA.—The shaft is down 920 ft in good sinking ground. The main east drift is in 200 ft., cutting during the week a fine body of ore, with excellent indications.

KNICKERBOCKER.—The main west drift is in 200 ft.

OVERMAN.—Work on the new machinery is fast approaching completion.

JACOB LITTLE.—Assays from the main ledge during the past week have averaged from $140 to $230 to the ton.

BELCHER.—Daily yield 250 tons. The ore bresats on the 1000 and 1100 ft levels are looking and yielding well. The drift south from the ore stope at the 1000 ft level is in 224 ft, with the face in barren quartz. The drift south from this incline on the same level, to meet the last mentioned drift, is in 149 ft, the face showing barren quartz and porphyry. The drift south at the 1200 ft level is in good ore.

YELLOW JACKET.—Daily yield, 20 tons. A cross-cut east is being made from the main drift north at the 1300 ft level, the indications in which are very favorable for finding ore.

CROWN POINT.—Daily yield 450 tons. The mine is looking well throughout.

KENTUCK.—Daily yield, 55 tons, from the old workings.

WHITE PINE.

REVIEW—BULLION.—White Pine *News* Oct. 5: The shipment from White Pine during the past week, was $11,486.43.

EBERHARDT & AURORA CO.'s MINES.—The Eberhardt and Blue Bell shafts are still sinking. In the Ridsdale and DePass chambers continue drifting from the bottom of the Ridsdale shaft to form a connection with the South Aurora tunnel. Working in the South chamber from the Lady's chamber in a body of high-grade ore, and shipping daily to the Big Smoky mill. The body of ore in this chamber continues improving in richness as developed. Have got good ore in the Central shaft at a depth of 100 ft.

BEECHER CONS.—Work in these mines is progressing as usual, and shipping daily about 28 tons to mill. There are about 700 tons of second class ore on dump.

TREASURE.—The ore in the shaft below the lower tunnel continues to hold out. Work on the Wheeler continues.

EAST SHEBOYGAN.—The drift from the Air shaft to the south drift for ventilating that part of the mine is being pushed ahead rapidly.

COPPER GLANCE.—Ore of good grade is being taken out of the north-west drift, which is being continued to form a connection with the north shaft, where there is good ore.

SILVER WAVE.—The ore in the Boswell works continues and shows some improvement.

OUTSIDE DISTS.—SCHELL CREEK.—Work on the Tehama Co.'s mill is progressing rapidly, and is expected to be completed by the 10th of next month. The mines are showing well and steadily improving in quality and quantity of ore.

WARM DIST.—Considerable work has been done on several of the mines, showing assays from $40 to $400 in silver.

WESTERN SLOPE WHITE PINE MOUNTAINS.—TRENCH.—The north drift is showing good ore and the mine is looking well.

MILLS.—BIG SMOKY.—Running on ore from the Eberhardt & Aurora Co.'s mines.

MANHATTAN.—Running steadily on ore from the Beecher Cons. Co.'s mines.

TAILINGS MILL.—This mill below Shermantown, started up this week on tailings.

MCMAHON.—Schell Creek *Prospect*, Oct. 5: Working three shifts in the shaft and 2 in the tunnel. The shaft is down 70 ft. below the croppings. The tunnel is in 57 ft., showing vein matter and suggesting the probability of a parallel vein. In our opinion the permanence of the vein is established with very encouraging prospects of a valuable mine. There is a large quantity of ore on dump, and we are informed that the Co. will have a ten-stamp mill erected before winter sets in.

JUPITER.—Work being prosecuted with vigor in shaft and tunnel. The shaft is down 35 ft. in fine looking quartz; the tunnel is in 45 ft., showing ore of average quality.

KAVANAGH TUNNEL.—During the week quartz of good quality was struck at a distance of 85 ft.; the owners expect to strike the main ledge of the hill when in about 100 ft. further.

WOODRUFF.—Will start up shortly.

TEHAMA.—Work progressing every day; tunnel in 315 ft.; for the last 15 ft. have been working in quartz; ore is being taken out of the cuts on the War Eagle, Allen No. 2 and other parts of the hill.

SCHELL CREEK.—Tunnel in about 215 ft.; shows some quartz in the face; working on croppings and extracting some good ore; 3 shifts working.

ALBERT.—Tunnel in about 40 ft.; taking out some very fine ore, and working a large force of men.

QUEEN SPRINGS.—LA BROSS TUNNEL.—Work is being pushed day and night; the tunnel is in 180 ft. The Co. intend running it 420 ft. further, when they expect to strike the main ledge of the hill at 300 ft. from the surface.

DISCOVERY.—Ore of fine quality was struck last week about six miles north of Egan Canon.

Arizona.

MINES AND MINING.—YAVAPAI CO.—Prescott *Miner*, Sept. 28: Jesse Jackson & Co., on the Del Pasco section of Bradshaw Mts., struck richer rock than they have yet worked. The mill is running.

Capitalists in S. F. and the East, who part own mines at Black Cañon, talk seriously of starting work upon them.

Placer mining—with paying results—is being prosecuted on Lynx Creek and the Hassaysmpa.

At Weaver the rock worked by the Marcus Co. during the past six weeks has averaged over $100 per ton.

Colorado.

CLEAR CREEK CO.—Central *Herald*, Oct. 2: Drifting progresses on the last lode cut by the Marshall tunnel, 1,200 ft. from the month of the latter, displaying a large, strong vein of ore containing much brittle silver. The Marshall Tunnel Lode No. 5, is producing very rich ore, and the Compass and Squars is also yielding good paying ore.

Glass and Gaskell are obtaining large quantities of immensely rich ore from the Saco.

E. Y. Naylor is driving the Hiswatha and Wild Wagoner tunnels, near Mill City. The former is in 500 ft. On the mountain above, some very rich looking gold ore has been struck on the Root Hog. The tunnel driven along the Wild Wagoner is 405 ft. long, developing an abundance of low grade ore. The width between walls on this lode is 50 ft.

Mr. Wann is rapidly reconstructing the Whale mill for smelting purposes.

IRON.—Colorado Springs, *Out West*, Sept. 16: A new discovery of ore has been made. The deposit is in Wet Mountain Valley, and the ore is claimed to be equal in quantity and superior in quality, to that of Grape Creek.

During the past 10 days the Caribou mill, Middle Boulder, has shipped $20,000 worth of silver to New York.

Idaho.

BULLION.—Owyhee *Avalanche*, Oct. 5: W., F. & Co. shipped from here during the week ending yesterday, 5 bars, valued at $8,548.46.

SOUTH MT.—Mr. Dewey starts up the Independent to-day. This mine has a shaft to the depth of 60 ft., and Supt. Conway will immediately start a level.

ROCKY BAR.—Idaho *Statesman*, Oct. 8: S. Mattingly is crushing very rich ore from the "Lenora" and "Stanley" mines. H. T. Lantis has just got through crushing some 11 tons of Atlanta ore, which paid as high as $1,000 to the ton.

John McNally, on Red Worrior, has struck a very rich solid vein of pure quartz, in the lower level of the "Wide West" and 2 ft. wide at a depth of 210 ft. from the surface, which will pay not less than $150 a ton. Kessler & Dardis are sinking a shaft on the ledge to the depth of 50 ft.

Utah.

LITTLE COTTONWOOD.—S. L. *Tribune*. Oct. 8: On the Grizzly the main shaft is down about 75 ft.

On the North Star work was resumed a few days ago, and will be carried on during the fall and winter.

On the Amador a shaft has been sunk 50 ft., passing through a mineral formation the whole distance run.

The smelters have shut down in East Cañon, but the Pioneer Quartz Mill, New Jersery Milling and Furnace Co. and the different arastras are all in full blast.

ROCKY DIST.—Among those appearing the most favorable at present are the Rockyfellow. The vein, is a large, well-defined fissure of over 6 ft. A shaft has been sunk upon the lead, a distance of 50 ft. or more, showing a uniform width of a fine quality of copper ore. The percentage of copper, from an average of the 100 tons on dump, has yielded over 28 per cent. in copper and $40 in silver to the ton of 2,000 lbs.

Hammond & Co. are vigorously pushing work upon the Champion. A shaft is down on the vein over 70 ft., the ore and fissure looking well.

Homeward Bound, to the depth of 20 ft., the present depth of the shaft, the vein maintains a uniform width of about 6 ft. with a heavy clay gouge on each wall. The ore assays 20 per cent. copper and $40 in silver.

The Belcher shows a vein of about five ft., a shaft has been sunk upon it 23 ft. the ore assaying as high as 30 per cent. copper, $50 silver, to the ton.

STAR.—Unionville (Nev.) *Silver State*, Oct. 5: The De Soto continues to look well and produce rich ores. The Sheba is improving. The ledge is larger and better defined than heretofore. The Trinity ledge is yielding rich ore. A large force of men are at work on the KNOW Concentrator building.

Apparatus for the Firing of Mines by Electricity.

The colliery of Crachet at Frsmeries, Belginm, has recently begun to apply practically elsctricity to ths firing of mines in underground works. The experiments have been followed dnring sevsral months, and have proved undoubtedly, and by ths bsst results, the high value of this improvement at ths point of visw both of economy and ssourity.

Ths author of the nots, Mr. F. Guchez, Mining Engineer, was present at all the experiments mads during ths sinking of a shaft. Ons of ths principal advantagss of ths process consists in ths faculty to firs several mines togetber, the result being, especisily in shaft-sinking, a great economy of tims, and somstimes an increase of usefnl effect from ths simultaneity of the explosions.

The electric wick is formed hy two iron wires placed in a thin board of wocd. the length of which is a little greater than the depth of ths mine-hole. Thess wires, at the end of ths hoard, meet into a small shset iron case containing a fulminating substance which is put in the middle of the powder of the cartridge. The spark is discharged hetween the extremities of the wires about one-twentieth of an inch apart, and determines the explosion. Ths filling and the ramming of the mins don't require any partienlar precantion. The wires pertaining to the electric wicks of the different mines are connected at their upper ends with other wires having the same diameter, and establishing a galvanic circuit hetween those wicks. The extremitiee of tbis circnit connect, in their turn, with two stronger copper wiree, in communication with the electric source. The two principal wires are isolated hy a donble covering of tarred wool and gutta percha, and bonnd together by a general covering of twisted wool, in order to form a eingle rope. This rope is fifty metere long, one end hanging in the shaft at about two meters above the hottom, and can be lengthened when the ehaft becomee deeper. The preparations for the firing of three or four minee are made very rapidly. When they are ended, and all the men raised up or eheltered under proper cover, the electric machine is worked, and all the mines explode together.

Up to tbis dav, more than 4,000 mines have been fired at tbe Crachet colliery, and only twenty bave missed on account of small imperfections, which bsve been since corrected. The machine is enclosed in a wood case, etrong, easy to carry, and waterproof. It produces static electricity by the rubbing of a gutta percha cylinder against a catskin, and accumulates in a kind of bottle like a Leyden jar; an excitator provokes the discbarge. It is worked with a crank. According to the devolopment of the conducting wires, the degree of perfection with which they are isolated, and the keeping in order of the machine, two to eight revolutions of the crank are required. The machine is very simple, and consequently not very liable to get out of order. It ie sufficient to clean the catskin from time to time, which becomes dirty by use, and dry the piecee which would have been chsrged with moisture. Its cost is only 100 francs ($20 gold), the wires not included: the price of the wicks ie about two cente apiece, and as for the rope witb double wire, extending from the orifice to the bottom of the shaft, its price is about twenty-five cents a meter.

This mode of firing comes from Germany: its nse is likely to be extended to all mines and qusrriee. Simple and cheap, it affords at the eame time economy of time and consequently expense, and offere the great advantage to render impossible the numerous accidente occurring by the ordinary method of firing mines. At this last point of view, it deserves all the attention of mine owners interested in the eecurity of their workmen.—*Coal and Iron Record.*

Rediscovery of an Ancient Mine.—The Montezuma mine, in the Ivanpah region, in this county, is a mystery. It was discovered a few months ago by Mr. Mat. Palen and another gentlemau. who are now its owners. It is auriferous, and bears nnmietakable evidence of having been extensively wrought in bygone times. The vein is of eight feet thicknees, and from the surface downwards for more than fifty feet has heea displsced, and the ore removed. The few pieces of quartz left clinging to the side wall of the aperture give evidence of exceedingly rich ore. Near, or in the mine, not the elightest trace of machinery, toole, furnaces, or any other signs have been found that would indicate the chronology of the work or race of meu that did it. Nothing survives of these former miaers except the open, gaping crevice from which the quartz was excavated. The hottom of the crevice hae not been found at a depth of fifty-three feet, owing to the great amount of rubbish which in the course of centuries, has fallen into it from the walls and surface. Could a single mining implement left hy ite ancient owners he unearthed, the mystery ae to who they were wonld be cleared up. After ineffectual attempts to find the bottom of the crevice, Mr. Palen and partner, thoroughly convinced of the exceseive richness of the ore, have commenced tunnelliug, eo as to etrike the veia two hundred feet or so below the apex of the ridge from which it cropped. From the examiaation made there ie the assnrance that in a shorttime will he developed the richest auriferous "find" on the Pacific coast.—*San Bernardino Guardian.*

Eccentricities of Stratified Limestone Formations.

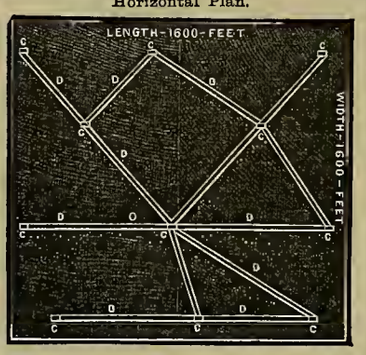
The following letter appears in the London *Mining Journal* of a rscent dats. We have given ths previous lsters of Mr. Sewell on this subjsct in former numbers of the Press, and this is a continnation of them:

In my former letter I described the two fissure veins in the district of Chanarcillo, in Chili, and the length and depth to which they had been worked, I omitted then to state that no quartz matrix or silica was ever found in thess veins, ths principal gangne consisting of crystallized lime-spar, oxides of iron, and alumina. In Jauli, in Peru, I inspected mines in this formstion at a hight of 15,500 feet above the level of ths sea; the fissure veins here carried rich galenas, containing throughout ruby silver ore. These are calcined and smelted in a species of reverberatory furnacs, and the fuel employed is sheep and llama dung, which is collected and dried during the summer months. I resided in these exalted regions, in 1857, for about eleven months, in the management of soms silver mines and reduction works. The latter wers situated at 16,500 ft., the former at 17,600 ft. above sea level. The works consisted of several arsstras for grinding the ores, and the amalgamation was performed in

Sectional Plan—With denudation up to point B.

Treea growing on the silver stratum. A to B, boundaries of the mine. The perpendicular lines denote the ledge, or quartz stratum, as I have named it. The horizontal lines the limestones.

Horizontal Plan.



C, C, C, C, shafts 8 feet deep sunk into the a ratum; D, D, D, D, surface ditches on the stratum, communicating one shaft with the other, and were made to prove the amount of ore contained in sight.

barrels. In the chlorination of the ores I was forced, at first, to use the fuel above mentioned for several months, nntil I diecovered some coal mines a few miles from the works. The limestonee of Mexico I need hardly describe, for they are similar to those of Chili.

Those of Spain are similar to those found in Utah and Nevada, producing similar classes of ore, carbonatee of lead rich in silver, and mostly strata veins. In the vicinity of the Almaden minee I found them to consist mostly of contact veins. having the limestone as a hanging wall, and sandstone as the foot wall. In Utah I have found tbat most of the veins in limestone are strata veins, such as the Emma, Flagstaff, and other mines. The Reid and Benson Mine in Big Cottonwood, in the Wahsatch range, is composed of a fissure vein, cutting the strata, and joined at a depth of 60 feet from surface hy two strata veins, where the large chamber of ore was discovered. The oree of this miae resemble those of the Emma Mine, consieting of decompoeed galenas or carbonates and antimonial silver oree. In the Oquirrih range, which is parallel to the Wahsatch, aud distant about 25 miles, we have two different limeetones—one almost pure, and the other highly charged with silica.

Lion Hill, in East Cañon, distant about fonr miles from Camp Floyd mining district, hae mostly fiseure veins: the bed rock consists of feldspathic porphyry, which bursts through the limestone in eeveral points. In one of these miaee, at a depth of seventy feet from the surface, the bonee of several small animals were found, of the hadger tribe, forming a regular conglomerate with the ore. I have given theee to Professor Leidy, the celebrated palæontologist, to determine for me. Thie is not the first time I have found petrifactiona in fissure veins in the limestonee. In 1852, I forwarded to Professor Cotta, of Frieberg, two petrified shells I found in a vein in Chili, and surrounded by horn-silver. The existence of these bones in the fissure is easily explained. These fissuree are of recent formation, and were not filled up altogether with mineral matter, for in some placee on this hill, ia driving and sinking, hollow spacee have been found in the fissures, from sixty to one hundred feet in length; theee, no doubt, had communication with the eurface, and were undoubtedly the abode of these animale. The importance of the discovery consists in the bonee having been found imbedded in the ore, *proving* that after the death of thess animals ths infiltrations and solutions of ore still continued. I will hereaftsr forward you a description, by Profsssor Lsidy, of this singular occurrence.

Now I come to the limestones on the foothills of East Cañon. On these are sitnated the Rip Van Winkle, Green Chloride mines and several others, which have been under my superintendence from ths time of their discovery. The Green Chloride, however, is the most remarkable of ths whols gronp, and a "rara avis in terris nigroque simillima cygno." This is a quartz stratum, from six to eight fest in thickness, and the angls of declination is from five to ten degrees, and perfectly denuded of all cap work; the underlying rock on which this quartz stratum rests is an argillaceous limestone. Ths workings of this mine havs had to hs carried out in quits a novel fashion, as the accompanying illustrations will explain.

[Since this letsr was published in the *Journal*, Mr. Sewell informs ua that he has commenced an incline shaft on ths quartz stratum, but under ths cap of limestone shalee at point marked *X X*, and has struck very rich horn silver ore. Ens.] The ore is all fres milling or horn silver; 10 tons were recently sent to ths Reno mill for reduction, and averaged $451 per ton. Thers is ahout 500 tons on the dumps that will averags about $80, and about 30.000 tons discovered that will average about $50. This may rightly he named quarrying for silver ors. Two tons taken from one spot produced $2,000 per ton. In Belmont, Nsvada, I inspected last year ths El Dorado Sonth, Monitor and Arizona minss. In these the hangiag wall is limestone, and the foot-wall feldspathic porphyry, and, consequently, a contact ledge. The ores are chiefly horn-eilver, near the snrface, and change into antimonial silver ores, with a little copper generally called stetefeldite. These minee are destined to become celehrated, and are prodncing large quantities of bullion. On my return from the Mineral Hill minee I will forward you informaation as to these limestone formatione.

Henry Sewell.

Salt Lake City, U. T.

Utah Railroads.

One noticeable feature in the wonderful progress being made in our Territory is the increase in the railroads which will soon reach every prominent dietrict in the country. The Utah Southern, on the broad gauge principle has been extended as far as Lebi, where it will stop this season but will eventually be extended as far as the Colorado river, and possibly to the Southern Pacific in Arizona.

The American Fork narrow guage will be completed in a few days from Lehi, its janction with the Utah Southern, to Deer Creek, American Fork Caõon, nearly twenty milee in length. This will be pushed to the Sultana worke before the season closes.

A third enterprise, which will soon be under way aud completed probably hefore snow flies, will he the Bingham Caõon narrow gange road, about seventeen miles in length.

The last road, already being built, will run from Echo through Parley's Park and along the Provo River to Provo, connecting with the Utah Sonthern.

Other roads are projected, but these are all that are fairly under way. Utah ie surely looking up.—*Utah Mining Journal.*

El Dorano South Consolidated.—The Reese River *Reveille* of October 5th saye of the El Dorado South Consolidated Mining Company that the busiest spot in Nye county seems to be on El Dorado Hill. The graders on the new mill site are blaeting away in good earnest. The grading is all in blasting rock. The pan room is nearly completed. Carpenters, masone and blackemithe can be seen in every direction. Another installment of machinery has jnst arrived, and if no eerious delay occure the etamps will be playing on the rich El Dorado oree before the enow fliee. In the El Dorado and Arizona mines work progresses steadily. The ore houses and dump are filled to overflowing. The second level in the Arizona ie etill beiug continued north, and carries with it the eame rich vein of chloridee that has made the Arizona and Monitor minee eo famoue. Over ten tone of ore, taken from the upper workings of the Arizona, and worked in the Mahattan mill of Anstin on the 10th ult., yielded over $410.60 per ton.

Steam Plowing in Cuba.—A sugar planter in Cuba writee that in Novemher, 1868, he commenced work with one of the Fowler steam-plowe, (running with two enginee of fourteen-horse power each,) and since then has broken up 2,000 acres of strong clay land intermixed with stones of all sizee, and reeting for the most part on a etone bottom, plowing to an average depth of eighteen inches. The plow having been managed by an experienced hand, the breakagee have been few and of a trivial character, and the wire rope is still in excellent condition. The lands of the estate have been doubled in value by steam-plowing, and what wae formerly almost an impervious marsh, the effect partly of nature and partly of inefficient cultivation, hae been reduced to a porons soil.

A chill-roll was cast at the foundry of A. Garrison & Co., in Birmingham, Penn., its dimensions being two feet eeven inchee in diameter, and eight feet long on the working face, weighing 29,000 lbs., or 13 tons—said to be the largest chill-roll in the world.

Lida Valley Mines.

A correspondent of the Reess River *Reveille* writes as follows from Lida Valley:

From about the middle of July until within the last ten days very little was done in either developing mines or taking out ore. Despondency superinduced by disappointments had seized upon, and to an extent paralyzed the energies of the miners and mine owners; not that confidence in the mines was wanting, or the ultimats success of the district doubted. The latter is assured hsyond a doubt, and in proof we submit the figures, lsss the fractions, taken from certificates of pnlp assays of ten different ledges, the ore having been worked at the Deep Springs mill, and challenge any mining district in the State to equal the product per ton from the same number of ledges:

Names.	per ton.
Simon Pure	$1,303 00
Sewana	1,171 00
Mountain View	1,016 00
Bennett	1,012 00
Oro Fino	895 00
Lida Bella	724 00
Frenchman	425 00
Martin & Henry	386 00
Monitor	330 00
Rappahannock	265 00

Brown's Hope, owned by the Deep Springs Mill Company, has prodnced ore that worked much higher than any of the ledges named.

Now that the district has been vieited and the minee examined by a practicable, competent and reliable mill man, whose opinion was, when he left on the 9th inst. so far as we know, locked up in his own breast; but snch is the confidence we have in the mines, that to have them examined, together with the facilitiee for reducing the oree, ie the precursor of the speedy erection of reduction works, hence the new impetue given, not only to the miniug interests but to every branch of business. It requires no prophetic pen to see Lida Valley district in the list of first-class bullion producing districte in Nevada.

In Gold Mountain district, 20 miles north of Lida Valley, there are many fine ledges—about 100 locations on record—the developments made on eome 35 ledgee aggregate from 10 to 75 feet in depth. In many of the lodes gold predominates. Though this district is much the senior of Lida Valley, very little developments have been made, save on the State Line ledge until, since the organization of Lida Valley. Bordering on the undisputed domain of the "Noble Red Man," its attractions have not hitherto been appreciated.

There are at present about 20 miners in the district—all buoyant with confidence of soon realiziag handeome compensation for their labor.

Mountain View Consolidated S. M. Co.—The mines belonging to this company are sitnated on Prospect Mountain, Eureka, Nevada. This consolidation bas four firet-class locations, viz.: the Mountain View, Anna, Mazeppa and Lightning-Bug, each having 800 feet in the location. The works of this consolidation cover an area of 100 feet, as the mines are all together and join one another, makiag it one of the most valuahle locations on the hill. The Mountain View has a shaft down about 80 feet, and about 25 feet down they have run a drift 30 feet, taking out rich eulphuret ore. The ledge variea from 18 inches to five feet in width. On the Anna mine they are down about 35 feet, running directly towarde the Mountain View with a ledge about three feet wide and fine rich ore. The Mazeppa has sn incline of about 30 feet, with well-defined walls with a fine showing ledge from 14 inchee to 2½ ft. in width.

The Lightning-Bug hae two shafte. One down abont 12 feet, with an incline running from ehaft of 30 feet, the other shaft about 15 feet, both shafte and the incline showing the richest kind of ore, with pay-ledgee from 21 inches to 40 inches in width. The poorest ore-assays go $180.

Business at Eureka Mills.—The new sawmill of the Eureka Mills Mining Company is in operation, and turne out daily about 25,000 feet of lumber. For the new flume and quartz mill the Company are building 1,200,000 feet of lumber will be required. The new mill is beiag bnilt on the eonth side of the mountain, two miles from the old mill. The ore will be brought to the mill from the mine through the old Mammoth Drain Tunnel, which is 1,400 feet in length. Thie tunnel ie seven feet wide and seven feet high in the clear. The new mill now being erected, it is expected, will be completed this fall, and will have forty etamps. The entire cost of all the improvemente now being made by thie Company in their mine, flume, huildinge, etc., will aggregate $250,000. The ehipment of hullion from the mine for the month of September was $25,000. The Company have now in their employ 326 men, of whom 95 are Chinamen.—*Truckee Republican.*

Mitchell County, Kansas, according to a correspondent of the Waterville *Telegraph*, pans out a petrified sea animal fifteen feet long, and another that measured twenty-two inches between the eyes, the body of which is about three feet in diameter, and to show that that field was appreciated long ago, a field hoe has been fonnd forty feet below the surface, imbedded in solid rock.

Useful Information.

Oyster Babies.

An observer of the oyster says hs is not as stupid as he looks. He can keep his mouth shnt, and thoreby defy all our arts to wils a secret from him. Whon spatting time with the oyster comes, it is said to be sick or milky. This appearancs is due to ths accumulation of ths spat, which is, in tho carlier stages of its dsvelopmcnt, of a creamy consistence of color. Whcu the spat is matnre, it assnmes the spparance of the scraping of a slate-peacil; the parent oyster then opens ita shell, and a kind of mistiness is obscrvablo in the surrounding water.

This is cansed by the myriads of younq oysters scattered in every directiou. No sooner are these tiuy creatures free from thsir mother than they assumo the most active state of life aud motion, dancing and gyrating np and down in concentric columns, aa midgeta play in ths evening sunbeams. Under ths lons of a microscopo yon will sse how exquisitely thess littlo fellows are fashioned.

A pair of tiny shells, the connterpart of thoss of the mature oyster, encloss the yet rudimsntary organs, while affixed to the mantle is a kind of tiuy coronst, compossd of minute, hair-liks appendages (cilia). Ths violent and ceaseless vibration of thess living paddlss serves to row the infant oyster rapidly from the place.

Shonld it bscomo the dsstiny of ons of thsse frsgile beings to become a steady, well-behaved oyster, it finally settles itself on soms suitable rssting-place, to which it makss itssIf fast—no ono ever clearly knows how—by the nnder valvs or shell. . Ths hristls-like oars of cilia, no longer of any ntility, disappear, and now a permauent fixture, the baby oyster hegins to grow.

At about a fortnight old it is not mnch bigthan a fair-sized pin's head, and at three months ahout that of a split pea. Having attainsd a ysar's growth under favorabls conditions, the young oystsr will become as big as an ordinary halfpenny; whils at four years' growth they are considered marketabls.

Antiquity of Fermented Liquids.

It is highly creditahle to the ingennity of our ancestors, that ths pecnliar property of fermented liquids, in virtus of which they "make glad the hesrt of man," sesms to havs heen known in ths remotest periods of which we havs any record. all savages take to alcoholic fluids as if they were to the manor born. Onr Vedict forefathers intoxicatsd themssl ves with the jnice of ths "soma;" Noah, by a not nnnatural reaction against a supsrfluity of water, appears to have taken ths sarliest practicahls opportnnity of qualifying that which he was ohliged to drink; and the ghosts of the ancient Egyptians were solaced hy picturss of hanquet in which the wine-cnp passes round, gravsn on the walls of thsir tombs. A knowledgs of ths process of fsrmentation thersfors, was in all probability possessed by the prehistoric population of ths globs; and it must have bscoms a mattsr of grsat interest even to ths primæval winshibbers tostudy ths methods by which fermentsd liquids conld bs sursly manufactnred. No donbt, therefors, it was soon discovsred that the most csrtain, as well as the most sxpsditions, way of msking a sweet juice fermsnt was to add to it a littls of ths scnm, or lses, of anothsr fermenting juice. And it can hardly he questioned that this singular excitation of fsrmentation in one fiuid, by a sort of infection, or inoculation, of a littls fsrmsnt taken from soms other fiuid, together with the strange swelling, foaming, and hissing of the fermentsd snbstancs, must have always attracted attsntion from ths mors thonghtful. Neverthelsss, the commencement of ths scientific analysis of ths phenomena dates from a period not earlisr than ths first hslf of ths sevsnteenth century.—*Popular Science Monthly.*

Hydroscopy—What Is It?—A Frsnchman by tns name of Paramslle has besn devoting himsslf to ths scientific study of subterransan watsrs, ths kind of ground where they ars to bs found, their flowing, ths physical laws that govern their abundancs or scarcity, and their depth. Ths sciencs is now ssid to hs complste, and it has bsen christened "hydroscopy," or subtsrranean hydrology. Its applications are definite, and amoug them we must place in the first rank ths discovsry of springs and well sitss. Within easy accsss of every villags, almost of every houss, and generally at a little depth below tbe surface of the aoil there exista streama of water. By a simple digging (indicated aftsr a thorough survey of the plncs, and not by the aid of the divining rods, which have made so many dupes), one can channel out the hidden streams, and make them flow to the surface; or else a well can bs dug which will fnrnish an abundant anpply of water. Paramelle has already, it ia stated, discovered 9,500 springa in Francs, and hia disciplss have bssn squally successful.

Do Fishes Think?

It is a novsl qnsstion, bat not beneath ths consideration of a philosopher. It is a common way of dispoaing of difficnlt problems in regard to manifestations of intelligence in animals which ars departnres from the ordinary rontine of their acts, to call them extraordinary deviations from their natnral instincts.

Ths monkey that smoked at ths Zoological Gardens last acason for ths pleasure of it, and dogs which ars met on Broadway carrying home a hasket of provisions, threading their way through crowds of husy humanity, all perform acts ahovs the law of simple instinct, which makes no progress, hnt repeats ths same thing in each snceeeding generstion.

The first associated a sensation of pleasnrs from charging a pips with tobacco, and ths latter has in mind ths approbation of their masters in faithfully delivering the marketing to ths cook.

If there is no reasoning here, what is it? And next, how ars snch mental pheuomsna to bo explained?

Fishes havs a pecnliarly nice sense of smell, and their ears are curiously constrncted with reference to appreciating the slightest concussions at a very conaiderable distancs. When waves dash against rocks or a belligsrsnt contest is raging betwsen aquatic enemies, thsy appear to havs exact knowledgs of what is transpiring, throngh their delicate acoustic organs.

Fishes also receivs impnlsss from ths air, sv●n slight as may he ths force of aerial nndulations on ths dsnssr mediums on which they float. It is positively certain they may bs tanght to gather for fseding at the ring of a bsll. That is a dsmonstration.

If, whsn thsy hear ths hell they rush to ths spot whers the food is given thsm, it is an indication of memory? A particnlar sound is associated with ths idsa of satisfying hnngsr; can thers hs msmory without reflecting?

What property of mind is it hy which they ars instructed, so that by repstition a csrtain amonnt of actual knowlsdgs is aoquirsd, in that thsy do not think?

The Human Ear.

Profsssor Tyndall oonclnded ons of his rscsnt lecturss by giving a minuts description of the hnman ear. Hs sxplained how the sxternal orifics of the sar is clossd at ths hottom hy a circular tympanio memhrane, bshind which is a cavity known as ths drnm; ths drum is separated from ths brain hy two orificss, ths one ronnd, the other oval. Thess orifices are closed by fine msmbranes. Across the cavity of ths drum stretches a seriss of four littls bones, one of which acts as a hammer and anothsr as an anvil. Behind ths bony partition, which is pierced by the two orifices already msntionsd, is the extraordinary organ called the lahyrinth, filled with watsr; this organ is betwsen the partition and the brain, and over its lining msmhrane the terminal fibsrs of ths auditory nsrvs are distribnted. Thsre is an apparatns insids ths labyrinth admirahly adapted to respond to thsse vibrations ot the water, which correspond to the rates of vibration of certain "hristles," of which ths said apparatus consists. Finally, thsrs is in ths labyrinth a wonderful organ, discovsred by the Marchese Corti, which is to all appsarancs, a musical instrument, with its cords so stretched as to accept vibrations of diffsrsant psriods, and transmit them to nervs filaments which traverse the organ. Within ths ears of men, and without their knowledgs or contrivancs, this luts of thrss thousand strings haa existed for agss, accepting ths music of the outsr world and rsndsring it fit for rsception by the hrain. Each mnsicsl trsmor which falls upon this organ sslects from its tensioned fibsrs the one appropriats to its own pitch, and throws the fiber into unisonant vibration. And thns, no matter how complicated ths motion of ths extsrnal air may bs, thsse microscopic strings can analyze it and reveal the constituents of which it is compossd; at lsast such are the prssant views of thoss authorities who best understand the apparatus which transmits sonorous vibrations to the anditory nervs.—*London Paper.*

"What is a Hogget?"—It is an English term applied to sheep, and, like many other similar tsrms, does not ssem to havs any very definite meaning. Wsbster, quoting from ths American agricnltnral writer Skinner, says, "A hoggst is a shsep two ysars old." As we nndsrstand ths matter, howsver, the general mesning of the tsrm as used by English farmers is a sheep, mals or fsmale, from ths time it ceases to be a lamb until it is shorn for ths first time. After it is shorn, it is a "shearing" or "shsarling;" when shorn the second time, it is a "twoshear" sheep, and when shorn tbe third tims, a "thrss-shear" ram, ews, or wethsr, as ths case may bs. A "hoggst," then, ia a lamb, without regard to aex, from five to fifteen months old, or nntil it ia sheared. After that, it censea to be a hogget and becomea a shearling. For the sake of distinction it is, ws believe, proper to say sws hogget, wether hoggst, etc.

Soldering Lead.—Plnmbers' solder is an alloy of 1 part lead and ¾ part tin; apply with an ordinary soldering iron, ths joint having been first scraped clean and rnbbed with tallow or rssin.

Good Health.

The Influence of School-Life on Sight.

Dr. Lisbreich, opthalmie snrgeon and lecturer at St. Thomas's Hospital, London, has hcen making investigations on this snbject in English schools, and finds almost everywhsrs arrangmsnts mors or lsss injurions to the organ of sight. An articls in the *American Artisan* gives an abstract of Dr. Liebreich's remarks, from which ws select ths following:

The changes in ths fnnctions of the visual organ developed under ths influencs of schoollifs are thres in numher:

1. Dscrease of the range of vision.
2. Decrease of the acntencss of vision.
3. Decrease of ths endnrance of vision.

Decrease of the range of vision, or shortsightedness, is dsveloped almost exclusively dnring school-life. It is true that short-sightedness is often hereditary, bnt this must not he thought to mean that the children of short-sighted parsnts are horn with this defect. They have only the predisposition to become short-sighted, and this predisposition is developed during school-lifs, more or lsss, according to circumstancss.

Decreass of acutensss of vision is generally the rssult of positivs dissases of ths eye, which may exceptionslly hs induced at school. This dsfect is, howsver, often produced in one eye by unsuitahle arrangments for work, which disturh the common action of the two syss, and wsaksns ths eys which is sxcluded from uss.

Decreass of sndurancs is a vsry frequsnt affection, and arises principally from two causes. The first is a congsnital condition called *hypermetrophia*, which can hs corrected hy convsx glassss, and which can not thsrefore bs laid at ths door of school-lifs. Ths second is a disturhance in the harmonions action of the muscls of tbs eye—a dsfect which is difcult to cure, and which is generally caussd hy nnsnitable arrangements for work.

Thess thrss anomalies all ariss from ths same circumstances, viz.: insufficient or ill-arranged light, or a wrong positiou during work.

Insufficient or ill-arranged light obliges ns to lessen the distance hetwesn the eye and the book while reading or writing. Ws must do ths same if the desks or seats ars not in the right position or of ths right shaps and sizs. When the eye looks at a very near object, the accommodating apparatns and ths mnscls which turn tho sys, so that ths axes convsrge toward the same object, are hrought into a condition of a greater tsnsion; and this is the principls cause of short-sightednsss and its increass. If the mnscles of the eys ars not strong enough to rssist such tension for any length of time, one of ths eyes is left to itssIf; and while one is directed to the objsct, ths other deviates ontwardly, receives false imagss, and its vision hecomes indistinct. Or, perhaps, ths mnscles resist these difficulties for a time, bscoms weary, and thns is producsd the diminntion of endnrancs.

In ordsr to prevsnt these svils, ths light shonld he snfficisntly strong, and fall on the tabls from the left-hand side; and, as far as possible, from above. The students should sit straight, and not havs ths book nearsr to the sye than ten inches at the least. Bssidss this, the book shonld he raised 20° for writing and ahout 40° for reading. The proper light ie most easily ohtained if ths class-room is of an oblong shaps; ths windows bsing in one of ths long sides, and the desks arranged parallel to the short walls, so that ths light falls from ths lsft side. The dssk of ths master should bs placed nsar the short wall toward which the scholars look.

Tea, Coffee, Cocoa, and Alcohol.

Ws extract from the *British Medical Journal* ths conclnsions of a French physician, Dr. Angel Marvand, who has heen experimenting on the physiological and thsrapsutical effects of coffes, tea, cocoa, maté or guarana (Paraguay tea), and alcohol, which he classes together as aliments of economy, or anti-wasts foods. He considsrs their influence on nntrition from two points of visw as stimnlants to ths nervons system, as anti-waste foods or anti-assimilators. Alcohol acts directly on ths sensory apparatns of the spinal cord, and indirectly on the motor apparatns. Cocoa acts directly on ths motor apparatus, which it excites in the same mannsr as strychnins. Coffee, tea and maté act principally on the brain. Alcohol and cocoa excits ths exerciss of the muscles; coffee, tea, and maté, the exsrciss of thougbt. Further, by lessening ths wasts of ths tissnes, connteracting organic oxidation, and diminishing loss by means of ths secretions, they all act as alimsnts of sconomy. In this way is explained their action in stimulating to work in ths evening, in partly supplying the want of solid food, and in modsrating vital comhnstion. Hence arisea their incrsaaing consumption, and their mors general uae aa articles of daily régims; hence, too, their ntility in alimentation, and their important place in hygiene. The abuse of theas ailments has, it ia true, two principal inconveniences. In the first place, ths excitement of ths nervons aystem which they cause ia liahle to bs followed by fatigue, weakneaa, and even inertia. In the sscond place, hy their inteference with and reduction of the processea—indiapensably necessary to life—of combination, transmntation, and decomposition, thsy may canss arrsst, snspension, or even complets suppression of the nutritive changes in the cellular elements, and may produce as results, torpor, atony, fatty degeneration, and necrobiosis of the tissues. Thus ars explained alcoholism, coffeeism, thsinism, and cocoaism.

Mental Vigor in Old Age.

Of a cslebrated writer, whose age is sixty-seven, it is said: "He now lives in retirement, having given up all labors, literary and otherwiss." How often is this record made of men whose powers ars unimpaired and whoss lahors, if continnsd, might hless ths world to the end of time.

It is ssid of Arnanld, the Janseniet, that hs wished his friend Nicole to assist him in a new work. Nicols replied: "We are now old; is it not time to rest?" "Rest," exclaimed Arnauld, "have we not sll eternity to rest in?"

Dr. Samuel Miller says: "There is no donbt that the prematnrs dotage of many distinguished men has arisen from their ceasing, in advanced life, to exert their facnlties under the impression that they wsre too old to engage in any new enterprise."

When John Adams was 90 years of sge he was asked how hs kept the vigor of his faculties np to that great age. Hs replied "By constantly employing them; the mind of an old man is like an old horse; if you wonld get any work out of it yon mnst work it all the time."

We may havs many remarkabls instances of earnest aud successful workers after they have passed into the psriod known as old ags.

Ecclesiastical history tells the story of Cassidorus, who, at ths age of 70 rstired to monastery and dsvoted ths remaining twenty ysas of his lifs to literature and rsligion; and of Epiphanius, who hecams an author at 64 aud wrote ssvsral largs works bsfors his death.

Betwesn ths ages of 58 and 67 Baxter wrots forty works; after the age of 66 soms of his most valuabls works were writen.

"Ths only rsmarkabls thing," says Hanna Moors, "which helonged to ms as an authoress, was that I had writen elevsn books aftsr the age of sixty."

Says Lord Brougham, at ths conclusion of his autobiography: "If any statsments have been feehly and inaccuratsly rsndsred, it may bs remembered that I began this attempt aftsr I was eighty-thres years of age, with snfsebled health, failing memory, and but slight materials hy ms to assist it."

Plato disd at ths ags of eighty-ons, it is said, with psn in hand; and an account is given of anothsr who wrote a history of his time at the ags of one hundred and fifteen.

Cundurango and Sarsaparilla.—The Philadelphia *Medical Times* remarks that "It waa not ths cnring of cancer, bnt it was the obtaining of a profit of somswhers abont 1,900 per cent. ($38 per ponnd on an articls costing not $2 per pound), that animated the advocates of cundurango. Ths hnhble has, however, been pricked; and we presnme that Messrs. Bliss & Keens, mors in sorrow than in anger, watch ths fading glories of their great spscific. They are making a fesble stand, or some ons is trying to do so for them, on its anti-syphilitic powers; this will psrhaps work off the stock they have on hand, bnt it will hsrdly do mors.

Onè point of cnrions dissimilarity may he noticed betwesn the medical history of this article and that of its analogus, sarsaparilla: namely, the comparatively short time reqnired for ths sxplosion of the claims of the formsr. Ths explanation is undonhtedly to he fonnd in the free and constant rsports of the resnlts of experiment all over ths world, which modern means of commnnication alons conld render possible. Sarsaparilla held its own in country nsighhorhoods, rstired towns, and rsmote places, long after it had besn trisd and fonnd wanting at ths grsat centrss of msdical sciencs. Cnndurango is known as a stnpsndous failurs wherevsr it is known at all."

Sprains and Bruises.—Thsse injuriss ars sometimss very distressing and their consequsnces vsry ssrions. The dsnss ligamsnts and synoval membranss of the joints swell, and somstimss inflame, as the result of local injnries, and the pain is oftsn sxtreme. Bnt simpls watsr is all the treatmsnt nscessary in any cass. It shonld howevsr, be of a tempsrature adopted to ths circnmstances, ths purpose being to unload ths congested vesssl of the injured parts as much as possible. If ths parts are hot and painful, apply cold water or cold wet cloths, frequently renewed, nntil ths heat hecomes normal. If thsre is pain or tendernsss without increased hsat apply fomsntations until the pain is relieved. All ths after dosing reqnired in either case is a wet cloth covsred with a dry ons, and worn until all tsnderness is gone. This simpls treatment will do all that any medication can do, and is hetter than all the liniments and lotions, plasters and poultices that wsre evsr invented.—*Science of Health.*

Cold in the Throat.—This diseass is manifsst in fowls by a noiss, as if aome aubstance had stuck in ths throat—phlegm is present in the throat. The following remedy ia highly recommended: A tablespoonfnl of water containing two dropa of the tinctnre of aconits, given two or three times a day, and plenty of fresh watsr to drink.

Frost-bitten Limbs—Shonld hs immsdiatsly hathed in cold water, and rnhbed until heat ia restored. Avoid warming numbsd hands and fset at ths fire.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. ROONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$6.00
One-half inch.....$1.00	$3 00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the papsr, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 3s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Oct. 19, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Oct. 17, 1872.—Legal Tenders having, 88¾; selling, 89. Gold in New York to-day, 113⅜.

Table of Contents.

ILLUSTRATIONS.—Reversible Water Filter, 241. Sectional and Horizontal Plans of Limestone Formations, 246. Sectional Vein of the Comstock Lode, 249.

EDITORIALS.—A Jury of Experts; A New Motor for Sewing Machines, 241. The California Slate Fair, 252.

CORRESPONDENCE.—Mining in Utah—List of Patented Mines—New Improvements in Salt Lake City—Walker House, etc., 242.

SCIENTIFIC PROGRESS.—Climatic Changes on the Earth; Boring for Science; Has Our Climate Changed; A True and Real Scientist; Barometric Pressure and Life, 243.

MECHANICAL PROGERSS.—Manufacturing Statistics; High Pumping; Dredging on Ocean Bars; Apparatus for Excavating Beneath the Surface of Water; To Cut and Bore India Rubber Stoppers; Tinning with Zinc Instead of Tin; A New Theodolite, 243.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho and Utah; Mining Shareholders' Directory, 244-5. Market Reports, 252.

USEFUL INFORMATION.—Oyster Babies; Antiquity of Fermented Liquids; Hydroscopy—What is It; Do Fishes Think; The Human Ear; What is a Hogget, 247.

GOOD HEALTH.—The Influence of School-Life on Sight; Tea, Coffee, Cocoa, and Alcohol; Mental Vigor in Old Age; Cundurango and Sarsaparilla; Sprains and Bruises, 247.

MISCELLANEOUS.—Notes on the Reduction of Gold Ores; Kern County Mines; Montana Fair, 242. Apparatus for the Firing of Mines by Electricity; Utah Railroads; El Dorado South Consolidated; Steam Plowing in Cuba; Lida Valley Mines; Mountain View Consolidated S. M. Co.; Business at Eureka Mills, 246. Columbus Mill and Mining Company; What is Said About Coffee; The Crosby and Judd Works; Progress in Utah; Railway Air-Cushion; Printing from Photographs, 250.

SAMPLING OF ORE.—Our readers will recollect the sampling works of S. W. Howland & Co., in this city, for the crushing and sampling of ores, in which a close approximate estimate of their richness is obtained, so that sales of parcels of ores are effected here. Mr. Howland, the pioneer in this business, who has for some time been absent experimenting on ores in Utah Territory, has lately returned, and having dissolved partnership with Mr. Thurman several months ago, has resumed business at his original quarters, corner of Drumm and California streets. He has introduced several improvements in his apparatus, the result of extensive experience. One of these consists in the construction of a false bottom to the mill in which the ore is finely pulverized, so that every minute particle can, it is claimed, be recovered, and a reliable sample obtained. Mr. Howland requests that when possible, owners of ores or their representatives will be present at the final sampling and cleaning up of their several lots, which will prevent the possibility of the manner of sampling being called in question by any party.

MINING ACCIDENTS.—Thomas Manning, a miner in the Meadow Valley mine, Ely district, was killed by a cave on the 10th inst.

Edwin T. Lake, Chief Engineer of the Eureka Consolidated Mining Company, was crushed to death in the machinery last week, while attempting to adjust a belt.

Notes of Travel in Nevada.

[By our Traveling Correspondent.]

The Comstock Lode.

The characteristics of the famous Comstock lode, its discovery, extent, geological features, the mines upon it, etc., have been commented upon by the press, technical works, etc., so often, that they are familiar to all interested in mining operations, I shall therefore only give your readers some slight idea of a few of the mines as they now are, instead of going into well known particulars; suffice it to say that the ledge was discovered in 1858 by some miners who were working gold placers. The black stuff, as it was called, or rich silver ore, which interfered with their mining operations, was taken to Mr. Melville Atwood, at Grass Valley, to be assayed, and a short time after the result was made known the great Washoe excitement broke out. This happened in 1860, and was one of the most important excitements which ever occurred on the Pacific slope, where the people are especially prone to "rushes" of this kind, now confined principally, to California street in your city.

Character and Extent of the Lode.

The Comstock lode runs nearly north and south along the eastern slope of the Washoe mountains, at the foot of Mount Davidson their loftiest peak, which is 8,080 feet above sea level. Its outcrop is not continuous but consists of parallel belts of quartz extending from east to west, and in many places nearly a thousand feet in width, visible chiefly on the tops of the highest spurs running down from the main ridge. The west wall is separated from the country rock by a well defined clay seam and keeps a uniform dip of about 40° to the eastward at the surface gradually increasing to 45° which it maintains to the lowest depth explored. Near the surface the east wall has a false dip west but gradually becomes vertical at 300 feet down and it turns to the eastward between 400 and 500 feet, and after that continues down more or less parallel with the west wall. This eastern, or hanging wall, is not so clearly defined as the foot wall, for it frequently drops down near to the latter. When this is the case another clay seam is usually found to the eastward. The length of the lode as far as known is about three and one half miles, extending from the Utah mine on the north side of Virginia city to the Overman on the south side of Gold Hill, the ledge matter varying from 20 to 600 feet in width, but not by any means all productive. The ore chimney runs like a wave; in some of the mines it appears near the surface while in the next one adjoining it may dip to the 400 foot level, rise to within one hundred feet of the surface in others and again dip to the one thousand foot level in another. This chimney of pay ore has varied from a few feet in thickness to between 400 and 500 feet. In some of the mines a second chimney of ore has been found, and even passed through, after passing through barren quartz, and this is one reason why so many companies are working at an apparent loss, for they all hope to strike this ore body.

Bullion Yield.

The yield of bullion from this extensive lode has been enormous, and various estimates have been made from different sources to ascertain its exact amount. The magnitude of the operations have been such as to render it difficult to obtain the correct figures in all cases, but it may be summed up as follows, without particularizing the yield of each mine:

From 1860 to Dec. 31st, 1869	$118,480,636
Jan. 1st, 1870, to Dec. 31st, 1870	11,790,713
Jan. 1st, 1872, to Dec. 31st, 1871	11,053,328
	$141,324,676
1872.	
January	$ 914,189 22
February	954,111 38
March	1,066,247 70
April	1,691,970 31
May	1,422,396 86
June	1,162,161 90
July	1,157,014 23
August (to 18th)	387,661 18
Yield Jan. to Aug. 18, 1872	$ 9,136,752 78
" from 1860 to Jan. 1, 1872	141,324,675 00
Total Yield	150,460,428 78

How much of this immense amount of money has been *profit* it is impossible to state. Some of the mines have been wonderfully productive and paid their owners handsomely, while others have realized nothing at all. In the early days as mining on the lode, and, in fact nearly up to the present time, the expenditures have been very great. Costly machinery and reduction works, high price of fuel, great cost of reducing ores, difficulty of transportation, all increased the expenses so much that only the richest ores could be worked to advantage. Now, railroads have exercised their usual influence, the country is settled with a permanent population, ore is worked at a comparatively low cost, rich ore has been found in the lowest levels of the deepest mines, and in fact all circumstances show that hereafter the profits from the mines will be greater than heretofore. The completion of the Sutro Tunnel will assist materially in effecting this needed change, since it will drain the mines and do away more or less with the expensive pumping machinery now in use, at the same time save the trouble of hoisting the ore such great distances. The bullion yield given above came from the following mines, commencing on the extreme north end of Virginia City and extending to the south end of Gold Hill.

[By reference to our illustration, the situation and number of feet in the mines on the lode, will be seen. The mines marked thus * and numbered from 1 to 16, located on Gold Hill, are so close together that it was difficult to get their names on the map. By referring to the table showing locations and feet claimed their names will be seen and the number of feet in each. The diagram is sufficiently clear as to need no explanation. Other diagrams, showing the geological formations and topography of the country, in connection with the Sutro Tunnel, will appear as soon as the engravings are completed.—Ens,]

As far as developments thus far go, the most of the wealth which is under Gold Hill seems to have concentrated in the Crown Point and Belcher mines. Still the success attending the progress of work in the deep levels of these two mines inspires the owners of the others with hope that the question of richness is only one of depth in the whole line.

The Crown Point

As well as the Belcher has the ore body growing richer and wider in the 13th level. The assays run all the way from $200 to $1,000 per ton and the vein is about 126 feet wide. In May the Crown Point mine paid $500,000 in dividends which money was obtained from 11,478 tons of ore from the 1200-foot level. During that month the ore averaged $65.67 per ton and the yield for the month was $819,000. In May, June and July the work on the 1200 and 1300-foot levels was temporarily suspended on account of water in the shaft and breakage of machinery. They then worked the upper levels which did not run so high. They then paid $300,000 per month dividends, but in August it was passed on account of a cave, although the earnings were $265,000. No dividends have been paid since that time by this mine. The mine is now yielding about 460 tons of ore per day from the 1100, 1200-ft. levels. The ore body in this mine now fills the walls, being 126 ft. in width on the 1100, 1200 and 1300-foot levels. This ore is sent to mill just as it comes without sorting, as there is no waste at all. Number of men employed in the Crown Point is 400. J. P. Jones is Superintendent and G. F. Kellogg is Foreman.

This mine, as well as the others on this lode, is literally infested with rats, a circumstance which must seem peculiar to persons unfamiliar with the fact. They are fat and hearty and instead of being an annoyance to the miners are looked upon as their friends. They find plenty to eat, scraps of lunch, candle ends, etc. The reason why the miners are glad to have them there is because their motions give them the alarm in case of an impending cave. At the time of the great cave a few months since all the rats in that part of the mine left, and the miners followed their example in time to save their lives. The probability is, that they felt a gradual contraction of their holes and natural instinct led them to arrive at the cause. Visitors will therefore be careful not to attempt to kill any rats in the mine unless they want to try their skill in fighting miners.

Belcher.

The Belcher is now working 350 men. D. B. Tyrell is Superintendent. This mine lies next adjoining and south of the Crown Point and as above stated owns 940 feet of location. The daily yield at present writing is about 260 tons of ore, taken principally from the 1000 and 1100-ft. levels. The main incline is sinking at a good rate and the station will be ready for hoisting about the 15th of October. The ore body in this mine is similar to that in the Crown Point in width, richness and other characteristics and opinions differ as to which will prove the richer. As regards the width of vein and the pay body there is little or no difference in either one. The Belcher has in the past been working under great disadvantage from being compelled to work its levels from the Crown Point, its shaft being 715 feet south of the Crown Point. All the ore it raises at present is carried through the 1100-ft. level of the Crown Point, across the Kentuck 90 feet and 200 feet into the Yellow Jacket to reach the Jacket shaft where it is hoisted. In this manner the last three levels, the 1000, 1100 and 1200 ft. have been opened. They have also sunk a winze to the 1300-ft. level. At the time of my visit it was excessively hot, the thermometer standing at from 90° to 115° in the mine; so hot that it takes from two to three men to the pick, that is one man works 20 minutes and goes to a cooler spot while another relieves him, and he is relieved in turn. The water from the 1100-ft. level is quite hot as it also is in the Crown Point from both the 1200 and 1300-ft. levels. The mine turns out in the neighborhood of 5,000 tons per month, which runs from $60 to $70 per ton. They have been paying regular dividends of $312,000 per month for some time. There is no conceivable reason why the same body of ore will not continue on into the Segregated Belcher and Overman, as it is known to exist in the Empire, Imperial and Kentuck.

The following will give some idea of the state of the workings of this mine at the time of my visit:

No. ft. main drift south from Crown Point line 1000-ft. level 200 in ore; do. 1100-ft. 590 ft. 300 ft. in ore; do. 1200-ft. level 120 in ore; average width of ore on track floor of 1100-ft. level 70 feet; length do. 300 ft.

The width of ore bed on the 1000 and 1200-ft. levels was not known. Depth of incline and shaft 1,150 feet. It is impossible to give any estimate of ore in sight, as the headings and cross-cuts on the various levels are not far enough advanced either upon the 1000 or 1200-ft. levels to allow even an approximation.

At or near the line of the Kentuck, in passing from the Jacket shaft to the Belcher mine, I encountered a livery stable, where there were two hale and hearty mules. They have been down there some months and are used to transport the cars of the different mines to the Jacket shaft for hoisting. The mules draw these ore cars about 1,500 feet.

Yellow Jacket S. M. Co.

Incorporated July 17th, 1862. There are 1,200 feet in the mine in 24,000 shares. Total product from incorporation to Sept. 1st, 1872, is $14,272,172; of this $12,772,173 was from bullion and $1,500,000 from sale of ores. Dividends declared since incorporation, 1 to 25 inclusive, $2,184,000; assessments levied, 1 to 14 inclusive, $1,518,000; excess of dividends over assessments, $666,000; or dividend per share, $91; and assessments per share, $63.25; net profit per share, $27.75. All above the 1,100-ft. level is worked out; 2 winzes sunk to 1300-ft. level from this one which is 300 feet north of shaft and 400 feet deep; and the other 550 ft. north of shaft and 450 ft. deep; on the 1200-ft. level one drift runs east from station 300 feet; on the 1300-ft. level one drift runs east from station 300; one drift north from this drift 550 feet; and one drift south from this drift 240 feet; on the 1400-ft. level one drift runs due east 125 feet; on the 1500-ft. level drift runs due east 85 feet; bottom of incline, vertical depth, 1,534 feet; about 180 men are employed in this mine. The officers of this mine are as follows: Trustees—Thos. G. Taylor, Wm. Sharon, D. L. Bliss, T. B. Storer and G. W. Hazleton. President, Thos. G. Taylor; Secretary Geo. W. Hopkins; Treasurer, Wm. Sharon; Superintendent, T. G. Taylor.

Chollar-Potosi.

This mine is now yielding about 170 tons per day worth about $31 per ton. The ore breasts in the Belvidere and Blue Wing sections are looking well. During the fiscal year ending June 1st, 1872, this mine produced 37,789 tons of ore, principally from these sections. The company milled 35,930 tons yielding $940,120—an average of about $26.17 per ton. The previous year, 84,681 tons were produced and the year before that 56,636 tons. The profit on the ore last year, after deducting expenses, was $7.44 per ton, the previous year the profit was $24.61 per ton against $8.06 in 1869-70. The amount disbursed to stockholders as dividends for the year was $252,000. This consisted of 8 dividends, one of $2 per share amounting to $56,000 and 7 of $1, each one being $28,000. The previous year the company disbursed dividends amounting to $1,946,000.

Savage Mine.

The daily production of the mine is 100 tons of ore. This comes from the 2d and 3d levels, of the North mine, 11th and 12th levels of the South mine, and from the 5th and 6th levels of the old mine, and taken together has been of a low grade. But the recent strike of a new body of ore on the 6th level of the old mine, about seven feet wide, and assaying $100 per ton, will materially raise the average value of the ore, and be an important acquisition if it should prove to be of the extent which is now anticipated.

At present they are extracting from the 11th level 50 tons, and from the 12th level 25 tons daily.

On the 12th or 1,500 foot level, so called, which is the lowest level yet opened, the work so far down has been principally to make connection with the winze down from the 11th level, which is about 30 feet from the South line of the mine, for the purpose of ventilation. This connection has been made, and furnishes plenty of air, and the drifting is now being continued on to the Hale & Norcross line. On the route of these connecting drifts, ore has been found, from which some very good assays have been obtained, and a cross-cut to the East shows the ore to be extending out in that direction, and indicating that the ore vein is quite flat, pitching fast to the East. There is such a decided improvement in the quality of the ore thus far met with on this level over that on the level above, that it gives much encouragement to believe that the vein matter which is very wide in this level will, on the next level below, concentrate into a body of productive ore.

The shaft, down to the 10th level is perpen-

dicnlsr. From that point it is carried down un an incline at an angle of 38 degrees, and this incline has now reached 160 feet below the 12th etation, leaving bnt a short distance to go to reach a point where another 100 foot station can he opened.

The shaft at the old mine on B street is in good repair; the engines and machinery for hoisting, work smoothly, and are amply snfficient for any work to be done there. The shaft on E street, which is the principal centre of the company's mining operations, and the shaft incline, are iu excellent condition. There are three powerful hoisting engines, working separately, ono for each compartment of the shsft, and althnugh they are now nsed forlifting from a perpendicular depth of nearly 1,600 feet, they are of sufficient power to lift from a considerably greater depth than that. Steol wire ropes aro nsed, five inehee in width aud three-eighths of an inch in thickness. There is also one large beam engine, used exclnsively for pnmping—a model of strength and of smooth and easy working, and with power enough tu pump 1,000 feet, at least calculation, deeper thau it is doing at present. Tho running of the engine six hours out of every twenty-four honrs is sufficient to keep the mine completely drained of water. Mr. A. C. Hamilton is the Superintendent of this mine.

Consolidated Virginia M. Co.

Working about 40 men. Main ehaft of three compartments—pump shaft 6x5 feet in the clear. Two hoisting shafts 4½x5 feet in the clear, each. Shaft down 500 feet, aud prospecting on that level, driving drift south in very promising quartz, carrying low-grade oree and cross-cutting; slso driviug prospecting drift north from the Gould & Cuary shaft 1,166-feet station, and at present making cross-cut west. New and heavy machinery is in course of construction, and will be orected immediately, wheu the sinking of the ehaft will he commenced to make connection with the 1,166-foot drift of the Gould & Curry. Sam. Curtis is Snpt. of the mine.

Senator S. M. Co.

Original nnmher of sharee of incorporation 24,000; J. E. Do La Montagnie Pres., Henry Boyle Sec., and H. V. S. McCullough Supt. This company's hoistiug works are located ahont 1,500 feet east of the Hale & Norcross, on what is snpposed to he a parallel ledge, or ledges. This corporation claim a location of 600 feet, running north and south, situated hetween tho Julia mine on their south and the Colnmbia on their north extension. Their improvemente consist of fine hoisting works, run by steam; their main working shaft is down vertically 260 feet, in three compartments, 6 by 15 feet. At a depth of 200 feet in this shaft, drifts are run, one east 100 feet and about 80 feet to the west; in this latter drift, a body of oro 8 feet thick was struck; it is low grade, assaying about $15 per ton; but betterindicatione are obtained for ever foot advanced. It is the intention of tbis company to sink some 800 feet and then cross-cut. The ledge matter in this mine pitches east at an angle of 45°. No 4 shaft of the Sutro tunnel is on a line with this company's shaft, and the tuunel when completed will pase within 150 feet of this company's works. Their main shaft will he pushed downward as fast as time and money will admit.

Virginia and Gold Hill Water Co., Virginia, Nev.,

Is an incorporation. A. K. P. Harmon is President; W. E. Dean, Secretary, and N. C. Hall, Superintendent. Thie company supply the principal portion of all the water consumed at the mills and the cities of Virginia and Gold Hill. The supply of water to furnish this Company's works is brought in wooden flumes a distance of from 2½ to 6 miles; ohtained hy tunneling into the eurrounding mountains. One of these tunnels is run into the mountain a dietance of 4,000 feet through the hardest kind of rock. They have a capaeity to furnish 50 inches of water daily, under three-inch pressure. This ssme Company are now engaged in constructing flumes and pipes, which are expected to he completed hy this time next year, for hringing in an additional supply of water from the Sierra Nevada mountaine, a distance of 27 miles; it is taken from the vieinity of Lake Tahoe. Another water company, known as the

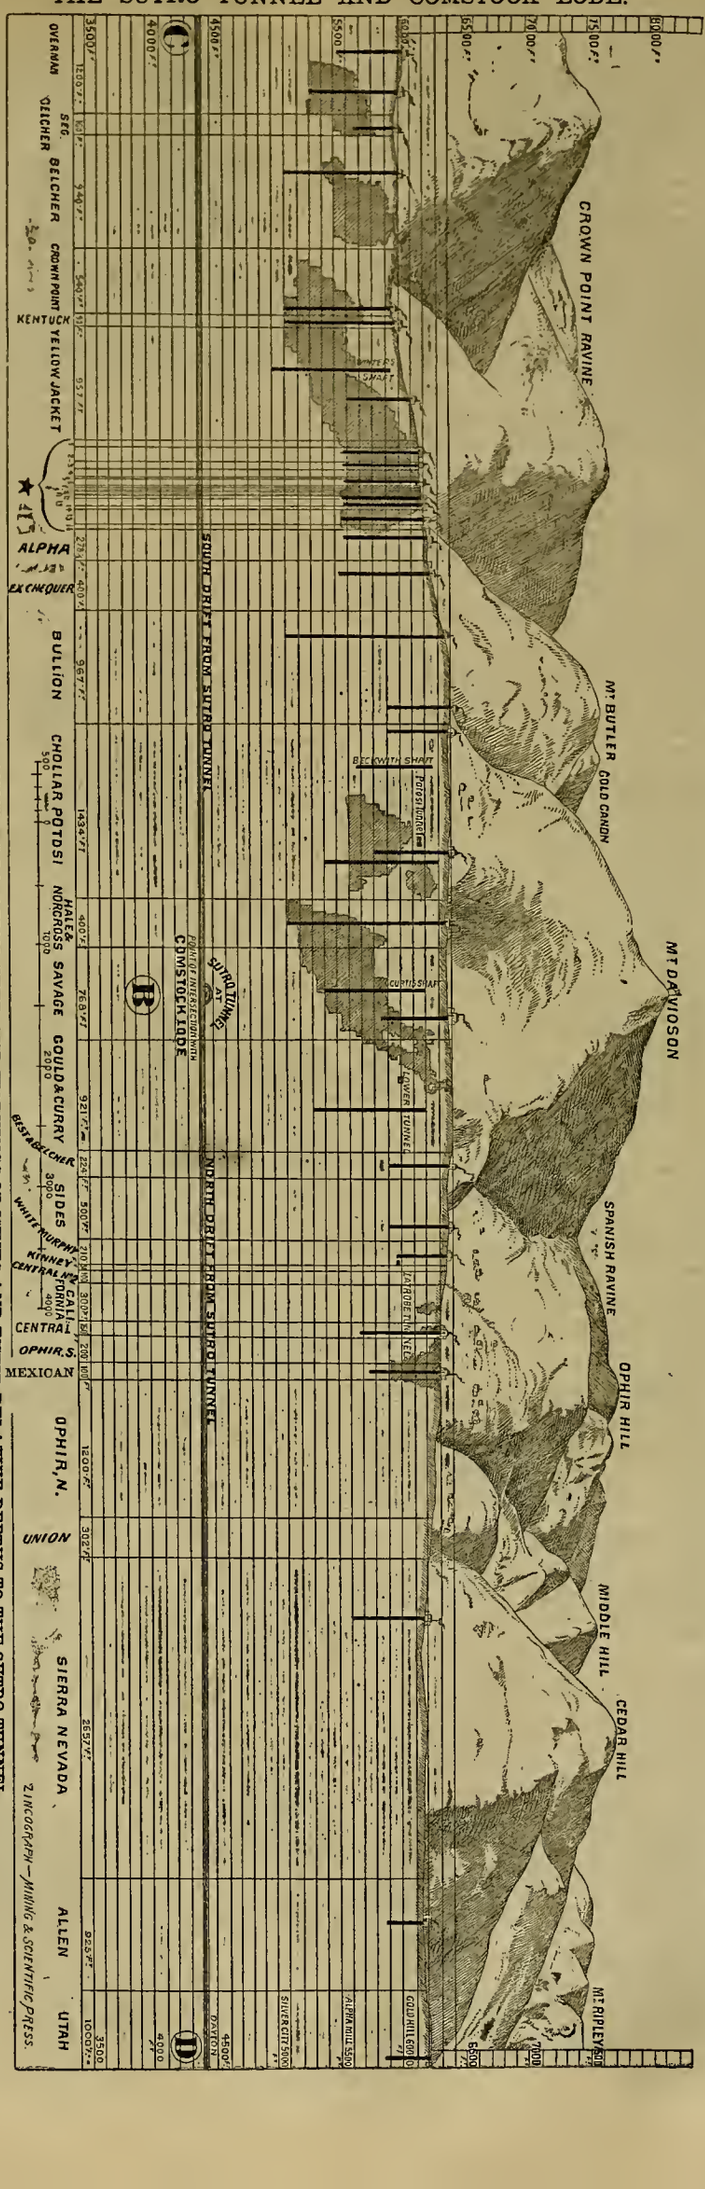
Cole Water Company,

A California incorporation, supply ahout one-fourth, or the halance of the consumption of water in this district. This Company ohtain their supply in a similar way to the ahovementioned one.

Neighboring Towns.

The neighhoring towns on and eurrounding the Comstock lode are numerous and are as followe: Virginia City, the principsl place, is the county eeat of Storey county, and contains a little over 10,000 inhabitants; elevation 6,260 feet; two excellent daily papers, the *Virginia Enterprise* and *Chronicle*, are published here, and the city has as much life and business as many of its size in older settled districts. It ie distant hy rail 344 miles from San Francisco. Gold Hill next in population is three miles south of Virginia City, at an elevation of 6,000 feet, in the same county, and has a population of 4,000. Passing from Virginia City to Gold Hill the stranger would uot know when he wae out of one town and into the other, for it ie settled eo thickly as to form in reality one place. On what is knowu as the "divide" between these two towne are eituated the foundries and machine shope. The following firme are carrying on the principal hueiness in that line: The Gold Hill Foundry and Machine ehop, Geo. Emmett, proprietor smploye ahout 60 men.

THE SUTRO TUNNEL AND COMSTOOK LODE.



The Fnlton Fonndry employs 50 men, John McCone, proprietor. Union Iron Works, Tyrrell & Cnmmings, proprietors, employ about 75 men. My attention was called to a spnr wheel in the latter shop, which is intended for the hoisting works of the Chollar-Potosi mine. This wheel 12 feet in diameter has a 12-ineh working face, and weighs 7¼ tons, as fine a looking casting as I have seen turned nut in your city. Among the fine buildings in Virginia City is the Odd Fellows' Hall, which will he completed abont February of the coming year. The structure will be 125 feet in length, runniug from C to D street, and fronting 45 feet on C street. It is 4 etories high on D street and three stories on C, owing to the great inequality of the ground. The public hall will be the entire length and breadth of the building with dressing rooms and galleries. The hnilding will cost when completed about $60,000.

American City lies 2½ miles sonthwest of Gold Hill; contains about 1,000 inhabitants. Silver City, one mile southeast of Gold Hill, is in Lyon county, and has a population of 1,500; elevation 5,000 feet. Dayton, the county seat of Lyon county, is 4 miles nearly east of Silver City, at an elevation of 4,500 fect; population 1,000. Sutro, in the same county, is three miles nearly north of Dayton and five miles due east of Virginia City. It is at the mouth of the Sutro Tunnel, an elevation of 4,400 feet. It contaius only ahout 300 inhabitants. These towns derive their principal eupport from the mines on the Comstock lode,

Timber and Improvements.

The timher that once covered the hills and mountains surrounding Gold Hill and Virginia, has all passed from sight. The visitor of ten years ago will ask, where hae it gone? Our answer wonld he, look at the husy tows and cities above enumerated for a portion of it; see the 50 different sets of extensive hoisting works, and half as many mills for another portion; hut go helow ground in the different working mines on this lode, and see the millions upon millions of feet of lumber and timhers used there. The visitor's next question will be "where else was this vast sea of timher ohtained?" for there is at the present writing a sufficient amount of timher underground on the Comstock lode, to huild 10 euch cities as that of Virginia Their lumber is now principally ohtained from the Truckee, and commands nearly double the price at present paid in your city; cord wood sells readily at $16 per cord. The timbers used in the mines are from 12 to 14 inches square, the timhering is fitted and placed in squares, both horizontal and verticle, 6 feet apart; aud each floor of 6 feet is covered with from 2¼ to 3 inch plank, for working purposes. When a cave occurs theee 14 inch timhers are crushed endwise as thongh they were made of tallow.

As an example of the amount of hlasting going on in these mines, I will give you the consumption of Giant Powder for the past three yesrs. The amonnt eold by one agent in Virginia City, General Van Boklin, was in 1869 and 1870, 15,200 lhs.; in 1871, 20,300 lhs., and up to this time in 1872, 48,800 lbs., and other agents are now selling ahout 20,000 lbs. per year also. It will he seen hy this that there is a vast and steady increase, not only in the use of this material, hut in blasting in mining operations on this lode. L. P. Mo.

Alto Relief Topography.—Chas. W. Hendel, St. Louis, Sierra County, exhibited at the State Fair, at Sacramento, a beautiful specimen of relief topography of portions of Plumas and Sierra counties, showing the corresponding hight of the ranges of mountains, the depth of cañons and ravines on each side of Slate creek. Also Bald Mountain, Tahle rock and the ranges connecting with Pilot Peak; the worked ground at La Porte, Gibsonville, Newark, Potosi, Howland Flat, Pine Grove, Chandlerville, St. Louis, Gardners' Point, Port Wine, Scales Diggings and other intervening and adjacent places, showing also the Blue Lead channel wherever developed; the different formation of rock, the heds of tailings in the creek, and the denuded hed rock being denoted hy different colors. We wish Mr. Hendel would send us a photograph for making an engraving of this fine piece of work.

The Beet Sugaries.—One at Alvarado the other at Sacramento, are hoth turning out sugar in large quantities and of superior quality. The success of the enterprise is estahlished heyond question. The per cent. of profit upon the investment must depend much upon the original coet of land, huildings and machinery. At Alvarado we learn the cost of land wae very nearly $200 per acre; at Sacramento $30 per acre.

A Wonderful Instrument.—At the recent State Fair, the exhihit of the Dictator and Little Giant Hydraulic Joint Apparatus, attracted the attention of old and young; we instance, that of a little fellow who very naturally asked his father—fathers are supposed to know every thing—the use of it. Taking a square look at the instrument, he replied: "It's a hot-water gun used for the protection of the decks of ships of war, hy turning a etream of hoiling hot water in any direction upon any unwelcome hoarders."

On File.—"Prospecting and Mining" hy T. S. Tunneling in Eureka Dietriot.

Domestic Economy.

To Cook Mushrooms.

As thers are, no douht, many who wonld hs plessed to learn of the msny wsys for cooking this fungus, we copy ths following from sn English paper :

Ths pssssnts of a great portiou of Europe eat mushrooms raw, witb salt and dry bresd, and wholssome and good they are. The true flsvor of mnshrooms, nevertheless, is grsatly hightened by cooking; and cook them how you may—a broil, a stew, or a fry, with the simple addition of butter, sslt and peppsr, and they ars excellent. There is one rule thst should alwsys be observsd in whatever mode tbey are cooked, and that is that they shonld hs servsd up quickly and hot. The following modes of cooking mnshrooms may prove ussful at this seasou of the ysar:

Mushrooms au Gratin.—Take twelve lsrge mushrooms, ahont two inches in diametsr, psre the stalks, wash and drain the mushrooms ou a cloth; cnt off and chop the stalks. Put in a quart stew-pan an ounce of hutter and half an ounce of flonr; stir over the firs for two minentes; then add one pint of broth; stir till rednced to half tbe quantity. Drain the chopped stalks of the mnshrooms thoroughly in a cloth; put tbem in the sauce with three tablespoonfuls of choppod and washed parsley, one tablespoon of chopped and washed shalot, two pinches of salt, a small pinch of pepper; reduce on a hrisk fire for eight minutes, put two tablespoonfuls of oil in a *saute* pan; set tbe mnshrooms in the hollow part outwards; fill them with the fine herbs, and sprinkle over them lightly a tablespoouful of raspings; put in a brisk oven for ten minutes, and serve.

Curbien Mushrooms.—Peel and remove the stems from a dish of full-grown mnsbrooms, sprinkle with salt, and add a very little hutter; stew them gently in a little good gravy or stock. Add four tablespoonfuls of cream, and one teaspoonful of curry powder, previously well mixed with two teaspoonfuls of wheat flour; mix csrefully, and serve on a hot dish, with hot toast and hot plates attendant. Mind the "curry stuff is good," says an Indian friend, and not too much of it. The word "curry," by itself, it seems, being merely the Tamul word for "meat." The large, horse-mushroom, when half or three parts grown, and curried in this fashion, will he found to he delicious.

To Pot Mushrooms.—The small, open mushrooms suit best for potting. Trim and rnb them; put into a stew-pan a quart of mushrooms, three ounces of bntter, two teaspoonfuls of salt, and half a teaspoonful of Cayenne and mace, mixed, and stew for ten or fifteen minutes, or till the mushrooms are tender; take them carefully out and drain them perfectly on a sloping dish, and when cold press them into small pots, and pour clarified butter over them, in which state they will keep for a week or two. If required to be longer preserved, put writing paper over tbe hutter, and over that put melted snet, which will effectually preserve tbem for many weeks, if kept in a dry, cool place.

To Pickle Mushrooms.—Select a nnmber of small, sound, pasture-mnshrooms, as nearly as possible alike in size; throw them for a few minutes into cold water; then drain them; cut off the stalks, and gently rub off the outer skin with a moist flannel dipped in salt; then boil the vinegar, adding to each quart two ounces of salt, half a nutmeg sliced, a drachm of mace, and an ounce of white pepper-corns; put the mnshrooms into the vinegar for ten minutes over the fire; then pour the whole into small jars, taking care that the spices are equally divided; let them stand a day, theu cover them.

Another Method.—In pickling mushrooms, take tbe huttons ouly, and while they are quite close cut the stem off even with the gills, and rnb them quite clean. Lay them in salt and water for forty-eight hours, and then add pepper and vinegar, in which black pepper and a little mace have been hoiled. The vinegar must be applied cold. So pickled they will keep for years.

Mushroom Stems, if yonng and fresh, make a capital dish when the supply of mushrooms is limited. Rub them quite clean, and after washing them in salt and water, slice them to the tbickness of a shilling, then place them in a saucepan with sufficient milk to stew them teuder; throw in a piece of butter and some flour for tbickening, and salt and pepper to taste. Serve upon a toast of bread, in a hot dish, and add sippets of toasted hread. This makes a light and very delicate supper dish, and is not bad sauce to a boiled fowl.

Breakfast Mushrooms.—Clean a dozen or so of medium-sized, place two or three ounces of nice clean beef-dripping in the frying-pan, and with it a tablespoouful or more of nice beef gravy. Set the pan on a gentle fire, aud as the dripping melts place in the mushrooms, adding salt and pepper to taste. In a few minutes they will be cooked, and heing soaked in the gravy and served npon a hot plate, will form a capital dish. In the absence of gravy, a *soupcon* of "extractum carnis" may be substituted.

Mushroom Soup.—Take a good quantity of musbrooms, cut off tbe earthy end, and piok and wash them. Stew them with soms hutter, pepper, and sslt in a little good stock till tsndsr; tske them out, and chop them up quits smsll; prepare a good stock as for any other soup, and add it to tbe musbrooms and the liquor they have heen stswed in. Boil sll togsther, and servs. If whits soup hs desired, use the whits hutton musbrooms and a good veal stock, adding a spoonful of cream or a little milk, as ths color may require.

Mushrooms and Toast. — Peel the mushrooms and take out the stsms. Fry thsm over a quick fire. When tbe butter is melted take off the psn. Squsezs the juice of a lemon into it. Let ths mushrooms fry again for soms minutes. Add salt, pepper, spices snd a spoonful of water, in which a clovs or garlic, baving bssn cut into pisces, has soaked for hslf an hour; let it stsw. Wben ths mushrooms are dons, make a thickening of yolks of eggs. Pour tbe mushrooms on bread fried in butter, and laid in a dish ready for them.

Baked Mushrooms.—Pesl tbe tops of twenty mnsbrooms; cut off a portion of tbs stslks, and wips tbem carsfully with a piece of flannsl dipped in sslt. Lay the mushrooms in a tin disb, put a small pisce of hutter on the top of sach, and season tbem witb pepper and salt. Sst the dish in the ovsn, and bake from twenty minutes to half an hour. When done, arrange them high in the ceuter of a very hot dish, pour the sauce round them and servę quickly, and as hot as you possiòly can.

Mushrooms a la Creme.—Trim and rub half a pint of button mnshrooms, dissolve two onnces of butter rolled in flower in a stew-pan, then put in the mnshrooms a bunch of parsley, a teaspoonful of salt, half a teaspoonful each of wbite pepper and of powdered sugar, shake the pan round for ten minutes, then beat up the yolks of two eggs, with two tablespoonfuls of cream, and add hy degrees to the mushrooms; in two or three minutes you can serve them in the sauce.

Mushrooms on Toast.—Put a pint of mushrooms into a stew-pan, with two ounces of hutter rolled in flour; add a teaspoonful of salt, half a teaspoonfnl of white pepper, a hlade of mace powdered and half a teaspoonful of grated lemon; stew till the hutter is all ahsorbed, then add as much white *roux* as will moisten the mnshrooms; fry a slice of hread in hutter, to fit the dish, aud as soon as the mushrooms are tender serve them on the toast.

To Stew Mushrooms.—Trim and rub clean a half pint of large button mushrooms; put into a stew-pan two ounces of butter, sbake over the fire until thoronghly melted; put in the mushrooms, a teaspoonful of salt, half as much pepper, and a small piece of mace pounded; stew till the mnshrooms are tender, then serve them on a hot dish. They are usually sent in as a hreakfast dish, thus prepared in hutter.

Mushrooms a la Provenoale.—Take mushrooms of good size. Remove the stems aud soak them in olive oil. Cut up the stems with a clove of garlic and some parsley. Add meat of sausages, and two yolks of eggs to unite them. Dish the mushrooms, and garnish them with the forcemeat. Sprinkle them with fine oil, and dress them in an oven, or in a *four de campagne*.

Mushrooms En Raoout.—Put into a stew-pan a little stock, a small quantity of vinegar, parsley and green onions chopped up, salt and spices. When this is about to boil, the mushrooms being cleaned, put them in. When done, remove them from the fire, and thicken with yolks of eggs.

Mushrooms with Bacon.—Take some full-grown mnshrooms, and, having cleaned them, procnre a few rashers of nice streaky bacon, and fry it in the usual manner. When nearly done, add a dozen or so of mushrooms, and fry them slowly until they are cooked. In this process they will ahsorh all the fat of the bacon. and with the addition of a little salt and pepper, will form a most appetizing breakfast relish.

Mushrooms En Caisse. — Peel the mushrooms lightly, and cut them into pieces. Put them into cases of huttered paper, with a bit of butter, parsley, green onions and shalots chopped up, salt and pepper. Dress them on the gridiron over a gentle fire, and serve in the cases.

Columbus Mill and Mining Company.—The Reese River *Reveille* of Septemher 4th says: "The Columhus Mill and Mining Company are pnsbing operations ahead in Columbus District. J. Miller, the Superintendent, is in town, and will leave for Columbus in a day or two. A ten-stamp mill and a White furnace are heing erected, which are expected to he in operation in abont six weeks. A rock-crusher will he attached to the mill, and it ie estimated that twenty tons of ore per day can be reduced hy the works. The Company own ten or twelve mines in the District, four of which have heen thoroughly opened, and show large bodies of fair grade ore, tbe ledges varying from tbree to ten feet in thickness. There are at present ahout 300 tons of ore on the dumps, with plenty more in sight. Twenty men are at present engaged in extracting ore, and the force is to bs douhled in the course of a couple of weeks. From information which we deem reliable we are convinced that this is one of tbe finest properties in Eastern Nevada, and we expect to be enabled in the course of a few months to chronicle handsome returns from that section."

What is Said About Coffee.

Ths coffee tree csms originslly from sfrica whers from time immemorial it has beeu cultivsted on tbs declivities of Ahyssinia thst slope towsrd the Red Sea. Ahont ths fifteenth century, somsthing like four hundred years ago, the coffes tree crossed tbis sea and penetrated into Arahia, where it hss sincs been cultivated, and whsncs especially ws gst the famous coffee of Mocba. Ths use of coffee spread very early and with great rapidity in the East. It penetrated Europs much more slowly, snd it wss first taken into France at Msrseilles.

Coffee was first drunk in Paris in 1667. The seeds which furnished it wsrs brought in small quantity by a Frsnch traveler named Tbsvenot. Two ysars afterwsrd, in 1669, Soloman Aga, Ambassador of the Suhlime Ports in tbe time of Louis XIV., induced tbe courtessns of tbat great king to taste it, and thsy found it vsry agreeahls. Howsver, its nse did not spread for a long tims. It was not untill the eighteenth century that it begsn to bs generally ussd. In fact it is scarcely a century and a half since it hecame an articls of general cousumption hy the people of Europe.

During many years Europe remained tributary to Arahia for this commodity. All ths coffee consumed in Europe came from Arabia, and particularly from Mocba. Toward the commencement of the eighteenth century the Dutch attempted to import it into Batavia, one of their colonies in the Indian Archipelago. They succeeded very well. From Batavia some stalks were taken to Holland and put in a hothouse, where they succeeded equally well. One of these stalks were brought to France toward 1710, and was placed in the conservatory of the Jardin des Plantes, and there also it prospered and gave growth to a number of sprouts.

In 1720 or 1725, (we have not heen ahle to find the precise date) an officer of the Freuch Navy, Captsin Dsselieux, thought that, since Holland had cultivated coffee at Batavia, he might also acclimate it in our colonies of the Gulf of Mexico. When emharking for Martinique, he took from the Jardin des Plantes three stalks of coffee, and carried them with him. The voyage was long and difficult, hy reason of contrary winds. The supply of water proving insufficient, it was necessary to put the crew on ratious, Captain Deselieux, like the others had but a small qusntity of water to drink each day. He divided it with his coffee plants.

Notwithstanding all his care, two died ou the passage; only one arrived safe and sound at Martiniqne. Put at once into the earth, it prospered so much and so well that from it have descended all tbe coffee trees now spread over the Antilles and tropical America. Twenty years after, our Western colonies exported millions of pounds of cóffee. You see the coffee tree starting from Africa, has reached the extremety of Asia on the east and America on the west. Hence it has nearly traveled round the world. Now in this long voyage, coffee has hecome modified.

Passing by the tree, of which we know so little, let us consider the seed. We need not he growers to know the different qualities of coffee and their different production. Nobody would confound Mocha with Bourbon, Rio Janeiro with Martinique. Each of these seeds carries in its form, in its proportion, in its aroma, the certificate, so to say, of its birth. Whence came these changes? We cannot know the certainty, and explain the why and the how, and follow vigorously the filiation of canse and effect; hut, considering the phenomena as a whole, it becomes evident that it is to difference of temperature, of climate, of culture, that all these modifications are due.

This example taken from vegetahles, shows that if we transport to considerable distances different specimens of the same vegetahle, placing them in different conditions of cultivation, we obtain different varieties. And tea, transported some years ago into tropical America would present us with like facts.—*Popular Science Monthly.*

The Crosby & Judd Works.—We have just returned from an inspection of this Amalgamation Mill. It is now completed, and seems to be perfect in all its appointments. Its machinery was put in motion to-day, and on Friday or Saturday will produce its first hrick.

This grand fabric has been put np in about six months, at a cost of ahout $50,000. It is calculated to roast, pulverize, chlorodize and amalgamate about 15 tons of ore per day when in perfect running order. The starting of this mill is another of the hopeful signs of Georgetown. We think this mill can run $400,000 worth of bullion a year, wbilst Stewart's, whose capacity is about one-third larger; can run $600,000. This will make a round million a year from two of our works. We cannot but wish the most abundant success to the enterprising founders of all our mills. We expect hereafter to report the weekly product of the Crosby, as we uow do the Stewart works.—*Colorado Miner.*

Progress in Utah.

It is astonishing with whst rapidity the country wsst of tbe Wabsatch range is heing developsd and brought into uss to sustain a wonderfully incressing popnlstion. Wben it is remembsred thst scarcely less than a quarter of a century ago tbe whole western conntry from the Missouri rivsr to the Pacific Cosst was almost one vast dessrt, and now inhshited by hundreds of thousands of energetic people, who bave built up cities, towns, villages, railrosds, and who hsvs developed the agricultursl and mineral resources of the country, it ssems almost a msrvel, so much so that hsd any ons predicted twsnty-fivs yesrs ago wbat is actnally in existence to-day, that individual would he pronounced insane. Yet the facts of progress are before us, and in no one circnmstance do we notice tbe svidence of rapid progress more tban in ths building of railroads. Formerly it was ths idea to settle countries first and thsn build railroads. Now this ordei of tbings is rsvsrsed, and capitalists build rsilroads in order tbst ths country may be settled and brought under tbe influence of civilizstion. We see this idea exsmplified in tbe building of ths Northern and Southern Pacific Rsilroads, and in the rspid sttling up of the country slong tbe lines.

Ths opening up of Utsh and Nsvsda within the past two years hy means of railroads, is something remarkahls, and the probabilities are tbat within ths next tsu years, thsss and adjoining Territories will bs interwoven with a series of broad and narrow-gauge roads as dense as in many of onr oldest States. Utah's north and Sonth lins, intersecting the great continental trunk linss, we helisve will bs fed by innumsrable narrow-gauge roads, from almost every direction. * * * If tbe picture drawn of the future seems overcolored, we point to the events of tbe past two years in justification of our faith in the future commercial prosperity of Utah, as a land redeemed from sage-brush and the dominion of antiquated ideas.—*Salt Lake Tribune.*

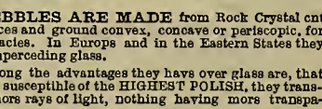
Railway Air-Cusheon.—Persons nnused to travel often suffer much fatigue in the lower limbs from a long journey by rail, which is attrihuted to the tremulous motion commnnicated from the floor of the car. Those who hsve exsrienced the difficulty there as in walking over a bridge or a loose plank road while a vebicle is passing, by the painful effort required to keep the legs in trim, will appreciate the case. As a preventive it is recommended to rest the feet on an air-cusheon, and foot-stools of a proper construction have heen made for this purpose. All invalids and persons unused to hsrdships would do well to supply themselves with this simple convenience before starting upon a long railroad journey.

Printing from Photooraphs.—A method of printing from photographs adopted in Prussia consists in the employment of a sensitive film of gelatine containing bicbromate of potash. This film is spread upon thick glass, and after exposed in the camera in the usual way, the photographic image is fixed by liquid ammonia. The picture is invisihle until the inking roller has passed over the glass plate, which may be printed from much the same way as a litbographic stone. About 5,000 impressions have been taken from a glass plste prepared in this way, the plate being in all cases strong enongh to be capable of heing passed through the press without injury. The procese has heen adopted at Krupp's works in Essen.—*Am. Manufacturer.*

Nature is the ouly workmau to whom no material is worthless, the ouly ohemist in whose laboratory there are no waste products, the ouly artist whose compositious are iufiuitely varied, and whose fertility of invention is inexhaustible.

The proportion between the width and length of single doors for a dwelling should be as two is to fonr.

"Clear as Crystal."



PEBBLES ARE MADE from Rock Crystal cnt in slices and ground convex, concave or periscopic, for Spectacles. In Europs and in the Eastern States they are superceding glass.

Among the advantages they havs over glass are, that heing susceptible of the HIGHEST POLISH, they transmit mors rays of light, nothing having mors transparency.

They ars COOLER to the Eyes—a very important gain.

They ars much harder than glass, and DO NOT SCRATCH.

The hest quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses hy the best workmen in England and France, for

DREYFUS' PATENT SELF-OILERS,
For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes.

PACIFIC STONE COMPANY.
Ransome's Patents,
For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.
The Pacific Stone Company call the especial attention of Architects, Engineers and the public in general, to the SUPERIOR QUALITY of the Stone now being manufactured by them in this city under the Ransome Patents. They make to order and keep in stock:
Building Fronts, Water Pips
Sinks, Monuments, Fountains,
Tiles, Copings for Walls,
Filters, etc., etc.,
Together with Ransome's Celebrated Free-Grit Grindstones, all of which we guarantee superior, and at a price far below that of hand-cut work.
The attention of private parties intending to build is respectfully solicited.
OFFICE, No. 10 BUSH STREET, San Francisco.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by
HUCKS & LAMBERT.
The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus
Relieve the Draft of the Team,
Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as
LOW A RATE
As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.
HUCKS & LAMBERT
invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

SAN FRANCISCO AND COLORADO RIVER RAILWAY.
Office of the San Francisco and Colorado River Railway Company,
NO. 305 SANSOME STREET,
SAN FRANCISCO,.....SEPT. 24, 1872.
TO THE PUBLIC.
THE BOARD OF SUPERVISORS OF THE CITY and County of San Francisco, having passed an Ordinance submitting to the Electors the question of granting a subsidy to our Company, for the Construction of a Railroad to the Colorado River, to connect with the railroads being built from the East, we are now in a better position to ask the citizens of San Francisco to join us and urge the importance of the undertaking; and beg to say:
First—We propose in good faith to build a first-class railroad, with all the dispatch possible, and certainly within the time provided in the ordinance.
Second—We pledge ourselves as men to the fact that we are entirely disconnected and free from all association with the Central or Southern Pacific Railroad Companies or their Managers or Directors, and are in genuine competition with them, and we have no association or connection with any other Railroad Company or combination in existence, and expect to have none, except business or running arrangements with lines from the East and South, which hereafter may desire to exchange business with us.
Third—We invite every citizen of the City and County of San Francisco to subscribe to our stock. Our Books are open to all. Our Company is not a close corporation, and in no sense a monopoly. We particularly invite every Taxpayer to subscribe, at least as much as he will be called upon to contribute to the subsidy, and thus, in a manner, free of legal difficulties, participate in the advantages growing out of the enterprise.
Fourth—A Committee of the Board will be in attendance at the office of the Company, No 305 Sansome street, to receive subscriptions, and duly authorized parties will wait upon the citizens generally, giving them an opportunity to subscribe.
Fifth—This being an independent and competing road, there can be no reason for those who desire the success of such an enterprise to decline their co-operation, which we cordially invite.

John Charles DeVoy, of San Francisco, Cal., An Improved Ink Erasing Compound, dated August 6th, 1872.

George Swift, of San Francisco, Cal., Improvements in the manufacture of pnlp, from vegetable fibres, for making paper and other materials, dated April 8th, 1872. (Provisional Protection).

*The patents are not ready for delivery by the Patent Office until some days afterward.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The California State Fair.

Exhibition of Manufactures, Inventions, Etc.

[Continued.]

Late Rose Potatoes.—Chas. H. Dwinelle exhibited the first Late Rose potatoes raised in Cal. to our knowledge. They were very fair and give promise of being an acquisition to our number of good varieties. Also samples of the Peerless potato; which variety is said to be well adapted to adobe soils in localities where other potatoes will not grow well. The seed were obtained from the East through the Pacific Rural Press. A small quantity of the Late Rose are for sale at $4 per ponnd, by C. H. D. of Oakland, to parties desiring them.

The Wax Work of Madam Anna Gettz Lucas, of No 719 Howard St., S. F., we think will challenge world wide competition. We found her bnsy giving practical lessons in the manufacture of wax flowers. Her exhibit comprised a large variety of articles; we cannot do justice by description of any of her fancy fruit and flower pieces. No admirer of her beantiful as well as useful art will be disappointed by a personal interview and an examination of her work. A perfect *fac simile* of a 7-pound pear raised in this State, is one of her fine pieces which we hope soon to illustrate in an engraving.

Flowers and Plants.—Mr. O'Brien, of Sacramento, gave the largest display of flowering plants and ornamental trees and shrubs. The oleander is prominent in the gardens in Sacramento. Mr. O'B. showed a fine assortment of thrifty trees of the different varieties of this tree.

Challenge Mill.—M. S. Bowdish, of Hawley & Co.'s hardware store, S. F., exhibited this superior mill for grinding barley, corn, oats, etc., however green, wet or dry, with ease and speed, without heating the feed or doing it other damage. It ie essentially a mill for domestic use and economy. Quite a number have already been sold on this coast.

Car Coupling.—We examined with interest Jas. Pearson's car-coupler, an invention calculated to save labor and life in coupling and uncoupling cars.

Patent Punch.—This punch was patented through the agency of Dewey & Co., by D. A. Falkner, S. F. It is especially desirable for plow and carriage manufacture. As a California invention it is of value enongh to support its manufacture here, and we recommend its early introduction East.

Automatic Car Coupling.—J. A. Leaman exhibited his improved automatic car conpling, which we shall probably illustrate in a future number.

New Incorporations.

Caroline M. Co.—October 10. Location: Ely district, Lincoln Conuty Nevada. Capital stock, $3,000,000. Trustees—Jamee B. Haggin, Jesse Wall, Robert Sherwood, George W. Beaver and Charles E. Elliott.

Gray and Bishop M. Co.—October 10. Location: Ely district, Lincoln county. Capital stock, $3,000,000. Trnstees—Charles Richards, H. H. Flagg and S. Bishop.

Anthony Gold M. Co.—October 10. Location: Newcaetle district, Placer County. Capital stock, $1,000,000. Trustees—J. E. de la Montagnie, S. D. R. Stewart, O. Dickinson, Jr., S. W. Lee and W. C. Chapman.

Aspinwall Con. G. and Silver M. Co.—Oct. 16. Location: Coleman District, Lyon Co., Nev. Capital stock, $4,500,000 in 90,000 shares. Trustees — Wm. B. Cobb, N. K. Lawson and Robert Harrieon.

Mobile S. M. Co.—Oct. 16. Location: Ely District, Lincoln Co., Nevada. Capital Stock, $3,600,000 in 3,600 shares. Trustees—G. A. Treadwell, J. E. Kincaid and J. J. Moynihan.

San Francisco Quicksilver M. Co. — Oct. 16. Location: San Luis Obispo Co., California. Capital, $3,000,000, in 30,000 shares. Trustees—Wm. H. Knight, Albert Williams, W. D. Delaney, John A. Robertson and Charles A. Denison.

Mountain Pear M. Co.—Oct. 16. Location: Gold Hill District, Storey Co., Nevada. Capital, $150,000 in 30,000 shares. Trnstees—H. Bruckmaer, H. H. Flagg, L. B. Franklin, J. Gutte and Wm. H. Bremer.

Increase of Capital Stock.—The California Powder Works have filed with the County Clerk a certificate of increase of capital stock, from $450,000, divided into 4,200 shares, to $1,000,000, divided into 10,000 shares. The certificate etates that the 45,000 capital is fully paid in, and the debts and liabilities of the Works are $11,361.73.

Meetings and Elections.

Gravel M. Co.—The first annual meeting of the stockholders of this Company, Schell Creek, was held on the 3d inst. The following Trustees were elected for the ensuing year: M. L. McDonald, James Gamble, Albert S. Evans, W. H. Gamble, and S. Urquart. James Gamble was elected President, W. H. Knight, Secretary, and Caleb Whitlng Superintendent.

Julia G. & S. M. Co.—Oct. 14. Trustees—M. D. Townsend, Geo. W. Fieher, Wm. H. Sears, E. G. Lyone, and E. Heetres. The officers elected are Geo. W. Fieher, President; E. Heatres, Vice-President; M. D. Townsend, Treasurer; A. Noel, Secretary; Frank M. Thayer, Superintendent.

Eureka (Grass Valley,) M. Co.—Oct. 17. Trustees—George W. Beaver (President); R. F. Morrow, William Watt, L. S. Adams, S. B. Sherwood; Superintendent, William Watt; Treasurer, Francis Berton; Secretary, R. Wegener. The receipts for the year were $233,409; dishursements, $202,622; cash balance on hand September 30, 1872, $56,655. Only one dividend of $20,000 was paid in the year.

San Francisco Metal Market.

Bargion's Improved Hub and Axle.

A patent has recently been procnred throngh this agency by Peter Bargion, which fills a want long felt, and which will most probably be generally adopted. It ie an improvement in the manner of securing boxes in the hnbs of wheels, and is more especially applicable to the cast-iron wheels nsed in gang and other plows, and reaping and mowing machines and all other agricultural machinery. There is also a device for preventing sand from working into the box and cutting it out.

In the hub of a wheel, such as ie used in agricnltural implements, a hole is bored ont large enongh to make a square channel at one side of the bore entirely throngh the hub. At about the middle of the bore is a short channel at right angles to the other channel and communicating with it. The box has a projecting flange or rim at one end, and aleo a lug projecting from it at a proper distance from the flanged end, to be turned into the short channel in the manner of forming a bayonet lock after the box has been slipped into the bore of the hub, the lug passing in through the long channel. A flange is also recessed opposite the long channel, and a wooden or other key confines the box in place, and prevents it from shifting.

On the axle a flange is made at the proper distance from the end of the journal to fit against the inner end of the box. This flange is large enongh to fit in the recessed end of the box, and has its onter corner beveled off so as to exclude any sand or dirt which would otherwise get into the box. In order the better to protect the outer end of the box from dirt and sand a nut is employed, having a large beveled flange or head, which screws upon the outer end of the journal. By this means both ends are protected so that dirt and sand can not get in.

The object of this construction of the hnb and providing it with a box is to save the wheel when the box is worn out, as all that it will be necessary to do will be to get a new box and the wheel will be ready for use again. At present in nsing agricultural implements the wheels have to be bushed repeatedly with Babbitt metal, occasioning loss of time and great inconvenience. By using this device the necessity of this will be entirely obviated, for as soon as the box wears out a new one can be procured. The box as above described is merely a cylindrical sleeve with channel, and it may be made by any blacksmith, though they will most probably be easily procnred at trifling expense. This invention is also applicable to axles of wagons, etc., and with light hubs may be also used on buggies and carriages. Those desiring further particulars on the subject can address, Alex. Weed, 443 California St., S. F.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and scienca, by assisting Agents in their labors of canvaseing, by lending their influence and encouraging favors. We intend to eend none bnt worthy men.

A. C. Knox, City Soliciting and Collecting Agent.

Office of the Chicago Terra Cotta Co.
Chicago, July 19th, 1872.

L. P. Donge, Esq., Sir—The Pulverizer you have furnished for the above Company is an A. No. 1 Grinder. Having used 4 feet horizontal etones, and verlical iron clad hurrs, for eeveral veare, in grinding materials for Terra Cotta, I am willing to say upon the trial we have given yonr machine that it is the best machine we have as yet met.

The great difficulty with Burrs is the wear, when snch material as Glass, Terra Cotta, Flint and Clay are ground, and the consequent stoppage and dressing of stones. But if as you affirm the Pulverizer will wear for six months without renewing of paddles, this trouble is gotten over, at a great saving of time and wages.

We have ground 1,600 lbs of glass in one honr and 150 hnshels of clay in five hours with it, without any trouble; other than it grinds too fine, being an impalpable powder; if it could be made to deliver in a more granular form, say 40 mesh, it would serve ue better; still this is a qneer fault for a grinder, that it does its work too perfectly.

Our Works are at the cor. of Catharine and Lafiin Sts., via Blue Island ave. cars, and you are at liberty at any time to refer to the machine, and we shall be glad to show its action on glaee or other stock material, and visitors will alwaye find enough to repay a visit.

Yours truly,
JAMES TAYLOR,
Sup't at Factory Chicago Terra Cotta Co.

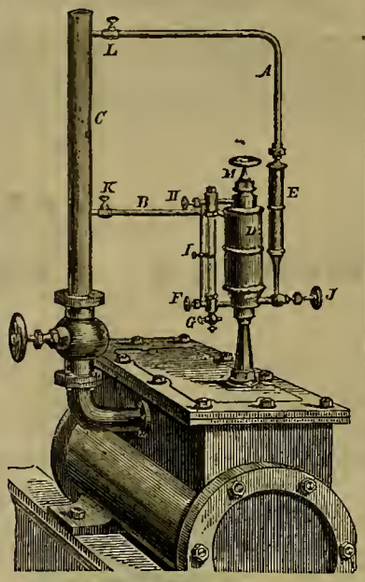
Should see that their advertisements are advertised legally in the MINING AND SCIENTIFIO PRESS, at less than one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of dates for weekly advertising, free blanks, and a copy of the Corporation Assessment Law.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by ths Mcchanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to bs superior to any thsy have ever usnd; fesd constantly by pressurs of condsnsed water, supplied by pips A, rsgulated under ths oil by valve J, and forced out through chsck valve and pips B into ths steam pips C; it tbsn bscomss greasy steam, passes to all the valves and cylinder at evsry stroke of the sngine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the pieton will not corrode. One pint of oil will last from three to six days, according to speed and size of sngins; I, sliding gaugs; K, valvs to shnt off when engine stopps; H, F, valvss to shnt off in cass of frost; steam does not snter ths cnp; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactursd by California Brass Works, 125 First strset, S. F. 24v23tf

TREADWELL & CO.'S UPRIGHT SAFETY ENGINES.

2 to 10 Horse Power.

Made by ths N. Y. Safsty Steam Power Co. Has tubular boiler, and thersfors is secure against the dangers common to shell boilers without tubes. Power is taken from near the bsss, which avoids vibration or top-heaviness. Occupiss but two feet squars of floor space, and is so simpls a boy can run it. All its parts are easily acceeeible—a great advsntags. Is complete in itself as a Portable Engins and Boilsr, or ths engins can bs detached from ths boiler and run independently, if required. Its main points are simplicity, eafety and economy. For printing offices, laundries, tanneries, ranchss, small repair or machine shops, or for hoisting whsrever a small and safs powsr is required, they are peculiarly adapted. Over 500 are already in use. ☞ Send for circular and price list to TREADWELL & CO., Sols Agents, San Francisco. 11v25eow-tf

Machinery and Castings of all kinds.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

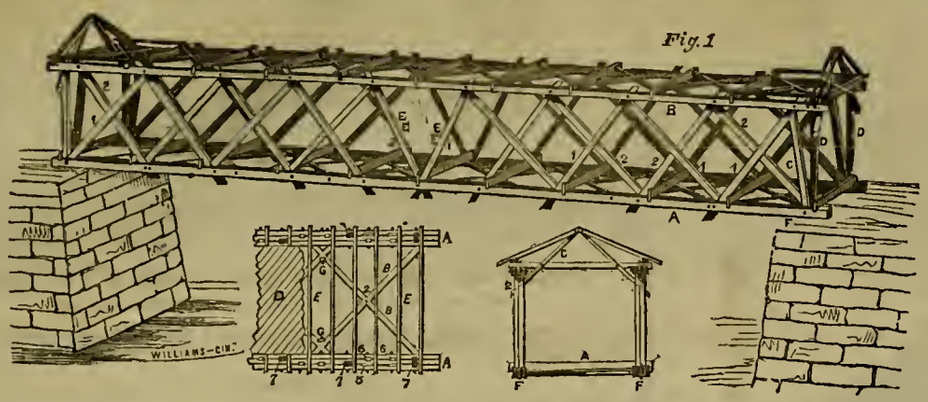
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

PACIFIC BRIDGE COMPANY,

Fig. 1



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

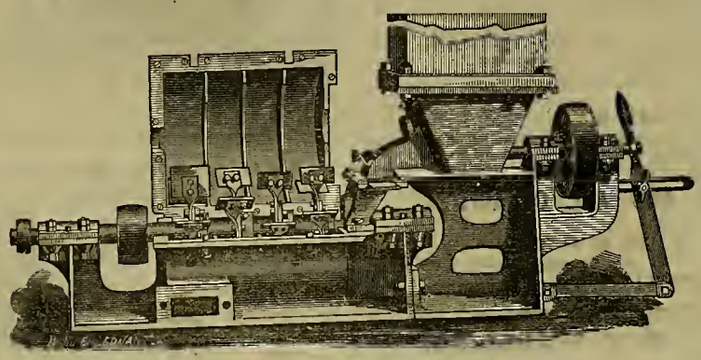
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operations. Respectfully, J. W. JONES, Superintendent, etc.

May be seen in practical operation on Main street, between Howard and Folsom, San Francisco.

This Machinery has been adopted by nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

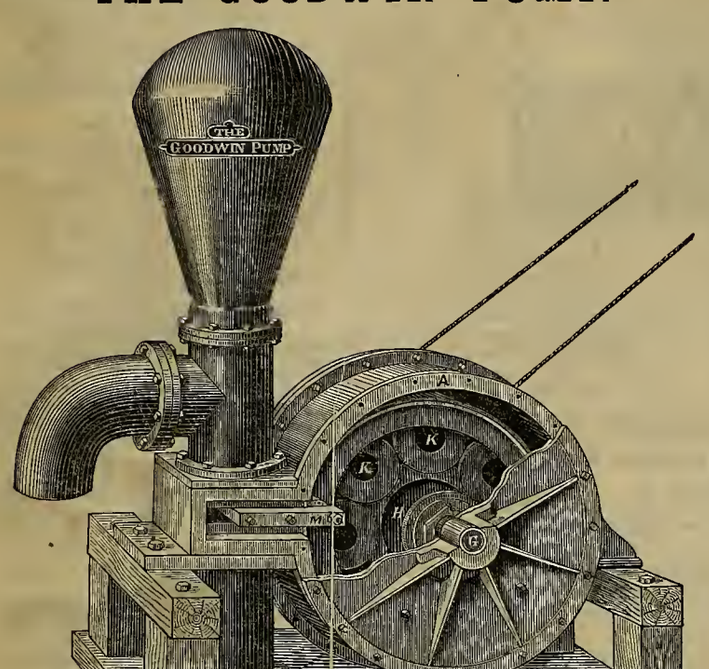
THE GOODWIN PUMP.



This Pump, which was awarded the PREMIUM at the last State Fair, where a large number of Pumps were exhibited, is the CHEAPEST, MOST EFFICIENT and DURABLE PUMP now manufactured.

We are rapidly increasing our Patterns and extending our facilities for manufacturing, but have not yet been able to fully supply the demand. As our Pump has no valves, it is the best Pump for mines where water containing sand or sediment, or where but liquids have to be pumped.

It is Unsurpassed for Hydraulic Mining,

And will throw a stream of from two to six hundred inches of water with a force equal to a fall of two hundred and fifty feet. It is peculiarly adapted to windmills for irrigating, or domestic purposes, and is equally as efficient and noiseless at a high or low speed, the water raised being in the ratio of its revolutions. Our large irrigating Pumps will throw twenty thousand gallons per minute.

BLAKE'S PATENT STEAM PUMP.

SALEM, Oregon, January 16th, 1872.

MESSRS. TREADWELL & CO., San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump (20—12—24), our company purchased of you, we would say in all sincerity that the Pump *has exceeded our expectations*. It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is *simple, durable*, and *perfect* in its construction. We have found it entirely satisfactory, and just the Pump in every respect needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

All sizes, for Mining, Tank and other purposes, for sale at TREADWELL & CO.'S Machinery Depot, San Francisco, where may be seen the largest stock of Mining, Mechanical and Mill, and Agricultural Machinery, *Portable and Hoisting Engines, Steam Pumps, Hardware*, etc., to be found in the country. 8v25eow-hp

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

SAN FRANCISCO, SATURDAY, OCTOBER 26, 1872.

VOLUME XXV. Number 17.

Sewell's Snow Plow.

The machine shown in the accompanying cnt is the invention of Chief Engineer George Sewell, of the United States Navy, and is designed for clearing railroad tracks from heavy snows. The advantage of an apparatus which will accomplish this ohject snccessfully is sufficiently apparent to require no explanation. It is nnderstood that this one will be practically and thoroughly tested this winter hy some of the railroad companies, and if it justifies in practice all that it promises to perform, there will he left no excuse for serious detention resulting from snow ohstruction on the road across the continent or elsewhere. The *American Artisan* describes this invention as follows:

The machine can carry its own motive power, or it can be loaded to cause sufficient traction to drive the snow-removing machinery, the latter being connected by suitable gearing to the wheels of the truck of the machine, and the whole heing controlled by a powerful locomotive, as shown in the engraving. The wheels of the truck are connected by rods, as shown, so that the tractive power of all is obtained. If deemed necessary, the locomotive can have one of the machines at each end.

At first glance, it might be thought that this machine would be inoperative in deep cuts with high hanks, but under such circumstances it would only be necessary to go through the cut with the machine and throw the snow on the opposite track, then to take that track with the machine, pick the snow up, aud deliver it into empty cars prepared for that purpose. Mr. Sewell has desigued a car for this special purpose, which is also adapted to clear out cuts where there is but a single track. This snow-digger is particularly commended to the officers and directors of the Union and Central Pacific railroad companies. Snow fences, although affording partial protection from drifts, are liable to destruction from fire and the elements; and should they escape combustion and tornadoes, they must inevitahly in a short time succumh to natnral decay, and their restoration wonld involve enormous expense. We think it certain that an ample supply of these machines could be maintained at less cost than the fences, while it would render the latter unnecessary, and enable the road to he kept open at all times.

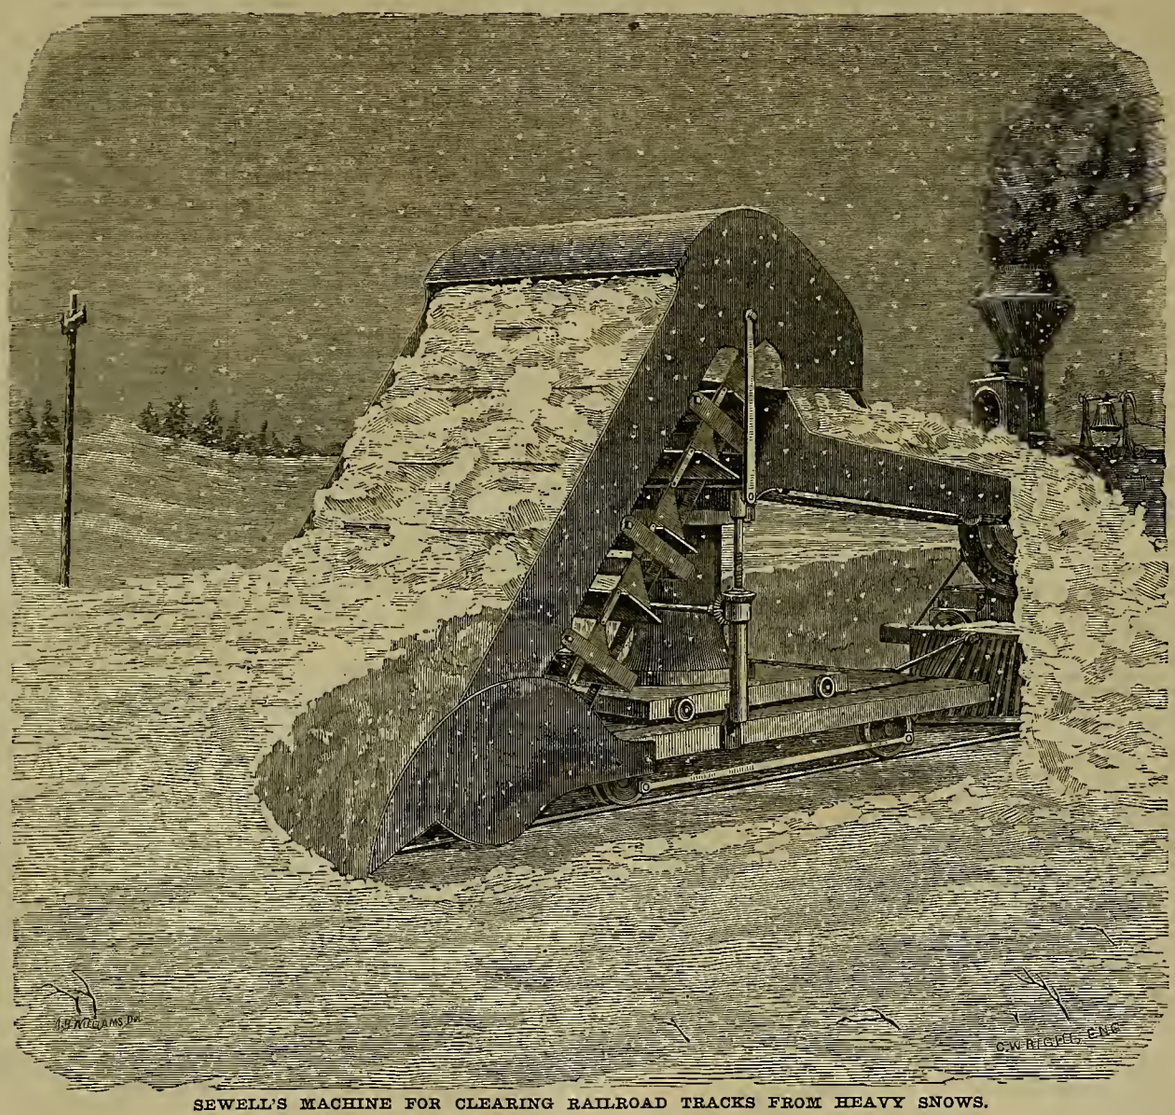
Referring to the engravings, it will be seen that the machine consists of an endless chain of buckets or elevators, embracing the whole width of the road bed, picking up the snow and delivering it to a chute, the bottom of which consists of an endless traveling belt or carrier supported on a series of rollers, which carrier constantly discharges the snow on the sides of the road, and at any desired distance fron the track, depending on the length of the chute. The belt is driven hy absolute power derived from the truck wheels. The chute is arranged to deliver the snow at either side, as may be desired; also, to be turned into line with the road when necessary, or to be raised or lowered if required by the exigencies of the occasion.

The elevator is also arranged to be lowered in passing under bridges. A frame is snspended nnder the elevator to prevent sagging of the chain and buckets. A scraper placed just forward of, and at the lower part of, the elevator, is designed more particularly for clearing ice from the rails in some of the mountainous portions of the Union and Central Pacific railroads. The cutting edges of this scraper are so arranged that irregularities met with at the joints of the rails will not obstrnct its operations.

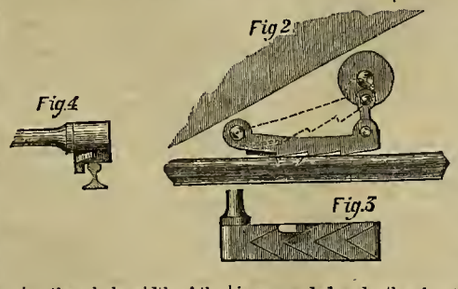
The use of the tooth projecting below the rail, as seen in Figs. 3 and 4, is to open a channel in the ice for the flange of the wheels. This also is shaped so that irregularities at the joints of the rails will not obstruct its passage. When not required, it can he thrown up out of the way, as shown by the dotted ontline.

During the ohstruction of the Union and Central Pacific roads, the Pacific Mail Steamship Company and the Panama Railroad Company reaped a rich harvest, and these companies are now making extensive preparations to do the same thing during the coming winter, feeling that neither freight nor passengers will again take the risk of a similar detention. It is fair to suppose that the officers of the two great roads named are awake to the necessity of secnring this traffic, and will eagerly embrace any plan that offers a reasonable prospect of relieving them from their embarrassment.

Any further information concerning this machine can he procured from Mr. Geo. Sewell, Brooklyn, N. Y.



SEWELL'S MACHINE FOR CLEARING RAILROAD TRACKS FROM HEAVY SNOWS.



Auburn Mine.—A very rich strike is reported in the Auburn mine, Rock Creek, Placer County. It is "specimen ore," from a pay streak 15 to 20 inches thick, in a ledge five feet in width and is said to run all the way from $3,000 to $10,000 per ton. The *Stars and Stripes* thinks it is one of the finest and most reliable ore developments ever made in quartz mining in Placer County, and will have a beneficial effect on the business prospects of the town also.

Coal.—It is said that parties have arrived in Pioche from the coal and iron mines of Kannarra, Utah, and have arranged to supply that market with coal from the latter place.

CORRESPONDENCE.

Tunneling in Eureka District, Nevada.

[Written for the PRESS.]

Since the new encouragement given to this branch of mining, by the Act of Congress of May 11th, 1872, and the protection thereby afforded to owners of tunnel claims, an impetus has been commnnicated to enterprises of this character which is very gratifying. Very few had entered npon the business of prospecting by this more economical method, the rnnning of adits being limited to those wbo found them necessary in the course of development of their mining property. Now, however, ground is being opened by tunnels and cross-drifts throngbout the district; some upon locations under the provisions of the new mining law, and others for the pnrpose of better development of old claims. The newest deserve our notice first, on account of the operation of the broad and liberal provisions of the act governing their location and working. The first location was made on the 18th of Msy—only seven days after tbe approvsl of the law by the President—by J. H. H. Williams and O. F. Griffin of Ssn Francisco, and Dr. L. C. McKinney of Eureka, and called tbe

Prospect Mountain Tunnel.

This level is designed to penetrate the central portion of Prospect Hill, commencing near its base and continuing a straight course entirely tbrough the monntsin, a distsnce, by actusl survey, of 2,700 feet. It will tap several well known mines, and is expected to reveal msny hidden veins beneath the surface, wbich would otherwise never be discovered. Among the nnmber of mines already being opened, as well ae those wbicb have been more or less prospected heretofore, which this tunnel will intersect, are the Enterprise, Hamburg and Cadiz, belonging to Dr. McKenney, the Morris, owned by Smith; Dunn & Smith; the Whippoorwill, owned by Maurice Wakeman, "French Joe" and Scribner; the Dolphin, Oromoso, Diamond, Eclipse and Mayflower, owned by Cole & Bridge, and the Slow and Sure belonging to your correspondent. The Morris and the Whippoorwill are mines of proved value, and were very near being sold this past summer, for $12,000 each. So also are the Oromoso and the Hambnrg.

The tunnel is now in 87 feet, and is being driven through very hard blne limestone. The extreme npper portion of a well defined vein of ore bearing qnartz was crossed at the beginning of the open cut at the mouth of the tunnel, whicb vein the owners of the tunnel right propose to prospect at a futnre time. The first hundred feet is nnder contract at eight dollars per foot, the workmen finding everytbing wherewith to perform the work.

Ruby Hill Tunnsl

Is being prosecuted by a company incorporated nnder the laws of the State of Nevada, and the stock is principally owned by tbe inhabitants of this district. Dr. L. C. McKenney, is President and manager, and Col. Sam. Bell, Secretary. Fourteen thousand shares at the minimum price of fifty cents per share having been offered in the market by the Trusteee, for the purpose of raising a working capital. Enough stock bas already been sold to enable them to prosecute the work, and the level bas now been run a distance of 235 fcet, crossing in its course one "blind lode," at 200 feet from the mouth of the tunnel. The ground of the company embraces 600 feet across the the hill, by 800 feet in length. It adjoins the property of the Eureka Consolidated Co., on the north side of the hill, a little past the summit. Tbe Ruby Hill Tunnel Co., intend to run tbeir drift to the point of junction with the claims of the Consolidated Co., "pay, or no pay." Several surface claims showing good prospects were purchased by the Ruby Hill Tunnel Co., on the line of their tunnel, previous to commencing work. Ruby Hill Tunnel was located on tbe 18th of May, seven days after the passage of the new mining law, and in accordance with its provisions.

Diamond Tunnel

Was located in May last, for the pnrpose mainly of prospecting the mine of the same name on Prospect Hill. Only a commencement has been made however, the owner having too much work on hand at present, in developing other mining property.

Safe Tunnel

Is located near the foot of New York Cañon, upon a mine of the same name, now ownod by Dr. McKenney and A. Skillman. The level has been driven abont 20 feet in blue clay and quartz, and a winze sunk following the lead, which snddenly dips at that point. The ore already mined from tbis location is of good grade, assaying from $80 to $300 and upwards per ton. From the bottom of the winze, an incline has been started in hard limestone, that being the formation in which the ore is now found. Work has however, been snspended here for the present.

General Lee Tunnel.

This forms a part of the works of Adams Hill Consolidated Co., of which A. M. Ellsworth is Superintendent. The level was run upon the General Lee mine by the original owners, and bss been since continued by the present company, who hsve also been engaged in sinking shsfts and running drifts from the same, to still fnrther prospect tbe mine.

Elise Tunnel.

Tbis work was prosecnted more than a yesr ago, and was performed by Adam Hsll and others, to the extent of 300 feet, for the purpose of striking the Elise and Sterling ledges, which crop out at tbe surface. The tunnel traversed hard blue limestone for a distance of 200 feet when the ore made its appearsnce. At 260 feet tbe ore of the Elise was struck. Work wss snspended at 300 feet.

Lemon Tunnel.

The Lemon Mill and Mining Co., own the mine of the ssme name, upon which this level is being run to strike tbe ore at 360 feet from the surface. Tbe work is under contract to Cornish miners, and 381 feet have alresdy been finished. The distance to be run is probably about 130 feet.

Dunderbsrg Tunnel.

The Dunderberg mine belongs to the series owned by tbe new English company, incorporated under the name of Ruby Hill Consolidated Co., limited. Considerable work has been done through hard rock, at five dollsrs per foot, bnt tbe contractors became dissatisfied with the terms of their contract, and threw it np. The tools were furnished by tbe company.

Robertson Tunnel

Was driven about two years ago, near the head of New York Cañon, for the end of prospecting one of the numerons locations msde by George F. Brsgg and J. M. Robertson; bnt it is said that this and other mines belonging to the same parties are now awsiting a patent from the United States, which has been applied for by Geo. F. Bragg.

Hcme Tickel Tunnel,

On the mine of the ssme nsme, of which P. H. Smitb is Superintendent, has been driven 100 feet, to strike ore shown upon the surface. Tbe developments made by this tnnnel are of the most encouraging character. Prof. Clayton long ago reported favorably npon tbis mine, and appearances indicate a confirmation of his opinion.

Orange Tunnel.

Upon the Orange mine bave been found the most remarkable series of caves or chambers of ore, connected by "leaders," or small veins, which gradually enlarge as the chambers are approached. After working out one of these caves, the proprietors became convinced that a larger one must exist at no great depth below, and concluded to run an adit to meet it, instead of following the "leaders" to an indefinite length. A tunnel was commenced at a lower point on the mountain side, and a perpendicular shaft at a higher one, immediately over the last deposit found. The level was driven abead, and entered an immense chamber of ore, and the ehaft soon after reached the same deposit. The Orange is owned by Dr. J. H. Nesbit of Eureka.

Lawlon Tunnel.

This is one of the works of the Eureka Consolidated Co., upon the Bnckeye mine, and with the exception of the Richmond mine, has developed the largest body of ore of any in the district. Thousands of tons have been received at the furnaces of the company from this mine, and the supply still seems inexhaustible. The ore was first struck in this tunnel more than two years ago. The deposit was 154 feet in length, and of unascertained depth.

Giffin Tunnel.

This is the longest adit in the district, and was named in compliment to O. F. Giffin, President of the Star Consolidated Co., whose property it intersects. It is now 468 feet in length and is expected to tap a numerous group of ledges upon Freeman Hill belonging to the company. A "blind lode" has already been struck in tbis tunnel, at 400 feet from its mouth, and 150 feet from tbe surface. The work is under the superintendence of Dr. McKenny. The whole drift is as straight as a bee line, and the track is in perfect order. The ravines near this tunnel are shallow, and the arrangements for economizing space for a dump are admirable. The company own 24 locations by discovery and pnrchase, and among these are such mines as the Blue Star, Compromise, Unicorn, Star of the East, Sherwood, Lawton, Monongahela, Mattspan, Sentry, Elijah and Eastern Nevada.

Williams Tunnel

Also belongs to the Star Consolidated Co., and ie now in 242 feet on Freeman Hill. It is in the form of an L, the shape and situation of the hill compelling an indirect route in order to attain depth upon the mines. It will intersect and prospect the Unicorn, Compromise, Star of the East and Sherwood mines. The tunnel was named in compliment to J. H. H. Williams, one of the Trustees.

Fourth of July Tunnel,

On the mine of the same name, situated on Prospect Hill, belongs to Judges Williams and Hillyer, of this State, and to M. E. Gardner and the brothers Drieshach, of Carson City. John Driesbach is the Superintendent. An incline and perpendicular shaft reached a depth on the ledge of 160 feet, when the proprietors concluded to run a level to strike it at a depth of 300 feet. The drift is now in 175 feet tbrough very tough rock nearly the whole distance. Only eight dollars per foot is the contract price for this tunnel, and it is evident that the contractors must lose money. Tbe ore of tbis mine is abundant, and of high grade, and is associated throughont with silver-bearing blnish-white quartz. The earthy matter about the ledge consist of argillaceous iron, yellow ochre, srseniate and csrbonate of lead, and ferruginous sand. The mine is one of the few in this district in wbich the minerals are so associated. With the exception of the Slow and Sure, and the mines of the Star Consolidated and Adams Hill compsnies and one or two of the Ruby Hill Consolidsted, all others in this district are ochrsceons deposits, some of them of immense extent. Such are the Richmond, Buckeye, Excelsior, Laurel, Home Ticket, Valentine, Orange, Morris, Whippoorwill, Golden Gate, Oromoso, Diamond and a host of others. Well defined fissure veins of metal-bearing quartz are tbe exception, not the rule; although more or less of this mstrix, in a decomposed and br ken up condition is found in all these mines, associated with the oxides of iron.

Lord Byron Tunnel.

The mine of this name belongs to tbe series owned by the Ruby Hill Consolidsted Co., and is situated on Prospect Hill, immediately above tbe Valentine, also belonging to the ssme company. Tbe tunnel is being run to more completely develop the mine; bnt, owing to tbe sitnstion of the ground, will not strike the ledge at any great depth. The work was recently commenced, and bnt little progress has yet been made.

X Y Z Tunnel.

This level was run npon tbe mine of the ssme name, belonging to the South Eureka Mining Co., situated on Prospect Hill, adjoining the Fourth of July. It is abont 100 feet long, and a winze has been sunk at its termination to stnike the deposit below. Work has been suspended on tbe mine for some weeks past.

Laurel Tunnel.

Tbis tnnnel is run to prospect the Laurel and Echo mine, belonging to the Lemon Mill and Mining Co. Tbe distance run is now 70 feet, and when completed, the depth from the surface will be 600 feet.

Old Put Tunnel.

This work also belongs to the Lemon Mill & M. Co., is in 70 feet, and will strike tbe ore at a depth of 500 feet. All the mines of this Company contain good milling ore in fair paying quantities. Tbeir mines are all situated on Prospect Hill.

Tunnel and Shaft Compared.

It may safely be predicated of every mine, that it is not and cannot be properly opened without tunnelling. Even where the prospecting has been by perpendicular sbaft, the miner finds himself necessitated to resort either to drifting at different levels to tbe ssme, or to go outside at a lower point on the monntain side, and drive an adit for his ledge from thence.

Now, whether it has been satisfactorily ascertained or not, by the prospector, that he has a valuable mine, the most economical method, either of testing its value or of working it permanently, is by tunneling. Tbe work by drift can be performed for about one-fonrth of the cost of sinking a shaft, for any distance. Wben, therefore, the indications are sufficiently encoursging npon the surface, the former method of prospecting should alwaye have tbe preference, wherever practicable.

The New Mining Law.

In this view of tbe subject, the new National Mining Law gives all the encouragement needed for the prosecntion of tnnneling for prospecting even for hidden lodes. Some obscurity, however, still lurks in the provisions of the section regulating this matter, which tbe instructions of Commissioner Drnmmond fail to enlighten. It is yet an nncertain conclnsion, whether the locator of a tnnnel-right can claim exclusive ownership of all the surface ground for 750 feet on each side of his tnnnel face, and so on throughout his whole line, and prevent all prospecting over the whole extent of snch an immense piece of property; or whether his 750 feet is to be confined to the line of snch lodes as he may discover in his tunnel, or may have located on its line previously. Tunnel-right owners now claim to exclnde all parties from running tunnels on either side of them, for a distance of 750 feet, and on a line 3,000 feet in length. Wbat the Commissioner will say to this we do not know; that he shonld say something is important and imperative. Otherwise, the tunnel-right may prove oppresive to the prospector, and discourage all attempts at discovery, except by large capitalists. If a tunnel location gives simply the right to rnn a level on a certain line for a distance of 3,000 feet, and allows exclusive ownership of all lodes found in its course, for a length of 1,500 feet, the matter is easily nnderstood, and all action as easily accommodated to snch a regulation. But if snch regulation may inclnde a whole mountain, from base to apex, and from center to circumference, the business of prospecting mnst be giveu np by all persons without means, whicb will be eqnivalent to its being given up altogether; for capitalists will not go personally into desert regions, seeking to make mineral discoveries, at tbe cost of innumerable personal discomforts.

P. S.—Since writing the above, I have been shown the recent explanation of the Commissioner, of date Sept. 20th, on the points alluded to; and it effectually disposes of all the qnestions raised concerning the rights of tunnel locators. Persevering and plodding prospectors will now proceed in easier sboss. W. H. M.

Prospecting and Mining—Copper Veins.

EDITORS PRESS:—In nearly every mining district may be seen msny fruitless attempts, and tens of thousands of dollsrs expended in search of mineral bearing veins, far from the proximity of any such. The presence of a light stain of mineral has deluded many; notwithstsnding it is generally known tbst an insignificant amount of mineral, especislly copper and iron, will prodnce oxides which will extend to a considerable distance from its origin. I have seen formations literally stained with faint shades of different minerals in localities wbere I was qnite sanguine neither of tbe minersls existed to any remunerative amount; for water, like veins, traverses strata after strsta, formstion after formation, finding its way tbrough veins of minerals, tsking tberefrom, in solntion, some of the minerals through wbich it passes, and consequently coloring all the interstices of the rock in its course, which coloring, however, will decrease in distsnce according to the qnsntity of water pssing through, and the compsctness of the strstification. If the formstion be auriferons, faint oxidation may be observed for miles. Tberefore it is obvions tbat any one intending to prospect at surface, or at a certain depth, should not tbink of investing capital with merely a slight mineral stained rock in view, but rather wait until be has trsced the stain to its deepest hue.

Nearly two years since, when passing a mine in one of tbe Territories, a gentleman requested me to descend it, which I did to a depth of 250 feet. He sbowed me some of the mineral, which he said csme from the bottom, that looked so snrface like tbst I almost doubted tbe assertion; bnt when descending I observed all the way down a small stain produced by chemical action, being the very identical composition presented meat the surface, while on either side pebbles (very round) indicated the formation to be a slide, wbich convinced me that even at that depth we were not at the surface of the main vein—it being still beneath—which was verified in the depth (25 feet) subseqnently reached by getting into the limestone, where a diminntive vein of argentiferous galena existed.

On the other hand many a one possessing land with unmistakable signs of mineral beneath, becanse of inexperience, bas sold for a trifle and in after years lamented their "luck," when the coffers underneath were nnsealed and the treasnres of tbeir once possession were being taken out year after year without signs of exhaustion. This is of no rare occurrence, but has been and will be frequently repeated. Such facts should stimulate us to appreciate all which are discovered, and compare carefully every new discovery with otbers previously known.

As there are many copper mines tbronghout the State recently pnt in operation, by reason of tbe present great demand for copper, a few suggestions, in relation to working such mines, may be acceptable. As mentioned heretofore I find that copper veins at snrface presenting a bnrnt appearance, disseminated throughout with a little copper ore, are indicative of a greater amount of mineral beneath than tbose yielding yellow sulpburetts, without evincing any snch action. This is wortby of observation. Some people are of the opinion tbat copper veins "never die out." Notwithstanding these assertions, however, sucb veins, like otbers, do often disappear when they encounter different stratifications, etc.

In the foothills of the Sierras, in the southern counties, the veins are embedded in the clay slate formation, which is very congenial to copper ore; nevertbeless, they are peculiar and tbeir characteristics different from copper veins generally. At the surface they present gossan, soon carbonates of copper, continuing several feet in depth, and gradually yielding to black oxides, or yellow sulphuretts. But in depth the yellow sulphuretts become tbickly impregnated with iron pyrites, causing considerable decrease in the percentage of the ores. These iron pyrites *there*, are the finale of copper ore, instead of being *vice versa*, as is generally the case in other locations. Iron pyrites in some districts are considered indicative of the proximity of a body of copper ore, whereas in this region it is indicative of its exhaustion—itself "dying out."

In visiting the copper mines of this coast, one is surprised to see so much copper ore wasted—thrown away as refuse because of the lack of machinery applicable for its separation. The plan of roasting, which is generally adhered to, results in a loss of twenty-five per cent. of tbe copper ore so worked. By the application of different kinds of machinery, ores as low as three per cent. of copper in Cornwall and Devon, England, remunerate the proprietors. Then why not apply such here? The ores on this coast far surpass tbose of England for richness. T. S.

A COMPANY has been formed for building a csnal for irrigating purposes, and a narrow-guage railroad from Carson Valley, by way of Silver Mountain, to Oakland.

THE product of the Groin mine, from sixteen stamps, has averaged $20,000 per month for some time past.

A BAG mannfacturing company is being formed in Marysville, with a capital of $50,000.

Scientific Progress.

Soluble Glass as a Detergent.

MM. Baerle & Co., of Worms, have pnblished the following on the employment of soluhle glass as a detergent: The employment of soluhle glasa in tho washing of wool is an important fact in this industry. The treatment is so simplo and so ecouomio that it is only necessary to make an experiment to recognize its advantages. Take 40 parts of water, at the teuperature of 50° to 57° Cent., and one part of solnhle glass; plange the wool into the mixture, stirring it about for a few minutes by hand, then riuse it in cold or tepid water, and it will be fonnd completely white and void of smell. The wool, after this operation, remains perfectly soft, and loses none of its qualities, even when left for several days in the solution of the silicate, and being washed in hot water. Sheep may also bo washed with the same preparation, care heing taken to cover tbo eyes of tha animals with a handage, to perform the washing with the solution iustantaneously, and to remove the surplus with tepid water. In the caso of combed wool, the wool shonld be first steeped in the solntion above given, and afterwards in another hath composed of 80 parts of water at 37° Cent., and one part of solnble glass. In this way the effect is excellent and economic, without the employment of soap or soda, and the wool is rendered at least equally white, clean, and soft as by other methods. Soluhle glass may also be used advantageously for domestic washing. A bath mnst be prepared over night, with 20 to 30 parts of water, at 50° to 57° Cent., and of one part of nentral soluhle glass; the linen is plunged into this hath and left there till the following morning, when, after the bath has heen reheated with additional hot water, it is to he worked with a wooden stamper. The aspect of the solntion tells when tho linen is nearly cleansed, when the former is to be drawn off, and the linen drained. The operation is then completed by rinsing with a little soap; bnt it is well to pass the linen again through a weak solntion, consisting of one part of soluhle glass to 50 parts of water at 45° to 50° Cent., and then to rinse it ont in pure water.

Noctilucine.—This name Dr. T. L. Phipson has given to a peculiar organic substance which, he says, causes the phosphorescent light in fishes and other (dead and living) creatnres; also in vegetahle tissne. It is, at the ordinary summer temperature [we condense from the *Chemical News*] white, almost liquid, slightly odoriferous, and contains considerable water; is insoluble in alcohol and ether, slightly soluble in water, and easily soluhle in nitric or sulphnric acid. So long as it is moist it ahsorbs oxygen and evolves carhonic acid; when left to itself it dries np slowly to thin, ahining, translncent films. When recently produced it is highly phosphorescent, oxidizing and thns producing light. It is secreted in phosphorescent auimals by a special organ and appears to he nsed in prodncing light nearly as fast as it is formed. It is also produced, under certain conditions of temperature and moisture, in dead animal matter of various descriptions, (pork, beef, fish, blood, etc.,) and occasionally in wine Its secretion in the higher phosphorescent animals, as the glowworm and firefly, is dependent to a certain extent npon the nervous system of these insects, hence they have the facnlty, apparently, of shutting off their light at will. In this case the secretion is stopped for the time. A certain qnantity of noctilucine exists in the eggs of the glowworm, which shine for some time after they have been deposited.

The Bottom of the Mediterranean Sea a Desert.—Dr. Carpenter read an interesting paper before the late meeting of the British Association of Science on the temperature and other physical conditions of inland seas, especially considered in refereuce to geology. He stated his belief that a uniform glacial temperature would be fonnd to prevail even in equatorial seas, if they went deep enough, and this cold could only he understood on the theory that there was a movemcnt of cold water from the Poles along the bottom of the sea. He showed the inland character of the Mediterranean sea, and that the cold water of the Atlantic conld not flow into it on account of the ridge which rose up and shut them off. Hence there was no circulation, and a good deal of finely divided mud, which choked marine life and rendered the bottom of the Mediterranean a desert. He next referred to the temperature of the Red Sea, and showed that at a great depth there was a winter temperature of over seventy degrees. Coral reefs could not grow at greater depth than twenty-eight fathoms, and this, he thought, was due to the cold water below.

Rapid Telegraphino.—According to the *Journal of Telegraphy* the average actual time of transmitting messages from New York to London, for one week, was 13 minutes 59¼ seconds. This includes the long press and government dispatches. Every message haa to he written four times. On one day the average time was only six minntes thirty-five seconds. The shortest average time was one minute four seconds. This is wonderful, yet steps are being taken to introduce improved inatruments by which the time can be still further reduced.

An Impressive Scene.

A singular scene was witnessed in the Paris Academie des Sciences at a sitting which occurred during the siege. Mr. Egger, Professor of Greek at the Sorbonno and member of the Academie des Belle Lettres, availed himself of the privilege granted to the members of different academies, and presented a long dissertation on a papyrus found in 1866, which gave a deal of information on the state of ancient Egyptian civilization. It related chiefly to the prices of articles used in those times. The bursting of the shells and the thunder of French artillery was distinctly heard during the reading.

It was an impressive scene, to see these learned men discussing a civilization which was swept from the earth so many centuries ago, at a time when their own country was threatened hy ruin not less awful and perhaps more disgraceful. The members of the Academie continued their weekly meetings with perfect regularity throughout the bombardment. While everything else was turned upside down, while a dynasty was passing away, while sons and brothers were perishing around them, an enemy at their gates, want within their walls, and missiles of war threatening themselves and their household gods, these men continued their usual studies.

We are reminded of Archimedes at the siege of Syracuse, save that there we have but one man, while here it is a large body of the intellectual flower of the country. Some of the more active of the members are men who have attained that philosophic calm which not even the terrora of war can dispel, nothing diverts them from the even tenor of their way.—*Ex.*

The Work Done by a Human Heart.—The total daily work done by a human heart is equivalent to 124,208 tons lifted one foot. The daily labor of a workman, deduced from long-continued observations of various kinds of labor, is found to be equal to 3,540 tons lifted through one foot during the ten hours. This is less than three times the work doue hy a single heart, heating day and night for twenty-four honrs. In a boat race, it is calculated that fifteen foot-pounds of work are performed hy each ounce of muscle during each minute of the rowing. No muscular labor that man can undertake is more severe than this; and yet this labor is only three-fourths of that which is exerted day and night during life by each of our hearts. If the heart should expend its entire force in lifting its own weight vertically, it could raise that weight 19,754 feet in an hour. An active pedestrian can climb from Zermatt to the top of Monte Rosa, 9,000 feet, in an hour; or he can lift his own body at the rate of 1,000 feet in an hour; which is only one-twentieth part the energy of the heart. The heart's energy equals one-third of the total daily force of the muscles of a strong man; it exceeds by one-third the lahor of the muscles in a boat race, estimated by equal weights of muscle; and it is twenty times the force of all the muscles used in climhing, and eight times the force of the most powerful engine of the same size yet invented by man.—*Boston Journal of Chemistry.*

The *American Chemist* says a very elahorate series of experiments was recently made in New York to test the relative value of different lubricators. The experiments were continued during a period of fonrteen months. The following were the general resnlts and inferences: The consumption of oil varies with its temperature when applied. Winter sperm sustained the heaviest pressure, and was taken as the initial of comparison for all others, and their percentage of lubricating value determined hy it. The tests of mineral oils and mixtures of animal and fish-oils with them would not sustain an equal pressure with the sperm, when equal qnantities of the oil were applied, without rapidly increasing the temperature of the journals, and producing an abrasion of their surfaces. When the pressure on the bearings was made eqnal with winter sperm, it required from 100 per cont. to 400 per cent. increase of oil, to keep the temperature of the journals helow 100 deg. Fah. Experiments were mado at varied velocities with the same oils. The results proved that as the velocity was reduced the pressure could be increased, and the relative consumption of oil, applied at eqnal temperatures, was decreased in almost equal ratio.

The property of glycerine to preserve leather has been known for a long time; it is now proposed to employ it in tanning, to increase the elasticity and resistance of the leather. This system of tanuing is particularly adapted to straps and belts of machinery, and it keeps them from drying and cracking. It is only necessary to immerse the leather, tanned in the usual manner, in a hath of glycerine, and to leave it for several weeks, when the pores will be impregnated with the greasy substance, and the leather will he found to be much more elastic and tenacious.

Coloration of Glass by Sunlight.—Mr. Thomas Gaffield, of Boston, Mass., has found by careful observation that nearly every kind of glass, especially that colored with manganese, is liable to a change of color hy the action of sunlight, and that the glass could be restored to its original color hy the action of heat. He holds that the glass in our old cathedral windows does not now preaent its original colors; but that they can be brought hack again hy heat.

Mechanical Progress.

An Experiment With Paper Car Wheels.—The Springfield *Republican* says the Connecticut River railroad company is about introducing for trial, a set of paper car wheels nnder the forward truck of one of its engines. These wheels have heen known to car-builders for some time, hnt the demand for them has heen moderate on account of their cost, notwithstanding the universally-admitted fact that they are safe and easy going. The wheels are manufactured hy hringing a pressure of 350 tons npon sheets of common straw paper, which forces them into a compact mass, which is then turned perfectly round and the hnh forced into a hole in the center, this requiring a pressure of 25 tons weight. The tire is of steel and has a one qnarter inch hevel upon its inner edge, thus allowing the paper felling to be forced in, 250 tons pressure being required in the process. Two iron plates, one upon each side of the paper, are holted together, which prevents the possibility of the fillings coming out. The tire rests npon the paper only and partakes of its elasticity in consequence. Although these wheels are much more expensive than those in common use, the patentee claims that they are cheaper in the end, as they wear longer, injure the tracks less, and run with less noise than wheels of any other pattern.

Australian Woods.—Many of the Australian woods exhibit a peculiar beanty of structure, which adapts them for small furniture and turnery uses. Some are highly fragrant, and retain their agreeable odor for a considerable period of time; this renders them additionally pleasant and acceptable in the form of ornamental articles for the boudoir and drawing room. The scented myall (*Acacia homalopyhlla*) is a very hard and heavy wood, having an intense and delightfnl smell of violets. It has a dark and beautiful "hardening" which makes it applicahle to numerous purposes of the cabinetmaker and the wood turner, and for an infinite variety of minor uses. It rarely exceeds a foot in diameter, bnt has been used as veneers.

This tree is common in many parts of Australia; since the London Exhihition of 1862, when caskets and other articles were shown from Queensland, and the remarkahle property it possessed became generally known to Enropean manufacturers, the wood has been in request for making glove, handkerchief, and other fancy boxes. As long as it remains unpolished it preserves this peculiar fragrance of violets, which does not occur with such perfectiou in any other known snbstance.—*Art Journal.*

An official trial was made at No. 2 huilding slip at the Devonport Dock-yard, on Thursday, the 12th ult., of an invention which consists of interposing between two thicknesses of wood an elastic preparation which, when fired at and perforated by a bullet, would instantly close and become perfectly watertight, rendering a vessel so fitted unsinkable. A wooden box 3 feet long hy 10 inches wide, and three-quarters of an inch in thickness, and having on one side an eighth of an inch iron plate screwed on to the wood, was treated with the preparation and fired at with a rifle at 23 yards' range. Ten shots were fired, the hullet each time going completely through the wood. With eight shots the aperture only partially closed, and on the hox being immersed admitted water more or less freely. Two shots fired point blank were successful, closing immediately, and were practically water-tight. The inventors claim that the perforations made by the largest projectile would close as readily as a hullet hole. The experiments cannot be considered satisfactory.

A new lamp has heen invented hy a French chemist which is intended to be used at sea, and is peculiarly adapted to the purpose hecause it cannot be extinguished hy wiud or water. It consists of a cylindrical vessel of tin, with a conical point, provided below with a tube six inches in length. The vessel is filled entirely with fragments of phosphide of calcium, and the tube soldered up air-tight, so that tho preparation can he kept many years without change. When the lamp is to he used the tip of the cone is to he cut off, and an opening made at the end of the narrow tube referred to, and the lamp inserted in a wooden float and thrown into the water. The water penetrates through the lower end of the tube, and comes into contact with the phosphide of calcinm, and is decomposed with the formation of phosphuretted hydrogen gas, which is developed in great quantity, and which, escaping through the open tube of the cone, becomes ignited and hurns in contact with the atmospheric air.

Improved Economy in Iron Manufacture.—The managers of the Cincinnati Railway Iron works, in which nine of Dank's puddling machines have been put in operation, have effected an important economy in working iron by melting the pigs in a cupola, and running the metal directly into the puddling machine. By this means, it is claimed a saving of one-half is secured in the time which would be required were the iron melted in the furnace attached to the puddler, and it is possible to dispose of two heats per hour in each furnace, running 500 lb. hlooms. A thorough acquaintance with the machine shows that light iron can thus be made ahout as readily as rails.

The Work of the Telegraph.—The new Society of Telegraph Engineers in London have commenced puhlishing a journal of the progress of telegraphy. The first number contains an interesting paper on automatic telegraphs. Without the automatic apparatus it would be impossible to perform all the work. From the central station in London as many as 400,000 words aro transmitted in a single night, and through five or six stations simultaneously, whereby it happens that the qnantity of matter telegraphed is eqnal to a thousand columns of the *Times!* In the working of the telegraph some curious facts have been observed. A message sent through land-lines and an undersea cable travels more qnickly towards the place which has the longer land-line than in the opposite direction. On wires stretched east and west the speed is decreased ahout noon, a fact due, it is thonght, to the diurnal variation in earth currents.

The following is the new process employed for making slate assume the appearance of marble, for decoratiug iuteriors. After heing properly out and trimmed, it is scoured with pumice stone, then rubhed with powdered pumice stone, and polished with felt. It is now ready to be transformed into marble. The slabs, having been painted with the gronnd-work color, are ready to dip. A vat containing water mixed with ox gali, on which the colors are floated, is at hand. A brueh is dipped in the colors and spriukled on the surface, then the water is fanned with a palm leaf and the hrush drawn through several times. The mixed paint spreads on the surface of the water like veining in marble, and the slab is then lowered until it touches the surface, when the floating color adheres to it; it is then pnt to dry. After the application of colors, aundry bakings and polishings finish the work. Thia marbleized slate is quite elegant, possessing sixteen times the strength of marble and scarcely distinguishahle from it.

Donkersley's Puddler.—Experiments with this puddler, in one of the works at Marquette, according to the *Mining Journal*, seem to promise snccess. A very fair quality of steel has been made in this pnddler, with metal direct from the hlast furnace, but not in such quantity as would seem to justify a claim that steel could he made with it at a profit. Aud a very fine grained, firm, tough quality of wrought iron has heen turned out of it, which seemed to require but little manipulation under the hammer to form it into blooms or hammered bar.

The enginos of the Cunard steamer Scotia, are of 5,000 horse-power, 100-inch cylinders, and 12-feet stroke; she burns 160 tons per day, and requires 1,900 tons for an Atlantic voyage. The new style of compound engines effects a saving of fifty per cent. in fuel; the owners of the Scotia, therefore, by suhstitnting the new style of engines for the old, would save 1,000 tons of coal per voyage, and add 1,000 tons to the cargo capacity of the vessel.

Another Monster Ship.—It is said that specifications are at present in the hands of several Clyde shipbuilders, for a vessel to be built for the National Steamship Company, of dimensions only second to the Great Eastern. Her length is to he 576 feet over all, and she is to be fifty feet heam and thirty-five feet in depth. It is expected that the great steamship will make the voyage from Liverpool to New York in seven days.

A new street-car has been constructed and put in operation hetween Ilion and Franklin, New York, propelled by steam, the engino occupying no more space than an ordinary cooking-stove, can he stopped when running six miles an hour in eight feet, uses one ton of coal to a thousand miles, and on a trial trip recently was propelled fifteen milea an hour.

In the course of a month or two there will he placed a line of very large and powerful steam tugs at both the entrances to the Straits of Magellan for the purpose of towing vessels through the straits, thus doing away with the difficult and often dangerous voyage round Cape Horn. The estimated cost of so towing a vessel is £200 to £250.

The result of experience with iron as a material for ship-building has not heen favorahle to it as a substitute for wood. Of the forty-two Atlantic steamers lost during the past thirty years, thirty-eight were of iron and only four of wood. Amongst coasting vessels an equally proportionate loss can be shown.

The Wisconsin Legislature did a wise thing dnring its last session in providing that all doors for ingress and egress to and from public school houses and other public buildings should open outwardly. It is to he hoped that similar action may be taken by the legislatures of other States during the coming winter sessions.

Staining Veneers.—Difficulty is often experienced in getting the coloring matter to penetrate the wood sufficiently. This may be obviated hy soaking the wood for 24 hours in a solution of caustic potash, and finally hoiling them for half an hour.

In the manufacture of percussion caps, if the fulminate of mercury is granulated and mixed in vacuo, explosions will not take place. It is also stated that a mixture of cyanuret of copper and chlorate of potassa can he suhstituted for the fulminate.

It is asserted that the diagonal-jointed hoilers are one-third stronger than those with longitudinal joints.

NOTE.—†—California. *—Washoe. ‡White Pine. §—Ely Distric. ¶Bureka Distriot. ‖—Idaho. ¡—Nearly.†—Over.

S. F. Stock and Exchange Board.

THURSDAY, October 24th, 1872.

Stocks have only besn in modsrate demand this wssk and salss have as a gsneral thing been light. Scarcity of money has made scarcity of sales and ths volume of transactions has bssn lighter than for some time. Ths large number of assessments, both last month and this, exsrciss considerable influence on the markst. These assessmsnts occur more freqnently at this time of the ysar than any other, as preparations are made for winter. Moreover an unusual number of mines are now in courss of dsvelopment than herstofore. We shall soon begin to gst back the money in use for moving the crops, and may then look for an increase of intsrest in mining matters. The burning of the tunnel on the Virginia and Truckee Railroad will have a bad effect on the Washoe mines since it cuts of suppliss off timbsr and wood, and prevents shipmsnts of ores and supplies. The damage will be rspaired, howsver, as soon as possible.

On Friday, the markst was very dull with few salss. Saturday, it was no better. Mouday the market was unusually flat, and although prices were firm thsre was no businss done. Tuesday there was a marksd improvement, and prices were generally higher. Wsdnesday, prices still continusd to rise, although there was no material increase in business. To-day, stocks were in light dsmand, but prices were gsnsrally firm.

BELCHER.—A letter of the 19th says work has been rssumsd on the incline, and the ors chute on the 1100-foot lsvsl is completed, and as soon as the drift can be clsarsd and about 100 feet of track put down, evsrything will be in readinsss to hoist ore through their own shaft.

CROWN POINT.—Air connection with the east winze has been made and the 1300-foot level is now supplied with pure air. Ore looks well and assays $193.

SAVAGE.—During wesk ending Oct. 19, 1,012 tons of ore assaying $27.97 wsre extractsd; 997 tons wsre sent to mill and 400 tons rsmain on dump.

RAYMOND & ELY.—On the 18th, $32,129 were shipped and on the 21st $34,608; previous shipments in October were $166,664, making a total of $201,272; equal to $10,593.26 per day. Ths mills ars all running and the mine looks well.

PHŒNIX.—On ths 16th, 10 tons of bullion were shipped valusd at $4,991.70. Letter of ths 17th says that from Tussday at 6 P. M., to Wednesday, 6 P. M., the furnace turned out 21,878 pounds bullion averaging per ton, in gold and silver, $379.15—the bsst day's work ever done in the district with a single furnace. Shippsd on the 17th, 20,008 pounds bullion; value, $5,691.50. On the 18th 20,000 pounds of bullion were shipped, valued at $6,881.60. On the 20th and 21st $10,888,20 was shippsd.

EUREKA.—A clean up was made on ths 16th of six day's run with 15 stamps, which amountsd to 850 ounces of amalgam.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

M. & N. W. Co.—Monitor *Miner*, Oct. 12: Ths dam of the M. & N. W. is to bs thoroughly ovsrhauled and put in repair for winter.

Machinery for the hoisting works of Mr. Chalmers, to bs erected up Scaudinavian Cañon, arrived this wssk.

MACHINERY.—Alpine *Chronicle*, Oct. 12: Ths two hoisting works of ths Exchequsr and I X L mines will arrive to-day.

EXCHEQUER MILL.—The remodsling is progrsssing finely. The machinery arrived on Thursday.

CALAVERAS COUNTY.

ANGELS.—San Andreas *Citizen*, Oct. 19: The Big Mine is repairing the hoisting works and the pumps. In the meantime ths stamps are orushing ore for Doctor Hill. Work on the Stickler mine is progressing rapidly. The Co. will prosscute sinking of the shaft.

RAILROAD FLAT.—Mr. Sheldon, at the Wolverins, is busily sngagsd in putting in a large tank at ths 200 ft. level to drain the mine of surfacs water.

On ths Pstticoat they have stoppsd sinking, and started a level north and south from the shaft at a dspth of 450 ft. The Co. intend running the north level until they strike ths rich chimnsys known to exist some 800 ft. north of the present shaft.

At the Sandsrson, the work of sinking the shaft is being pnshed forward rapidly; a lot of sulphurets worked last week yielded $348 per ton.

MOSQUITO DIST.—Lewis, Fairchild & Co., have some 300 tous on the dump, and several thousand tons in sight in the mins. They are crushing 100 tons in Clark's mill which will pay very near $40 per ton, and have plsnty mors of the same sort on hand.

At the Good Hope they are taking out ors and driving work ahead.

At the San Busno the tunnel is being run ahead, and expect to strike the levsl svery day.

At ths Grasshopper they are taking out rich ore. A late crushing yielded $90 per ton.

INYO COUNTY.

THREE MONTHS.—Inyo *Independent*, Oct 12: From ths 27th of last June to the 30th of Sept. inclusivs, 22,402 bars of Cerro Gordo and O. L. S. L. Co.'s bullion, weighing 952 tons and valued at about $200 per ton, were put on teams for Los Angelss. At last accounts there were ssveral thousand tons more lying at ths furnaces awaiting shipment. This is from 3 furnaces, viz: Brady's, Belshaw's and the Swansea, or O. L. S. L. Co's.

STRUCK IT.—J. Chastine, on a rscent prospecting trip in the White Mts. discovered a ledge of galena, near Dser Crssk, 4 ft. in width, solid lead.

LEAD ORE.—It is stated that over 800 tons have been sxtractsd from the Union Cerro Gordo, within the past tsn months.

WAUCOBA.—Havilah *Miner*, Oct. 12: C. D. Bsgole showed us some silver ore specimens from Waucoba, which he estimatss will go from $100 to $1,000 per ton.

KERN COUNTY.

JOE WALKER.—Havilah *Miner*, Octobsr 12: The mine will be started up in full blast in about 6 weeks.

THE ST. JOHN—Now measurss 9 ft. at the bottom of the shaft, which is over 400 ft. in depth, with rock of unusual richnsss.

The ledgs of ths Bright Star has increased to 8 ft. in width.

Rumor has it that au extraordinary rich body of ore has been struok in the Sumner at Kernville.

SAN DIEGO COUNTY.

JULIAN DIST.—Los Angeles *News*, Oct. 12: There are 9 mines being profitably worked from which ore is extracted yielding from $80 to $200 per ton. Recently, Mr. Bicknsll crushed 100 tons of Golden Chariot ore, from which he extracted, by the Wilson process, $24,000 worth of gold. There is now lying on the dump of the Goldsn Chariot, rsady for orushing, a quantity of ore valued at $50,000. From 200 to 250 miners are at present smployesd in the dist. Thers are 9 qnartz mills at work; and the foundation of another one has been laid.

NEVADA COUNTY.

EUREKA.—G. V. *Union*, Oct. 20: This annual report shows bullion recsipts for the year to Sep. 30th $219,410; total recsipts, $223,922 65; expsnsss, $162,122 79; profits, $61,799 86, of which $20,000 was paid for dividends, cash on hand Oct. 1, 1872, $60,554 54. "There were 9,925 tons hoisted and 9,740 tons crushed. There ars upwards of 4,000 tons of good pay ore in sight.

In the bottom of the Roannaiss shaft (which is 68 ft. deep) there is a ledge 2¼ ft. wide, with perfect walls, but ths quartz is poor. This mine from Oct. 1st, 1865, to Oct. 1st, 1872, extracted $3,585,543 of bullion, and the net profits were $2,224,651.

REESE MINE.—Reese a few days ago in cutting for a drain struck an under ledge. He is getting good prospects from this, as high as $5 to a pan having bsen obtained.

ITEMS.—The Empire ledge continues rich with every appearance of permansnce. On the 15th inst. was brought to Delano's a brick, ths result of one week's run with 20 stamps, valued at $5,500. The Eureka sent off, on the 15th inst., gold bricks worth $15,500.

EUREKA.—Nsvada *Transcript*, Oct. 18: The Erie Co., is putting up nsw works and stronger machinery. Tbey havs a ledge from 10 to 20 ft. wide with exeellent rock, and are down 280 ft. the ledgs continually improving.

The Rising. Star, Devil's Cañon is bsing steadily worksd.

At Rocky Glsn mine, ths mill is running and the mine being worked.

THE BLUE GRAVEL MINE.—Placer *Herald*, Oct. 9: A powerful engins, pumps and hoisting works are at work, and developments are beginning to bs mads. The works are at the end of a tuunel 750 ft. long and 187 ft. below the surface. The inclins at this point has bsen sunk from the above point down beside the rim rock of the old channel to a depth of 60 ft. at which point they have struck splendid gravsl.

AUBUEN.—Placsr *Argus*, Oct. 18: The Auburn Co. have struck unusual riches. They are in 175-ft. level. About 9 days ago the wealth of the mine was uncased. Thsre is one solid wall of slate ledge. From the shaft the drift is in 60 ft. with an averags drift of ledge of over 3 ft. The Co. have between the 2 lower levels over 90 ft. of backs, and it is expected a crushing of over 100 tons will be taken out the prssent month.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, Oct. 10: Bullion amounting to $1,130 was shipped to S. F. yesterday.

SIERRA COUNTY.

Hoo Canon Mine.—Downieville *Messenger*, Oct. 19: At present tailings from the old Lamping mill are being worked over with the most favorable results.

Buttes.—The Quartz Co. have commenced rebnilding their flume.

Quartz.—The owners of the Oro Qnartz Mine have struck a body of very good ore in their claim, and fitted n small mill for roducing it.

TUOLUMNE COUNTY.

Struck It.—Sonora *Independent*, Oct. 19: Whiting, Wilson, Gorham & Baule, on the old Ford Lead, Saw Mill Flat, struck another rich pocket. On Thursday and Friday of last week, they took out $1,500, and have taken out good wages ever since they struck the pocket before.

The Silver Mine—Taken np by Magruder, about 6 milee east of Sonora, ie turning ont splendidly. They are now engaged in sinking a shaft. The ore consists of lead, silver and gold, and assays $242 per tou silver.

They are down in the App 700 ft. and the character of the ore is very rich, with gold frequently preceptible. The Heslep hae a vein 7 to 9 ft. wide. The average milling rock is said to be $15 per ton.

Nevada.

ELKO COUNTY.

Cope.—Elko *Independent*, Oct. 12: The Hunter ia sunk 45 ft., the ledge nveraging from the top to the bottom of the shnft one foot in width. The rock is first quality and will mill $400 per ton, of which ore the Co. has about 20 tons on dump.

Schaher and O'Malley have struck a rich pocket between the El Dorado and Excelsior mines.

The Southern Light is about to have a crushing.

The Independence Co. has juet let a contract for the running of their adit level 100 ft. or to strike the lode.

The Excelsior ie being sunk below the adit level with speed. The ledge in the north shaft is 3 ft. wide with good pay ore, averaging $65 per ton.

EUREKA DISTRICT.

Bullion.—Enreka *Sentinel*, Octoher 13: W. F. & Co., shipped yeeterday, 6 hnrs valued nt $4,545.89.

Spring Valley.—The Murray ehowe a wide vein of fine ore, and hae 60 tons of high grade ore on dump. The Farrell and the Curtie & Co., each have on hand about 20 tone of ore. The Washington has plenty of good ore in sight. The North Star ehowe a wide vein of ore. The average value of this ore, ae judged from that which has previously been worked and from aseays, is about $300 per ton.

Cleaning Up.—The Lemon mill has stopped work for 2 or 3 daye to clean up. Its firet run since repaire have bsen made is entirely satisfactory to all.

Staike.—A mine which promiees to be very rich, was discovered on the 7th inst., ahout 4 miles from thie place, in a south-easterly direction.

Hannah.—This mine is ehowing a ledge of fine ore 14 ft in width. The perpendicular shaft ie down 250 ft, and a whim ie being put up for hoieting purposee.

Home Ticket.—The new tunnel is in about 125 ft, the face ehowing a large amount of iron interepersed with ore. There are near 700 tone of ore on dump, estimated to be worth on an nverago $75 per ton.

Phœnix Bullion.—The total produet of the new furnace hae averaged about $450 per ton. 10 tone of bullion are heing produced every 24 hours, or an aggregate yield of $4,500.

Coy Hill.—In the Paul Jones very rich ore has lately been found, containing a large amount of horn silver. The Lemon mill only a few days ago, returned $405 per ton for the first class ore, and $106 for the second clase. The ore from the other minee ie of lower grade, averaging about $70 per ton.

ELY DISTRICT.

Bullion.—Ely *Record*, Oct- 13: The bullion product for the week amonnts to $116,553.92.

Floral Mill.—It ie expsted that the mill will be finiehed by Dec. 1st.

Huhn & Hunt.—About 16 tons per day is being rnised. In the mine, drifting ie going on at hoth fnces of the 90 ft. level. Thie level ie in fine ore throughont, and ehows well as drifting proceede. A winze is being eunk from thie level, a short distance from the bottom of the shaft, and ehows ore of quite a high grade.

Poatland.—The tnunel hae been run through a vein fully 8 ft wide. A winze has been started on thie lead, and einking will be energetically carried on; 3 shifts of 5 men each are engaged on the worke.

Chief of the Hill.—Third winze from the tunnel level has been commenced. Winzee Noe. 1 and 2 are being sunk on the ledge. They show abundance of good ore, of which abont 10 tons per day is being extracted. The bullion yield for the week ie about $7,000.

American Flag.—The main incline is 312 ft. deep. At thie point a etation will be formed and levels run off. The easterly one ie already commenced and ie in about 6 or 8 ft. On the 260 ft. or 3d level winze ie being eunk from the west drift at a point about 105 ft.from the ehaft. Thie winze has reached a depth of 100 ft. and ehowe good ore all the way. In the easterly drift of this level a winze has been started about 106 ft.from the ehaft and ie about 14 or 15 ft. in depth. It showe good ore. Stoping between the eecond and third easterly levele is going on to a considerable extent.

Amador Tunnel—Attained 270 ft. The winze that is being snnk about 113 ft, from the mouth of the tunnel is 32 ft. deep. At the bottom it reveals a ledge of from 3 to 4 ft. in width. Two assays were made yesterday from ore taken from the winze which gave an avsrage of $1,000.

Paoe ann Panaca.—The work of siuking the ehaft is going on. It is now down fnlly 450 ft. The drift on the 400 ft. level is about 130 ft.and will he continued until it strikes the ledge.

Sunbeam.—The shaft ie down 210 ft. and still sinking. About 15 tons of ore is hrought to the surface daily. It is very rich, and will fully average $130 per ton.

Meadow Valley.—The working force has beeu reduced by nbout 100 men.

Excelsior.—The main workiug shaft is ahont 70 ft. in depth and will be sunk until it strikes the ledge. The incline has reached 200 ft. Stoping is going on in the 70 and 90 ft. levels.

Kinston.—Capt. Ketton hae received orders from the Bay to commence timhering the shaft. Hoisting machinery hns heen ordered.

Arkaneas.—The incline shaft hae reached 315 ft. The 120 ft. and 250 ft. levels are being opened, and excellent ore ie being found in both.

Gray Eagle.—A rich body of ore was struck on Friday last. It asssye high and there appears to be n large body of ore.

Pacific Tunnel.—This week 10 ft. has bsen added to the length of this tunnel.

Inoomar.—The contractors for sinking the main shaft have sunk about 24 ft. during the past week, giving a total depth of 450 ft.

Lillian Hall.—Work on the incline, which is 207 ft. deep, has been temporarily suspended. Drifting is going on in the 70 ft. weetern level and is in 46 ft. Yesterdny some ore was struck in this level which looked favorahle.

Mocking Bian.—The shaft is 125 ft. in depth and at the hottom shows some rich streaks or feedsre which are nnking into the ledge. Drifting is going on from the shaft for the purpose of cutting the vein.

Baltic.—The ore is improving in quantity and quality. The ledge occupiee the full width of the shaft—4 ft. The shaft is 85 ft. deep.

Kentucky.—The shaft is 380 ft. in depth. Drifting is being carried on at the 330 ft. level.

Jolly Traveler.—The vertical ehaft ie 100 ft. deep. Streake of ore are found at the bottom which are very rich.

Mazeppa.—Sinkiug the working shaft which ie 70 ft. deep.

HUMBOLDT.

Bullion. — Unionville *Silver State*, Oct. 9: Amount ehipped from the Arizona since our laet iesue, was $7,560.

White Cloud Dist. — Extensive deposite of copper ore have recently been discovered. The ore ie of a high grade.

Krom Concentrator. — The frame-work of the Co.'e huilding, in Star Cañon, ie nearly completed, and will be raieed next week.

Relief Dist.—The Batavia and Pacific ie looking better in the lower levele thau ever before. The "pay-streak" is wider and richer than it wae nenrer the surface. The Co. have several tone of shipping and a large quantity of milling ore on the dump.

Arizona and Manitowoo Mine. — An immense chamher of ore of a high grade hae recently heen developed in the Arizona. The ledge at this point is, on an average, 15 ft. wide, ae far as explored. In Manitowoc, as in the Arizona, there is plenty of ore in eight. A new tunnel ie being run in to atrike the ledge at a greater depth.

Sacramento Dist.—A few weeke ago we noticed the diecovery of a rich ledge. The owners have eunk a shaft fifty feet deep on it, nnd are still sinking. The vein ie from 15 to 20 inehes wide, and exceedingly rich.

REESE RIVER.

Bullion. — Reese River *Reveille*, Oct. 12: W. F. & Co., during Sept., ebipped from thie city 68 bars, weighing 6,895 lbe., and valued at $101,134.21. All except 3 were from the Manhattan mill.

Moaoan and Muncy. — Good ore continuee to come from the 300-ft. level, and the ledge looks firet rate.

South America.—Keeping the water out and doing eome prospect work.

Savannah. — The hoisting worke are completed and running, and the shaft ie being pnehed vigorously with three eight-hour shifte; 2 ledgee have been cut by the ehaft.

Lone Star.—Sinking an incline from the 127-ft. level, and getting firet-rate ore.

Isabella.—The Ogden incline is being pushed rapidly; good ore coming from the O'Connel ledge; new lease let on the Isabella ledge, 25 men at work.

King Alfred. — The large shaft is being sunk.

Grove Tunnel.—Kane & Ledolph, lessees, at the 200-ft. east level, have a fine ledge, are getting elegant ore, and have about 15 tons of high-grade ore on hand. Hopley & Co., also, have a lease ou the same level, and are getting fair ore. Canaley & Co. have a leaee in the 250-ft. level and have good ore in eight.

Whitlach Union. — Breasting in the ore-chamber continnes.

Oregon Shaft.—An increased quantity of ore ia being raieed.

Viaginia.—O'Kane ie driving ahead with the tunnel, which ie in about 300 ft.

Patriot.—The mine is in fine condition and sending up considerable quantities of good ore.

Stonewall.—Getting some very good ore.

Belmont—Monitor Co.—Driving tunnel No. 2 with 3 ehifte of men. Taking out considerable fine ore from south incline. The Monitor mill machinery is nearly all placed. Working on mines and mill 60 men.

El Dorado Co.—Hsve jnst received three large losds more of machinery.

WASHOE.

American Flat.—Virginia *Enterprise*, Oct. 17: A good deal of prospecting is going on. The great strikee made in the Crown Point and Belcher have caused a resumption of work on many of the hest locatious, which is now heing carried on with commendable vigor. The Knickerbocker, Arizona and Utnh, and the Tiger Cos. are all at work.

Summary.—Gold Hill *News*, Oct. 19: Savage.—Daily yield 160 tons worth $28 per ton. The incline is down 205 ft. below the 1500-ft. level, in fnir sinking ground. The connection ie completed between the main south drift of the 1500-ft. level and the works of the Hale & Norcroee, giving a fine circulation of good air. The ore stopss on the 1500-ft. level are opening up well, with an improvement in the qnality of the ore. The body of ore on the 500-ft. level of the old works is opening out in width to the southward.

Julia.—Assays last week ran as high as $100 per ton. The 800-ft. level looks finely. The frame of the new hoisting works buildiug is up and partly inclosed.

Silver Hill.—The advancement downward of the main shaft is continued. The vein penetrated hy this opening is well defined, and consiste of quartz of a very promising appenrance. On the first level the main adit is run westward. It has cut during the past week through several veins of medium grade.

Utah.—The new shaft is sunk over 200 ft. The old adit ie reopened nnd cleaned out for a considerable distance north and west from the east wall. The exploring drifts at this depth are found to be of greater extent than was anticipated.

Crown Point.—The ore hreasts and stopes of the 1100 and 1200-ft. levels are holding out splendidly. The ventilation of the 1300-ft. level heing good, cross-cutting is actively developing the fine body of ore at that point. Cross-cutting at the 1200-ft level, 45 ft. from the Belcher line, shows the ore vein to be 140 ft. or more in width.

Hale & Noacross.—The increase of the depth is gradual. The yield of ore from all the levels approximate 120 tons daily.

Kentuck.—Daily yield reduced to 30 tons, keeping one mill running. The drift hstween the 400 and 500 ft. levele ie likely to open out a considerable amount of ore. Cross-cutting and drifting at the 1100 ft. level is vigorously heing prosecuted.

Con. Virginia.—The main drift on the 1167-ft. level is pushed vigorously ahead, the face in hard, blasting porphyry. Prospecting on the 500 ft. level is prosecuted vigorously. The shaft is being cleaned out and prepared for the work of sinking.

Belcher. — Daily yield 200 tons from the 1000 and 1100 ft. levels. The ore breaets and etopee in these levels continue looking and yielding splendidly.

Occidental.—The contract for running the main adit 300 ft. is completed.

Imperial-Empire.—The surface work for the new pumping machinery is progreseing rapidly. The south drift on the 1700-ft. level is heing pushed rapidly ahead.

Insuance.—The fine hody of ore fonnd last week on the north drift, holds out and improvee, and it hns also been etruck in the bottom of the shaft.

Jacoa Little. — Considerable quantitiee of free gold were found in the ore extracted during the week, and the vein looke more promising than ever. The lower tunnel ie in 60 feet.

Yellow Jacket.—Daily yield 20 tons from the old levels. Cross-cutting at the 1,300 ft. level. The new pump machinery ie completed and ready for aervice.

Overman.—The surface work for the new machinery is fast drawing to completion.

Chollar-Potosi.—Daily yield 170 tone, worth $31 per ton. Repairing the ehaft will eoon be finished. The eurface machinery work ie nearly completed. The Belvidere, Blue Wing and other ore-producing sections are looking well.

Baltimore.—The new plunger pump wae completed in ite position yesterday, since which time it bas worked well.

Sierra Nevada.—The prospecting drifts weet on the 500-ft. level are pushed steadily ahead with fair expectatione. The mill ie kept eteadily running on ore from the upper and middle portions of the mine.

Buckeye.—The fine body of ore developed at the 375-ft. level showe better as further penetrated.

Daney.—Maiu shaft down 83 ft. below the 600-ft. level. The bottom of the shaft ie in very promieing looking veiu matter.

Woodville.—Daily yield 10 tons of high grade ore. The new hoisting worke are fast approaching completion.

Knickebaocker.—The drift at tbe 400-ft. level is in 224 ft. Indicatione favorable, but rock hard. Work progressing well.

WHITE PINE.

Bullion.—White Pine *News*, Oct. 12: The shipment from White Pine, during the past week, wae $15,359.19.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—The Eberhardt and Blue Bell shafts are sinking. In the Ridsdale and De Pass chambers are drifting from the bottom of the Risdale shaft to connect with the South Aurora tunnel, which ie expected to be made in a few days, and one wagon load of ore ie shipped to the Big Smoky mill daily. Working in the South chamber from the Lady's chamber, the ore being of a high grade.

Beecher Cons.—The ore in the old Blasdel works continues to hold out, and the regular shipment of rock to mill is daily made. In the Beecher works it is supposed a body of ore has been struck.

O. H. Treasure.—The various workings are looking well. The Wheeler tunnel is being pushed ahead in the same spar and vein matter, which is dipping downward.

Sunbeam.—Continue sinking in the Moscow shaft, and are down about 90 ft. where ore of a high grade hae been struck in several places.

East Shenoyoan.—A drift is heing pushed ahead to form a connection with the southwest drift, with favorable indicntions of getting ore.

Silver Plate.—Running in the tunnel, which is about 50 ft. deep, in good ore all the way. The mine is looking well. Considerable ore on dump.

Outside Dists.—Schell Creek.—Work on the Tehama Co.'e 20-stamp mill ie being pushed, and it will be completed ahout the middle of next month. The DeMill miue is showing a large body of good ore, and improving daily in quality and quantity.

Robinson.—The minee are looking well and considerable work done to develop them.

New Mines.—The new mines, near Rohinson, are steadily improving. The Emma is tnking out good ore of a high-grade. The Troy, the first extensiou on the Hays, has struck a body of high-grade ore in the shaft at a depth of 28 ft.

Mills—Big Smoky.—Running on ore from the Eberhardt & Aurora Co.'s mines.

Manhattan.—Running steadily on ore from the Beecher Cons.

Tailing Mill.—This mill below Shermantown, started np last week on tailings.

Schell Creek.—Schell Creek *Prospect*, Oct. 12: McMahon.—The shaft is down about 80 ft. below croppings showing at the bottom ore of high grade. There are 3 shifts at work. The tunuel is in 69 ft. the face showing 4 ft. wide of vein matter indicating the presence of a new lode,

Summit.—Work was discontinued on Monday for a short while only.

Jupiter—Being worked steadily, and looks better every day. The shaft is down some 50 ft. ehowing good milling ore.

Kavanagh Tunnel.—Is in 92 ft. in decomposed qnartz.

Tehama.—Working a large force daily. The different shafts, tunnele, etc., are being put through faet. The mine ie looking better ae work progreeees, ore of good quality being extracted.

Schell Creek.—Tunnel in 225 ft., passed through etrata of quartz in the middle of the week. Work on croppings progreesing. Some ore being extracted. Working 3 shifts daily.

Albert.—Running tunnel which ie in about 56 ft., taking out ore.

Queen Sprinos.—Labross Tunnel.—Tunnel being run steadily is in 190 ft. showing indicatione of soon striking ore. Two shifts at work every day.

Nutmeg.—In the wide open cut ore of fine qunlity can be seen.

Citizen.—The ore is of the finest quality.

San Francisco.—Being worked every day; ehaft down about 40 ft. showing well at the bottom. There is considerable ore on dump.

Arizona.

Ore.—Prescott *Miner*, Oct. 5: A great deal of high grade ore has recently been ehipped to S. F. from Mohave nnd Yuma Countiee, and late news from Wallapai, Castle Dome and other leading diets. attest that more is being raised from over a dozen minee.

Colorado.

Boulder Co.—Colorado Springe *Out West*, Oct. 7: The Bonlder Co. Coral, Mammoth, Sovereign People, and Cardinal are heing worked with eatisfactory resulte.

Havens & Bottleson are drifting on the Sherman lode and taking out about 5 tons per day of ore, but little inferior to the Caribon ore.

Six eilver bricks, the product of the Caribou, passed throngh a few days eince. Their value was about $10,000.

Montana.

Shipments.—Virginia *Montanian*, Oct. 10: The two banking housee of Virginia, on Tuesday ehipped 1,250 ozs. of gold ($22,000).

Lincoln Gulch.—Deer Lodge *Independent*, Oct. 12: There are 10 companiee working with good reeults. Enoch Johns & Co. of the Lincoln Drain Co., are averaging $15 per day to the man and they have ground enough to last for years.

Utah.

Parley's Park.—Cor. S. L. *Tribune*, Oct. 14: There are about 500 men prospecting and mining in the hille east of the Cottonwoods.

Hurst and Chambere hae erected eubetantial winter quartere for abont 25 men, running in 8 hour ehifts npon the Ontario. They have a shaft down 75 ft. ehowing a continuous vein of rich, free milling ore 3 ft. in width. They have a large amount of high grade ore on dump.

One mile to the south-west of the Flagstaff, is a group of ledgee of which very little notice has yet been taken. Around them there is an abundance of low grade rock, enough to keep a mill constantly supplied for years. Wood and water are plentiful and convenient.

Pears.—C. W. Pomeroy, from his orchard at San José, has sent us a box of delicions pears, He will please accept our thsnks.

Natural History of the Animal Kingdom.

While Professor Agassiz wss iu this city he delivered a lecture hefore the California Acsdemy of Sciences, a synopsis of which we gsve in our issue of Sept. 28th, at the same time promising to give it in full as soon as the diagrams oould he prepared to accompsny it. The Professor's slightly foreign accent and construction of sentences ie suggested hy the literal transcript from the short-hand notes of Amos Bowman. The cuts will he found on p. 265. After a few general remarks, the Professor took up the subject of the "Natural History of the Animal Kingdom" as that with which he was most familiar. He said :

As it is generally understood, the study of this subject consists in being made familiar with the variety of animals which inhabit the surface of our globe, with their mode of life, with their uses and purposes, with a sketch of their relations to one another. But now-a-days the efforts of naturalists go far beyond that. We aim at nothiug less than understanding how they came to be called into existence. What are their relations to one another, not only, but to the world on which they live and to the oause from which they rise? And it is not to be wondered at that upon dealing with such a comprehensive subject, opinions should vary, and there should be

Mighty Conflicts

Among the most earnest and devoted students of uature. Do you not disagree in your deliberations concerning the welfare of your fellowmen? Why should we, who are dealiug with subjects perhaps of greater difficulty—certainly, with subjects which have attracted attention for a shorter time—to be at once agreed on every point? We have no greater power with which to treat these subjects than an able lawyer has, dealing with his case, than a physician has, dealing with his patient,· than a divine has, dealing with questions of a greater import to every human sonl. And these powers being limited, it is natural that our results should frequently be conflicting, but the more conflicting they are, the more likely are we to be stimulated to renewed efforts and to greater and more comprehensive application.

I will not attempt to define animal life. I will not attempt to compare animal life with vegetable life. I will only at once proceed to show you what we kuow generally concerning

Resemblances Among Animals,

And on what these resembances are founded, that yon may realize how it is possible for a naturalist to become familiar with this host of living beings which inhabit the surface of the globe. There are several hundred thousands of them, several hundred thousand different kinds of them, inhabiting the surface of the globe, and yet all these hosts are built on a few patterns so simple, so easily understood, that every child ought now to know how to distinguish these patterns, these plans of structure, with the same readiness with which it defines a square or circle. And there is no more difficulty ahout it than there is in nnderstanding the most elementary facts of geometry or arithmetic. The only difficulty lies in the fact that

There are no Teachers;

That the community lacks teachers in this department; aud wherever there are a few educated, they are at once swallowed up by the numerous institutions of learning which are organizing everywhere. And we cannot educate a sufficient number of them, for the simple reason that there are other walks in life which are more promising in the rewards they secure to their devotees. So science is always behindhand, and yet it is she who furnishes the primary material for all the progress in modern times.

But to return to the animal kingdom, this great diversity of thought from man through all the range of quadrupeds, birds, reptiles, fishes, shells, crabs and insects down to the simplest polyps, their immense diversity as to number can really be brought down to four simple plans, and these plsns may be expressed in formulæ which are of the simplest nature.

Suppose I take for the first [walking to the black-board] animals which go by the name of

Radiates,

Their organization corresponding to the' idea involved in that name. All their parts stand to a central axis, like the rays to a centre. Nothing will give a better idea of one of them than a star fish, where we have an animal provided with a mouth at the center, having a large sack into which that mouth leads, and from it a number of sacks, extendiug into those rays, at the end of which there is to eaoh one an eye, a ring of nerve around the mouth, which sends a thread to each one of those rays a number of little bags, which terminate in euckers, hy which the animal is set in motion; by which you oan see a repetition of identical parts around the common center. And this idea of radiation, assumes the most diversified forms; whether it be that sea urchin, in which we have the same general arrangements again in which only the form is that of a sphere instead of being that of a star; or that of a polyp, in which we have something of a cylindrical body with a number of rays around the summit, around the mouth the same opening into a sack which communicates with the same cavity; or be it a jelly fish, which has a secular disc and central cavity with channels extending to the periphery, and communicating with a circular ring and other appendages hsnging down upon the margin.

You see everywhere a repetition of the ssme idea; radiation around the center and a repetition of the identical psrts aronnd a vertical axis. And the number of these animsls is about as great as thst of any type of animals, but they are all aquatic; most of them with very few exceptions marine, and therefore less known to the cssual observer. We distinguish smong them

Three Classes,

Polyps, in which the body is a simple bag, as I have represented here; that of the jelly fishes *acalephæ*, in which we have a central cavity with tuhes radiating from it; and that of the star fishes, or sea-urchins, or echinoderms in which there is an internal cavity and external envelope. So you see here a regular gradation amongst these three classes; the *polyps*, the lowest; the *acalephæ*, next; the *echinoderms*, highest. And the fact that they keep this gradation can be rendered more plain by taking the time to enter into details of their structure. To show for instance that we have a well marked nervous system in star fishes and polyps, we have only to observe that the locomotive organs are at the same time organs of digestion, in fact performing all the functions necessary for the maiutenance of life. While in the next higher class, the *acalephæ*, we have already some division of labor in the fact that there is a central cavity in which the food is received and elaborated, and from which it circulates into those tubes. through the whole of the system, to return to a center, while the refuse matter is thrown out through the same cavity in which the food was introduced. Now in those others, the star fishes, the sea urchins, the isolation of the nervous system, their position in a central cavity surrounded by a distinct envelope, show still a higher position. I may therefore say that in that type of animals in which radiation is the fundamental idea, we have three classes in which a different application of organs shows the relative standing; and that this may not be overlooked as I proceed in my argument I will write down these few subdivisions here. [Advancing to the board and writing.]

Radiates, with three classes, being *polyps acalephs* and *echinoderms*.

All these animals are scattered over the whole surface of the globe, and may be found from pole to pole in all latitudes along onr shors, and in the depths of the ocean, swimming in medium depths or scattered over the surface of the sea. The next group, which has a very different coustitution, is that of the

Mollusks;

They are soft animals; may be protected by a shelly envelope, forming a sort of bag in which all the organs are contaiued; of which our oyster gives a very good example, and in which the organization is about such. Suppose we have here an oyster from which one of the shells are removed; we see here a ligament by by which two shells are united with one another —if you look in a transverse section—that being the cavity occupied by the fleshy part of the oyster; there is a large fleshy mass which is commonly called the eye and muscle; a fleshy bundle which unites the two bands to one another, moving into one another; a skin lying in the shell, all over, and by the secretion of which the shell itself is formed. Suppose that I lift it, you shall see that under it will have formed another layer, the margin of which is fringed all over. It has a respiratory organ which extends all around; of these there are two, one within the other; and within this upper part we have the digestive cavity with its appendages, the liver surrounding the stomach, a heart, which is placed above the intestines sometimes surrouding it, and the reproductive parts filling the remainder of the cavity. And in all of these

Kinds of Structure

We have also three gradations, the sample of which is that which I have represented here in the case of the shell, which we call bivalve *acephalæ* from the fact that there is no region in which a distinct head could be recognized. But the moment we proceed to a higher grade we find there is developed below a fleshy mass; that in front there are appendages around the mouth, extending forwards and receding upwards; that the shell is united in one simple, continuous shield and that under it those parts which hang loose below, are drawn up, and sealed on the general envelope. And we rise as it were to the condition which we have in the snail, in which, in a snail coiled up, all those parts are now enclosed, and in which this fleshy mass represents the organs mentioned, and there are appendages around the head and these feelers extend forward, on the summit of which msy he seen eyes. There is no organ there which we have not here; it is only raiscd to a higher condition of existence. If we add to that the state of things which we observe in the cuttle fish the difference consists mainly in the fact that these two feelers are reduced to a lower position, but the eyes are largely developed and the body is separated from the rest by a constriction here; on the sides we have two wing-like appendages; the food is transfused into a sort of syphon with an opening through which the water may be ejected so as to help direct the course of the animal; and around the mouth a uumber of arm-like appendages which serve as organs of locomotion and as organs for the apprehension of food. This is what we call squids, cuttle-fish and the like, and which are occasionally called in this neighborhood, I uuderstand, "devil fish."

Now these are the three groups of *Mollusks*, the three clsses, *acephalæ* or *bivalve*, *gasteropods*, the *encephalopods (?)* and *cephalopods* or squids and the like.

Why I aim at reproducing these details you will see presently. The next kind is that of the

Articulates.

The name *mollusks* applies well to these animals, you perceive, from the fsct thst most of them have a very soft body, even though they are protected hy a hard shell.

The third type is that of the *articulates*; and here we hsve a totally different idea and body, in the structure of these animals. The body is a cylinder divided by transverse ridges, in which are a numher of rings, movahle one upon the other—such are all the worms—for these rings are combined in such a manner as to form two distinct regions of the body; an anterior one to which there are distinct locomotive appendages; and a posterior one which is more distinctly articulated than the other, with fins, (feet) underneath. The type is that of the lobster or shrimp, and the like. And the third representative of this class in which the body is divided into three regions: this includes the insects. Now yon see at once here again, (see cuts), a complication of structure from the more simple uniform cylindrical body of the worm, and the cylindrical body of the shrimp or crab, in which the division of the body into two regions is distinct, while in the worm's, wherever there are locomotive appendages, they are all alike.

In the insect kind there are three divisions of the body well marked; the first representing a sort of head, the middle a sort of chest, and the hind one a sort of abdominal region in which the articulations are distinct. Here again I may mark down three kinds; the worms, *crustaceae* and insects. Without going any further you perceive at once that it is a totally different idea which is embodied in these animals, in the *articulates*, from that which is embodied in the *radiates*, not to speak of the *mollusks*, the organization of which is perhaps not so easily nnderstood without a more extensive acquaintance with

Comparative Anatomy.

To take the *radiates* by themselves and compare them with the *articulates*, you see at once how totally distinct the plan of structure of the two groups of animals are; aud that their original ideas which are at the foundation of all these, are perfectly plain to any one who chooses to analyze these things. It is not a mere fact that there are worms here, and that there are insects there, and *crustaceae* there, and that these animals are scattered all over the globe. They are connected with one another by an idea which the human mind is capable of comprehending, of reducing to the simplest formula, to a formula so simple that it may be understood by a child.

And now let us look at the other animals. How does man stand in nature? What are his relations to the other living beings which exist on earth by his side?

That position is easily determined, and that not from any very extensive acquaintance with the subject. You can reduce man to the

Structure of a Fish

And you will find he has nothing but what the fish has. And there is a gradation from the fish up to man which is perfectly simple. Here we have a backbone, which is the fonndation of the whole structure. Upon the backbone rise spines which extend the whole length of the back; under the backbone are other spines which extend all along the lower side of the body, [See cuts.] and that is surrounded by flesh; and upon the flesh is a distinct skin. Now let us examine what are the relations of these parts in a transverse section. [See cuts.] If we cut a fish across in that way we find that the hackbone forms a solid center here, that these spines constitute an arch above; that that arch embraces a cavity in which is the spinal marrow; that another arch below surrounds the intestines, and that the flesh which is attached to these spines occnpies the whole ontside of the fish.

Whether we make a section through the head or through the tail, we shall find the same elements; only in the head, that cavity which is above the prolongation of the backbone is enlarged and represents the cavity of the skull; the spinal marrow all along here swells and enlarges in the head into a brain, and in the lower cavity where we have under the tail merely a blood vessel, we find that in the abdominal regions we have the intestines; and in the higher animals of that type we have the chest in which the respiratory organs and the heart are separated from the intestines. But it is everywhere the same thing, repeated in all its various combinations fram the fish up to man. For we need only to look at the embryo, that is, at the young, before it has acquired its full size; we find that the first then has more of these appendages which we call fins, but tapers gradually to a single tail. We find that it has none of those other appendages which we call fins slong the chest; and we find that in order to raise the fish to the condition of the reptile, we have only to mark a slight contraction between the head and the trunk, and to raise the head slightly npwards so that the head shall no longer be on a level with the rest of the body, and to secure for the limbs that kind of transformation, which, instead of presenting a uumber or developed fingers, will have single fingers, say three or four or five, spaced a little further apart one from the other.

And thus we are led to the condition of the

Lower Reptiles,

The salamander or lizsrd. And if we widen the hody or shorten it we srrive at the condition of the turtle. If, instesd of allowing the body to remsin horizontal, as it is here (see cuts), and the tail to have that prominent elongation curtailed to a short termination of the vertbræ, and we give legs and raise the anterior part of the body on this end of the legs, trsnsform the posterior from this condition into that, we hsve the brute; and the relation of brute and reptile, as those of reptiles and fish, are so simple that you need not have a large museum to show all these grsdstions. They psss from one to another; and in the condition of quadrupeds, when we come to man, the only difference is that the head predominates, and the limhs, stomach and other organs are kept in subordination or in the control of the head, of the brain, of the intelligence; so that we may truly say that man is only a higher organized and intellectnal creature, built upon the plan which is already indicated in the condition of the fish. And this is one of the general results of modern investigation in the comparison of these different classes of animals.

The type of these animals are called *vertebræ*, and the type *vertebrates* embraces four. It may be a larger number of classes, but for the purposes I have now before me, I say four; fishes, reptiles, birds and mammalia, including man. And now to repeat what I said at the beginning; all animals fonnd on the surface of the earth, without exception, find a ready place in one of these four types; among one of these four types. And on closer scrutiny all are found to belong to one or the other of these thirteen classes.

Now is it not worth while to learn that kind of animal geometry which teaches us at once to recognize under the most diversified forms, beings so closely akin that we may analyze them, and reduce them to their simplest formula? But their relations are still more intimate than would appear from this, and are linked together by a more all-pervading thought than they appear from this very rapid sketch, for if we examine their

Mode of Growth

We are struck with the fact that each one of these types which is perpetuated by the reproduction of young akin to themselves, passes during its growth throngh a succession of changes which are identical to the conditions we observe among those that have reached their perfect condition in their relative standing.

That may not be quite intelligible. Let me analyze my statement more fully. Here I have spoken of animals in their full growth, in their adult state. I have represented them as compared with one another. I have compared the *potyp*, which occupies the lowest position among the *radiates*, with the jelly fishes and *acalephs*, which occupy a higher position, and that of the sea urchins and star fishes which occupy a still higher position. I have shown you that all these three classes are built on the plan of *radiates*. The difference is chiefly in the complication of their structure. The same obtains for the *mollusks*. The same is very clear among the *articulates*. You have seen that between a worm and a *crustacean*, the difference is not one of plan, but it is one of complication. So it is with insects—only a difference of complication—and when you get to the vertebrates it is the same. In the fish we find the germs of mankind, and we find that between fish and man we have sn intermediate space filled by the reptiles, birds and quadrupeds. And all that is as studied among animals in their full grown condition. Now let ns examine the

Young of all These Animals,

Or at least some examples of them—that I may not trsspass upon your time or attempt what is impossible to give in an hour's time. Let us examine, for instance, the young of some *echinoderm*, of some sea urchin or of some star fish—that will be the most easily appreciated example. We have a figure of one of them. [See cuts.] Now the young of some of these star fishes, instead of being what I have represented them, first is a little *polyp*-like animal attsched to the ground by a stalk, having the stalk divided by transverse articulations, and presenting on the summit a number of rays surrounding a central cavity. When that animal grows to a large size, when its anterior organs have acquired a higher degree of complication, that star separates from the stalk, and the stalk vanishes and dries up, and we have then a free star fish. Or, let us say a

Jelly Fish.

The jelly fish in its perfect condition is a gelatinous disk with a number of appendages all around the disk and a central cavity with tubes radiating to the margin, and a nnmber of larger appendages around the mouth throngh which the food is brought in. That animal swims freely in the water. When it lays its eggs, those eggs are for a while little oblong bodies swimming freely in the water. After a while they select a place on which they become attached, and when they become attached they enlarge and expand into a clod-shaped body, and that clod-shaped body is itself enlarged along the margins so as to have as it were 4 horns around each summit. And presently that clod-shaped body grows into a more cylindrical or longer mass or stem, and upon the summit of these clod-shaped bodies have grown feelers; and instead of four, we may have 8 or 16 or a larger number; and in the center a depression is formed which enlarges into a

[Continued on page 265.]

Useful Information.

Popular Fallacies.

Two hundred years ago, that quaint old writor, Sir Thomas Browne, filled two large volumes with an account of what he conceived to be "Vulgar Errors" — *Pseudodoxia Epidemica* — and although modern science hae done much to diffueo sonnd knowledge in regard to tho phenomena around ns, yet popnlar fallacies have not, as yet, quite disappeared. Even our text-hooke of popular scienco, and many of our so-called scientific papers, continue to propagate and perpetuate mistakes which may well bo classed with the "vulgar errors" of Dr. Browno.

Tho Hair Not Tubular.

Thus nothing is more common than to hear of the tubular character of hair; indeed, almost every ono that we meet will, if asked, tell us that the hairs of our head are very fine tubes. And yet every hair is a good eolid cylinder—a fact which has been puhlished hundrede of times, hut which seeme to have no effect upon the popular helief. It ie true that a hair, whcn examinod under the microscope, looke something like a tube; but then eo does a eolid metaltic wire—a fino needle, for example. That which givo rise to the tubular appearance is simply the bright line which is always seen on every cylinder—a stove-pipe for example, or even a common hlack-lead pencil. When we take the hair, however, and having cut a slice off the end, examine tbis slice, we find that it is not a ring, as it would be if cut from the end of a tube; hut a solid disk.

Jupiler's Moons.

Another singular idea which has gained very general ground, is, that the moons of Jupiter can bo scen in a looking-glase; and if, some bright night, we try the experiment, we shall actually see Jupiter in the looking-glaes, accompanied hy a very faiut star, which constantly maintains the same distance from the planet. Further examination will eliow ns that every bright star preeents the same appearanco; and if we reflect a little upon the phenomenon, we shall eee that the eo-called moon is only the faint image of the star or planet reflected from the surface of the glase, while the bright image reflected from the surface of the mercury is what we call the star itself. A lamp or candle held hefore a thick mirror will preeent preciaely the same appearance. Simple thongh the explanatiou be, however, there are few errors that have taken a deeper hold on the minds of the pseudo-scientific than this.

Tha Sun Drawing Water.

Amongst popular fallaciee, a prominent place must bo given to those which arise from the actual deception of the senses; for neither our eyesight nor our sense of touch ie to be absolutely depended upon. Thus, the beantiful phenomenon known as "the eun drawing water" is caused simply hy tho rays of the sun piercing a rift in the clouds, and rendered more intense hy the prevailing gloom. Few people would believe that actuat measurement of the sun and moon, when near the horizon at rising or setting, would fail to ehow that they are then much larger than at other times; and yet, ullowing for the differeuce caused hy retraction, and which is too slight to he meaeured hy any but tho fineet instruments, actual measurement does show that not only their real, bnt their apparent sizes are precisely the same at all times.

Animalcules in Waler.

Another fallacy which is very prevalent is that every drop of water contains millions of animalculee, and that every pebble, indeed, overy fragment of solid matter on the face of the globe, is peopled with myriads of these small creatures. For this helief there ie, however, no foundation whatever. So far as animalcnles are concerned, most pebbles and fragmente of rocks are barren deserts, especially when dry; and good epring-water is, eo far as animal life is concerned, a liqnid waste. A few stray animalculcs may occaeionally be fonnd in the water that we drink; but if it is "filled" with animalcules, it is certainly not fit for hnman use, either as drink or in the preparation of food.

The Silicious Coaling of Grasses.

But while moet of the fallacies which we have mentioned are due to eimple ignorance, there is anothcr class which is based upon a eort of quasi-ecientific information, and which are far more dangerous. A good example of theee is the opinion generally held by half-taught chemists, that it ie to the silicioua coating of the grasses and cereale that these plants owe their power of standing up right—in other words, that it is to this that they owe their stiffnese. This opinion has been so firmly held by many, that they have advised the addition of silica to land for the purpose of giving stiffness to the straw, and thus preventing the lodging of the grain. Now, when we learn that almoet all soil coneists of at least one-half silica, we shall eee the absnrdity of snch advice. The truth is, that the stiffness of straw is not due to the silica at all; for chemiets have dissolved the eilica by means of hydrofluoric acid, and removed it completely from the vegetable stem, without impairing the stiffness of the latter.—*Leslie's Weekly.*

The Matter of Size.

If a greyhound were as large as an elephant, and had the power and strido that would correspond with his size, he wonld kill himself in running a mile. The material of hie frame would not stand the strain. The dranght horso is never a rsce-horse. Beyond a certain weight, the loss of the fleetness begins. Nature puts her materials into the best forms for securing her objects. The swallow is swifter than the swan.

Ship-builders have found, to their sorrowful and disastrous cost, that ahove a certain size a ehip ie profitless. Taking into cousideration the material of which ships aro made, the modes of handling them, and the needs of commerce, two ships possessing the aggregate capacity of the Great Eastern, are worth twice as much ae ehe. The statement will douhtlese be good for all timo. There ie a limit, fixed hy nature, in this matter of size, on all the instrumentalitiee of human commerce of every sort, beyond which results are unsetiefactory.

There will never he a railroad with a twenty-five feet gauge; there will never be another Great Eastern, and there will never be another Boeton Juhilee, of the magnitude of that which closed ite performancee on the fonrth of July. The nndertaking was gigantic, and it wae carried throngh with marvellous efficiency. The moneter experiment was not a failure in any respect except in the fact that its effccts did not at all correspond with ite eize. It demonetrated the fact that beyond a certain point of magnitude and numhers neither choruees nor orchestrae can increase their powers of muaical expreesion. One thoueand eingere in Music Hall would have been hetter handled, and would have prodnced a larger and finer musical expreesion, than twenty thoueand in the Coliseum. We are glad the experiment has been tried, and that it has proved that every city can have just as good musio in its own halls and churches as ean be had by gathering together the picked men and women of all the cities of the world. Yet it wae a eplendid experimont too, and none but jealoue niggards will fail to award to those who have tried it the great honor that belongs to them.—*Scribner.*

Ostrich Farms.

The raieing of the ostrich in a tame state for his feathers is now carried on extensively in Africa. The birds are kept in inclosures, and fed on lucerne, with which the inclosure ie planted. Every eight monthe they are plucked, some extracting the quill at once, and othere cutting the quill a little above its insertion, and then removing the roots a couple of months later. The latter method is said to give better results with lees injury to the bird. The yield is abont fifty dollars per annum for each bird.

In breeding it is found to be best to allow one female to each male, though in the wild state five females are often attached to a single male. There are usually two broods in a year, and the male and the female set on the eggs by turns, the male generally taking the largest share of this duty. The female takes chief charge of the brood after it is hatched. The youug are reared on chopped lucerne, and as they get older a little grain is given them; they also reqnire abundance of water and a liheral snpply of pulverized qnartz and small bones. When grown, no food suits them better than chopped lucerne or trefoil, with an occaeional snpply of cabbage, fruit and grain.—*Amer. Artisan.*

Court Plaster.—Soak bruehed isinglase in a little warm water for twenty-four hours; then evaporate nearly all the water by a gentle heat, dissolve the reeidue in a little proof sprite of wine, and strain the whole through a piece of open linen. The strained maes should be a stiff jelly when cool. Now, extend a piece of silk on a wooden frame, and fix it tight with tacks and packthread. Melt the jelly and apply it to the ailk thinly and evenly with a hair brush. A second coating mnst be applied when the first has dried. When both are dry, cover the whole surface with two or three coatings of balsam.

Ink Plant.—Botanists are endeavoring to introdnce and acclimate in Europe a plant of New Grenada, which will be a valuable acquisition to manufactories of ink. The juice or sap which it yields, and to which is given the name of *chanhi*, is at first of a reddish tint, bnt in a few houra becomes intensely black. It may be used without any preparation. The *chanhi* corrodes steel pens less than ordinary ink, and better resists the action of time and chemical agente. It is said that during the Spanieh domination all public documents were required to be written with thie ink; written otherwise, they were liable to damage by seawater.

To Destroy Ants. — Fill small vials two-thirds with water, and add sweet oil to float on the water to within half an inch of the top. Plunge these upright in the ground, leaving only half an inch standing out, near the nest or rune of the ants. The ants will come for a sip, and go home to die. No ineect can exiet with oil stopping np its spiracles or breathing pores.

Good Health.

Blushing.

Why do we blush? What is the cause? Can it ho prevented? Why do the young blush more readily than tho old?

In answer to these questions science comes to our aid and informs ue that this sudden reddening of the face is due to a rush of blood iuto the capillariee of the skin. The influence of nervous conditions is strikingly exhihited by this phenomenon, the circulation of the blood, or rather tho action of the heart heing responsive to those emotions and passions which have immediate relation to the brain and nervoue system.

There is a marked differenco among individuals in respect to hlushing. One who is very sensitive to praiee or hlame has large Veneration, Approhativenees, and Conscientiousneee—hlushes on the slighteet occasion; while oue with those organs small will he comparatively indifferent to either—will not be moved hy censnre or hy applause, hy the powers on earth or in heaven. A vivid consciousnees of one's poverty or ignorance, or other imperfection, tends to produce a feeling of hnmility, and this causes one to hlush. Large Self-eetcem, with intellect, culture and competence, givee assnrance, makes one foel always at home whereever he may happen to be, and this puts one ahove or heyond the disposition to blush. The old saying that "a guilty conscience neede no accnser," is based on the fact that oue nnder conviction ehows it in his face; and a young rogue, when confronted with hie wrong-doing, will usually hlneh just in proportion to his sensitivenese and his coneciousness of guilt.

The fact that one cannot overcome his diffidence and look friend or foe in the face, ie no evidence of sin or wickedueee, ae some suppose. On the contrary, it is often the case that the most inuocent and virtuous are so baehful that it is next to impoesihle for them to look even an inferior squarely and steadily in the eye. He soon falters and assumes a downcast look in keeping with his modest and seneitive nature. Self-confidence, for the diffident, may be acquired, and though one would almost eink in his shoes the first time when he appears to speak hefore an audience, he will, by practice, overcome his timidity, or "platform fever," ae it is called, and when used to it, enjoy the elight agitation as a mental luxury. At first he will be suffused with bluehes, and his mind will bo eomewhat bewildered; soon, however, equilibrium takes place and "Richard is himself again."

The temperament also has much to do with onr hlushing. A nervous, eanguine temperament is much more susceptible than the lymphatic or bilious, and a blonde than a brunette. The African, the Asiatic, and the North Amerinan Indian may feel a blush, though—owing to the color of his skin—he may not show it.

One cause of blushing, on the part of some children, is produced by the mode of government adopted by inconsiderate parents and impatient teachers. Instead of mild meaeures, they resort to the most severe, namely, to that of shaming them. "Oh, you little dunce!" or, "You blockhead! did you not know better than that?" If the child really believes the parent or teacher, it will have a very ill opiniou of itself, and sink into a feeling of total nnworthiness. What else but a look of humiliation and self-contempt can be expected in the face of one so trcated? The parent or the teacher may beget in the minds of children, all the rudiments of dignity, manliness, and so much real nobility of sentiment and soul that he would be ahove doing a mean act, however sorely tempted.

Prevention: As in the effort to rcclaim the inebriate, we must look to the awakened moral sentiments, and come under such influences as we know to be right, if we would overcome any mental or phyeical infirmity like that of stammering or of blushing. We must be careful to do juet right between one and another, and between onreelves and our Creator. Then, with a conscience void of offense, and a heart and will in perfect accord with the will of God—loving His service and asking His bleesing on all we do—we shall suffer no more from the smiles or frowne of others, nor be crucified by that crushing feeling of unworthiness which cansee weak sensitive, aud bashful persons to become over-red in the face from a natural or induced tendeucy to painful blnshing.—*Herald of Health.*

Sprains.—Bathe in strong mullen tea salted, or apply brown paper saturated with vinegar; keep the paper wet as long as necessary. Nothing is better than the tincture of arnica; wrap the place with a linon cloth, and keep the cloth saturated with arnica. This is also excellent to prevent risings and boils, and to relieve the pain and inflammation when advanced.

Corns and Bunions.—Burn with canstic, after bathing; repeat, if necessary.

Another remedy: Apply the pulp of lemon until the hard pulp can be removed. Cotton greased with linseed oil or turpentine is very good, it softens the corn.

Quantity of Food to Eat.

People often ask ne "What is the proper quantity of food?" This depends very much on what the food is, and who the person ie, and what his pursuits ars. We doubt not that most people who have the means eat a third more than they really need, and we ventnre the assertion thst if each man of good constitution snd health could hegin at twenty-one, having heen properly fed to that time, he might live to be seventy or seventy five years of age and not need the aid of a doctor at all. We believe that nine out of ten could do so. Bat just how a person ehonld live to avoid entirely all causes of disease, no man, perhaps, is wise enough to prescribe. It may be ssfe to assert that most people who are healthy and hearty eat a little more at every meal than they should. That eense of fulness, that extra heat of tho face, aad the inclination to be sleepy after a meal, show that it has heen too heavy. Most people eat too rapidly, and take in more food than they are aware of. The appetite ie not allayed, and they eat as long as they can hold it, becauee the taste is good.

Suppose one were to eat parched wheat or corn; were ohliged to mesticate it, moistening by the ealiva, having no coffee, tea, or water "to wash it down," he wonld not be likely to eat too much for several reasons, the chief one being, that while eating so elowly, hie stomach would begin to appropriate the food, some of the juicea of the food would he absorbed and carried into the circulation and the appetite would be partially eatisfied hefore he had finished. Moreover, there would he a mechanical eatisfaction on the part of the stomach. It would take a man perhaps three quarters of an honr to eat as mnch of that kind of food ae wonld satisfy him. Then he would get exercise enough for his teeth, so that they wonld he healthy, and all the glands of the mouth would do their work. The etomach would come into healthy action, and the person would he eatisfied ae soon as he had eaten enough. Doubtleee he would eat but little more than half as much in that way as he would to have the wheat ground and made into mush, that could be eaten without the use of the teeth, and a surfeit obtained before the stomach had time to respond.

Persons, generally, who are fat, and are anxious to reduce their flesh, can do so by eating a third lees of food than is their customary habit. Some would have to reduce the amount one-half to bring them to a proper standard. This plan would require self-denial; but people undergo, through self-indulgence, and its consequent vexation and aunoyance, ten times more to mitigate or rid themselvee of tronble than would be nccessary to avoid it altogether.

A lady once came to ue for a phrenological description whose face was thickly covered with pimples, fiery red hlotches, like musquito bitee. Thinking we could hardly do her a better service, we asked, at the close of our phrenological description, if she would like to be rid of those pimples. She started with delight and hope, and said, "Certainly; what ehall I pnt on?" We replied, "Nothing; but eat less sugar and butter, eat lean beef and fruit, and keep clear of griddle-cakes and their accompaniments for three months, and your face will be clear and fair." In one month after ehe came in without a pimple on her face, to ehow us what virtue there was in our simple prescription. She had douhtless been buying cosmetics at a dollar a bottle for years, greatly to the advantage of the dealer. Like the woman of the Soripture, she became no better, but rather worse.

We eat too much. We eat the wrong articles of food. We have pimples, hilious fevers, headachee, dyspepsia, kidney complaint, liver difficulties, and rheumatism. The old rough statement that "men dig their graves with their teeth," has more truth than poetry in it. If men would use their teeth properly, they could postpone the time for having their grave dng for many years.—*Herald of Health.*

Carefulness in Old Age.

An old man is like au old wagon; with light loading and careful nsage it will last for years; hut one heavy load or sndden strsin will break it and ruin it forever. So many people reach the age of fifty, or sixty, or even seventy, measurably free from most of the pains and infirmities of age, cheery in heart and sound in health, ripe in wisdom and experience, with eympathies mellowed by age, and with reaeonable prospects and opportunitiee for continued usefulness in the world for a considerable time. Let such pereons be thankful, but let them also be careful. An old constitution is like an old bone: broken with ease, mended with difficulty. A young tree bende to the gale, an old one anaps and falls before the blast. A single hard lift, an hour of heating work, an evening exposure to rain or damp, a severe chill, an excees of food, the nnnsnal indulgence of an appetite or passion, a sudden fit of anger, an improper doee of medicine, any of these, or other similar thinge, may cut off a valuable life in an honr, and leave the fair hopes of usefulness and enjoyment but a shapeless wreck.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ ysar. Remittances by registersd lsttsrs or P. O. ordsrs at our risk.

ADVERTISING RATES.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Largs advertisements at favorahls rates. Special or readlng noticss, legal advertisements, notices appearing in extraordinary typs or in particular parts of the paper, inserted at special ratss.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 3s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Oct. 26, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Oct. 24, 1872.—Legal Tenders buying, 88⅜; selling, 89. Gold in New York to-day, 113½.

Table of Contents.

ILLUSTRATIONS.—Sewell's Snow Plow, 257. Diagram of the Animal Kingdom, 265.
EDITORIALS.—The Mining Situation; Corrosion of Gange Glasses; Freight Rednced, 264. Notices of Recent Patents; Copper; New Method of Assaying Qnicksilver Ores, 268.
CORRESPONDENCE.—Tunneling in Eureka District, Nevada; Prospecting and Mining—Copper Veins, 258.
SCIENTIFIC PROGRESS.—Soluble Glass as a Detergent; Noctilucine; The Bottom of the Mediterranean Sea a Desert; Rapid Telegrapbing; An Impressive Scene; The Work Done by a Human Heart; Colorstion of Glass by Sunlight, 259.
MECHANICAL PROGRESS.—An Experiment With Paper Car Wheels; Australian Woods; Improved Economy in Iron Manufacture; The Work of the Telegraph; Donkersley's Puddler; Another Monster Ship, 259.
MINING SUMMARY from various connties in California, Nevada, Arizona, Colorado, Idaho and Utah; Mining Shareholders' Directory, 260-1. Market Reports, 268.
USEFUL INFORMATION.—Popular Fallacies; The Matter of Size; Ostrich Farms; Court Plaster; Ink Plant; To Destroy Ants, 259.
GOOD HEALTH.—Blushing; Sprains; Quantity of Food to Eat; Carefulness in Old Age, 259.
MISCELLANEOUS.—Eureka Consolidated Mine; Notes on the Redncticn of Gold Ores; The Cost of Military Systems; The Work of the Coast Survey; Pacific Mail Steamship Co, 266.

TO POSTMASTERS.—The interests of P. Ms. and newspaper publishers are, or should be, mutual. We assist the puhllo in a kindred line. Out of 1,000 P. Ms. we know that 990 are friends of ths PRESS. We do our best to maks them so. They have a regard for respectable nswspapers above that of ordinary merchandise such as is creditshle to both heart and brains. But we regrst to say there are a few exceptions among postmasters in thls respect. There is one, in one of the large towns of ths Stste of Nevada. At his office our papers are thrown into a heap, and subscribers, (if not others) are served with the paper that comes first no matter whose name is on it. We invite that P. M. to correct this. Failing to do so, we invite our subscribers to make a written statement, verified by one or more witnesses, and send to Mr. Barstow, Postal Agent, San Francisco and ask for redress.

SOLICITING AGENTS.—We have traveling soliciting agents and correspondents in the persons of Frank Chapin and L. P. McCarty, who are making the tour of Oregon and Washington Territory, and wherever else they may choose to direct their steps. We commend them to the attention of any of our present subscribers on whom they may call, and the public generally. Any courtesy that may be shown them, in giving them information of the agricultural, manufacturing, mechanical or mining progress and resources of the localities they may visit, either city, town or country, will be esteemed by us and reciprocated by the publication of such facts of interest as may be mparted to them.

OUR report of the proceedings of the Academy of Sciences is unavoidably crowded out this week, but will appear in next week's issne.

COLORADO.—The bullion shipment from Gilpin County, Colorado, amonnts to $135,000 per month.

The Mining Situation.

Our interior exchanges all give a bopeful account of the mining situation in their respective localities, though there is a general complaint of a scarcity of miners. Most probably this want will not long be felt for as winter approaches the numerous prospectors now in the field, will return to the different camps in search of steady employment. When this occurs the mines in want of men will find plenty of them ready for work. Considerable attention is being turned to

Eastern Nevada,

And Schell Creek District in particular is proving itself even superior to what was first anticipated. The *Prospect* says that both that and Ruby Hill District are improving, and the ore extracted from the different mines is as rich if not richer than any heretofore taken out. The McMahon Company are about to erect a 10-stamp mill, and that of the Tehama Company will be completed within a month. The *Prospect* thinks that within two months shipments of bullion will show the outside world that the Schell Creek range can not be excelled. The town of Schellburn is rapidly improving, and like most of its kind in a prosperous camp would hardly be recognized by those who made a second visit in a year after the first discoveries. Several of the mines in the district have been sold to companies at good prices, among which may be mentioned the Silver Wreath, Tehama, McMahon, Woodburn and Great Western. The ore not only from these, but from less prominent mines, is turning out in a satisfactory manner, and Schell Creek District only wants time to prove its worth.

At White Pine everything is about as usual. Rich ore is coming out of the South Chamber from the Lady's Chamber of the Eberbardt & Aurora Company's mine, and from the Belcher Con. Co's mines; good ore is also taken out of the Blasdel works and shipped to mill daily. The indications in the Beecher show, according to the White Pine *News*, that they are upon a large body of ore, which is expected to be developed shortly. At Robinson District the mines are improving as depth is attained. The *News* says, that Ward District, which was discovered about six months ago, situated 18 miles southeast from Robinson, shows rich grade ore assaying from $40 to $400 in silver. The mines as far as developed are looking very well. At Reese River all the miues now running are doing well and look encouraging. The *Reveille* says, however, that Lander Hill is not as lively as it used to be. The Chloriders have nearly all wandered off to other districts in search of something that will bring sudden wealth, and many of the mines are shut down. At

Eureka District.

According to the *Sentinel*. everything is working satisfactorily. The furnaces of the Eureka Consolidated turned out last month about 15 tons per day. The Richmond furnace for the 40 days previous to the 13th inst., shipped about $40,000 worth of bullion. The bullion of both these companies is worth a little over $300 per ton. The Phœnix works since their rebuilding shipped in the first six days 35 tons of bullion, averaging over $400 per ton. The Silver West works 48 tons per day, and averages 8 tons of bullion, worth $300 per ton. The Lemon mill for ten days work shipped 6 bars worth $6,000. Considering that recently all of the furnaces have been undergoing repairs, and that as usual after reconstructing them, they do not for a time work as satisfactorily as after being in operation a few weeks this is a very satisfactory report. The result of the election of the Eureka Consolidated Company will be found in another column. In

Washoe

Considerable prospecting is going on, the strikes on the Crown Point and Belcher mines causing many to start work again on old locations.

On the morning of the 17th inst., the American Flat tunnel of the Virginia and Truckee Railroad caught fire, and before it could be extinguished the timbers were burnt so that a large portion of the work caved in. This has caused serious difficulty in retarding the shipment of ores, etc., and the number of men in the prominent mines has, in consequence, been materially reduced for the present. The Gold Hill *News* says: As a preventative of future fires in any of the tunnels of the road, each of them are to be sheathed or lined thoroughly with sheet iron. The Belcher mine has at last begun to hoist ore through its own shaft. It has for a long time been taken out of the Yellow Jacket shaft, through the Crown Point and Kentuck mines at considerable trouble to all of them. Nothing reliable is yet known of the reported ore developments in the Imperial.

Ely District.

The mines of Ely district, or Piocbe, the most prominent on the coast, except Virginia, are reported as in a flourishing condition and it is worthy of remark that the representative mine there is the only one of all the companies called at the Stock and Exchange Board that paid a dividend this month. The town of Piocbe is the most lively "mining camp" on the Pacific slope and people are coming there daily in large numbers, while just now about 100 new buildings are going up. Strikes are frequent and the place has all the characteristics of a mining town in "flush times." Ten mines are now being worked where one was a year since, and many of those which have not been explored sufficiently as yet to prove their value are being worked constantly with that object in view. The large bullion shipments are a practical demonstration of the value of the lodes, and the nnmber of steam hoisting works, miners, and teams hauling ore to the reduction works, shows the activity that prevails. As usual in snch cases, however, there is one drawback. A serious one too, as a general thing, especially on this Coast. There is more or less litigation concerning validity of title and priority of ownership, not only among the smaller mines but among the more prominent ones also. As an instance of thie may be mentioned the suit between the Kentucky and Raymond & Ely mines. The Kentncky company commenced suit against the Raymond & Ely, a short time since, for $1,000,000 damages. On the 21st inst., the latter company commenced suit against the Kentucky to stop it from further working at the dispnted point. All cases pending bstween these companies will be heard on November 11th.

The District is, nnfortunately, said to be infested with "Soldier's titles" like many in Utah, which are likely to create more and more trouble as the mines are gradually developed and prove their richness. This is much to be deplored as throwing obstacles in the way of mining development and having a tendency to put more "bullion" in the pockets of the lawyers, than in those of the stockholders in the mines. Of course, just now the prominent bullion producing mines are those which feel the effects of these proceedings.

Freight Reduced.

An important reduction in rates of freight has been made by the Central Pacific Railroad Company between this place and Ogden, Utah Territory. A re-classification of goods has been made which is advantageons to shippers and the redneed rates on ores particularly will be hailed with joy by many mine owners. Ore and base bullion can now be sent from Ogden to this city at $10 per ton. The Salt Lake *Herald* in speaking of this subject says that when the excitement was created more than a year ago by the increased freight rate adopted uniformly by the two Pacific Railroad Companies, the lowest figure which miners, mine-owners, and bullion and ore-shippers talked of did not reach a smaller rate than is now named by the Central Pacific Railroad Company. This reduction, if continued, will enable many mines to be worked which would otherwise remain idle and will of course give an impetus to mining operations in that section. Eastern roads have at the same time been advancing rates for freight coming west, so here is a good opportunity for our merchants and manufacturers to profit by the circumstances and secure a permanent trade in the Territory. The Salt Lake papers urge the necessity and benefit of "quick sales and small profits" upon the people of this city, and express a desire to trade with us in preference to the East provided prices are reasonable. The action of the company will no doubt increase the shipment of ore and bullion in this direction as well as augment the shipment from this port to England.

THE GOODWIN PUMP AT THE STATE FAIR—Seemed to attract great attention, and to draw marked admiration for its operative tests. As a new California invention we are especially pleased to note its progress. We are told that important sales of pumps were made by Mr. West, one of the proprietors, at the Exhibition.

Corrosion of Gauge Glasses.

While our correspondent, L. P. Mc., was at Pioche, he was shown some samples of gauge-glasses from a boiler which were rendered useless by the action of the water used for generating steam. Mr. Churchman, Engineer of the Pioche mine, says that he is using a tubular boiler, 11 feet long and 42 inches in diameter; the water for the same is obtained about 12 miles from the mine, and is perfectly clear, with no disagreeable taste. The sedimentary deposit is comparatively little in the boiler, after a run of from six weeks to two months—say, from an eighth to a quarter of an inch of light, friable scale. The water has no perceptible injurious effect on the iron, nor on the brass fittings that hold the guage-glass. The glasses are about 14 inches long, a half inch bore, and put in in the ordinary way, with rubber and lamp-wick packing, and yet after using one a month the upper end is corrugated and eaten to a sharp edge, while the lower one is not affected. The glass is only blown ont once a day, and the water at all times remains as clear as when brought to the mine. There is also a resinous gum that exudes from every rivet leak, or opening, however small, around the man-heads. Mr. Churchman has used these glasses in boilers where the water was highly impregnated with salt and carbonate of lime, and yet, after much longer ussge no perceptible wear could be discovered.

It is most probable that the glass is corroded by the action of hydrofluoric acid, for a dilute solution of it acts upon glass with great facility. Only the concentrated solution acts upon the skin, causing deep and malignant ulcers. In a diluted state this acid is used in the analysis of siliceous minerals, when alkali is to be estimated. It is also employed for etching on glass. The vapor of the acid is also very advantageously applied to the same object in the following manner: The glass to be engraved is coated with wax, and the design traced in the usual way with a pointed instrument. A shallow basin of sheet-lead is then prepared, a little powdered fluor-spar placed in it, and enough sulpburic acid added to form a thin paste. The glass is placed upon the basin, with the waxed side down, a gentle heat applied, which speedily releases the vapor of hydrofluoric acid. The glass is then removed and cleaned, and the lines will be found to be clean and smooth where the pointer has marked them.

This acid may be formed in nature, and act upon the glass in the same manner. The reason why the upper part of the glass only is touched, is probably because the hydrofluoric acid is concentrated and accumulates, while the water evaporates; so it remains on the surface. Hydrofluoric acid, as before stated, does not act on the skin unless concentrated, and only on glass when diluted.

It acts on the metals very slowly, and a long time would ensue before its effects would be apparent. We know of nothing else which would act on the tubes in the same manner without being injurious to the person or to the metals. The manner in which it is formed, of sulphuric acid and fluor-spar, is one which the action of nature might readily perform, especially in a locality where materials abound, and where there are numerous hot springs in the vicinity. Hydrofluo-silicic acid, formed of quartz-sand, fluor-spar and sulphuric acid, would also act on glass in the same manner, but in a less degree, but fluorine, the corroding agent, forms the basis of this as well as hydrofluoric acid, and the action would be the same. This acid might easily be formed in nature as well as the other.

LIBEL NOTICE.—F. H. Fisher, of Nevada, patentee of the "Hydraulic Chief Knuckle Joint and Nozzle," telegraphs us that he will commence suit against R. Hoskins, of Dutch Flat, for libel in the publication of the latter's advertisement of the "Little Giant Hydraulic Nozzle," which appeared in the PRESS last week. Mr. Fisher also warns us to discontinue the advertisement. We certainly do not wish to publish any questionable matter in our reading or advertising columns, and assure Mr. Fisher that the personal advertisement he alludes too will be discontinued in our next issue. It had already been printed in the first forms of the present number when his telegram was received. We prefer that all such quarrels should be settled—as indeed they must be—outside of our columns. Our paper is open for the promotion of all worthy industries, but not (intentionally) for instigating or perpetuating ill-feeling.

Natural History of the Animal Kingdom.

[Continued from page 262.]

cavity. After a while when that animal has acquired the dimensions of two inches, the upper part becomes uneasy and drope off and swims away, and each one of theee layers one after the otber drops off and ewims away; and as it swime away it turns upside down, theee fringee at the margin enlarge into long fringes, at the edge of the central cavity, which were at first only a hollow, are provided with appendagee which hecome in the course of time thoee long appendages; and we have a number, eay twelve, fifteen or eighteen jelly fishes growing ont of thie *polyp*-like animal, which in its infancy is so much like a *polyp* that when first described it was deecribed as a true *polyp*.

Now you see here a history which hringe hefore us the connection between the *polyp* and *acalephs* in the most etriking mannor, and ehowe ue that these animals of a higher clase in their young condition may resemblo those of a lower class to such a degree as to appear to belong to that class, where their relation as infants of this class bas not heen ascertained by obeervation.

Whal Grows Out of an Egg of a Butterfly.

When the egg of a butterfly is hatched it is not a small hutterfly, hnt comes ont a worm-like animal. It ie a caterpillar, and that caterpillar has so much the form of a worm tbat it might readily he mistaken for a worm; for in every respect it has the appearance of a worm-hke animal. It grows to that. You have noticed that in the silkworm, very likely; and you must have been struck by the resemhlance of the young moth which is born from the silk cocoon to a worm. In fact, it is called the silkworm. But it does not remain a worm. After a while it spins itself into a cocoon; that worm is changed into an animal which hae the body divided into two distinct parts —one heing distinctly articulated, aud the other comprising the maesive body. But upon the sides of it you may eee compressed upon the body tbe three legs; upon the eide of it you may see compressed against tbe hody the two winge; npon the side of it you may see compreesed againet the hody the long antennae, and also an organ which ie to be the prohoecie of the moth; and when that hreake through thie envelope it becomes a moth, a perfect insect, with six legs and with two paire of wings. In fact we have a worm-like animal repreeenting the youthful condition of the bntterfly; a *crustacean*-like animel repreeenting its middle age, and in its condition the real insect. So tbat the etages of growth of the ineect recall the perfect condition of animals helonging to the lower claeses.

Here then we eee that the Creator's thonght, by the agency of which these complicatione of etructure which characterized theee different classes were called into existance are repeated in the patterns which animale present in their eucceesive etages of growth. And it shows that it is one kind—some kind of thought pervading the whole. But this is not all. In the order of eucceseion of animale through time we have the eame ideae reproduced. I may add

Anolher Example

In order that I should have eome case from each of the leading groups. The young bird doee not resemble the adult bird. When it ie firet formed on the enrface of the yolk it reeemhles the embryo of the fish eo much that it requires a practiced eye to discriminate and to recognize the characteristic differencee. I have raised turtlee which had at certain conditions presented euch etriking resemblance to a young cbicken that if I did not lahel them I could not afterwards know which was which. So great is the resemblance in the proces of life in theee animale when young, eo different in their adult condition. And I add thie other feature, that animale in the course of time have presented very different characteristics and have exemplified as it were the conditions which we recognize in the growth of animals now addnced, and the conditions which we observe among full grown animale of different etanding.

You may exemplify that in anotber way. Geologists have made ont the history of onr globe to such an extent that we now know that tbere has heen a period in the earth's hietory, when the material elements aggregating or condensing were unfit for the maintenance of animal life; when the mase of the earth was so hot that no water could exist in the fluid condition. hut only as vapor aronnd its envelope; and out of this chaotic condition has grown a etate of things, when the first eruet of the eerth became eolid, and when in the course of time this eolidified crust condensed to such a degree that an ocean could exist upon its serface, and acquire such a temperetnre that animal and vegetable life became a possihility for thie world.

Now these facts aro so well authenticated that there is no doubt in them, wo may say that there ie a horizon at which neither animal nor vegetahle life could exiet, and that helow that are observed thoee

Geological Facts,

Which belong exclusively to the inorganic kingdom. But upon this horizon, animal and vegetahle life originated; and in the couree of time a mighty succession of changee took place; and animals and plante which have lived in succession upon the earth have heen buried in the depoeits formed under the agency of water upon that firet primitive solid crust; and we call geological periods those euccessive etages in which a divereity of animale and plants are buried, and these stagee, these enccessive levele in the eolid envelope of the earth have received names. We call *azoic* all thoee deposite which underlie the forms where animal and vegetahle life begins; and then we have theee geological eyeteme which I will repreeent by horizontal linee, which have followed one another up to the time when the condition of thinge was introduced which now prevail. We have here helow what eome geologists have called the *Taconic* eyetem, or *Cambrian* system, or *Primordial* eyetem. We have above that the *Silurian* syetem; we have above that the *Devonian;* above that the *Carboniferous;* above that the *Permian* system; then we have the *Triassic*, the *Jurassic*, the *Cretaceous*, the *Eocene*, *Miocene*, and *Pliocene* periods, and the present state of things.

And in each of these periode we have animals and plants which differ from one another ae they differ from thoee now living. And now let us see in what order animale have arieen upon earth. It is not true that only the lowest made their appearance at firet. We have from the heginning *polyps*, and through all timee, We have from the beginning *acalephs*, and through all times. We have from the beginnfng *echinoderms*, and thronah all timee. So it is impossible to consider these animals which at all times have heen contemporaneous with one anotber as the ancesters of one another; or no contemporary ie the anceeter of another. We must have there a difference of time; and we see that here we have representatives of theee threo classee from the beginning, and among *mollusks* it ie tbe eame. We have *acalephs*, from the beginning and through all times. We have *gasteropods* from the beginning, and through all times. We have *cephalopods* from the beginning and through all times. And we have the *articulates* aleo from the heginning. We have *crustacea* from the beginning, and through all times. But not ineects; inseets helong in tboee periode which are more closely connected with the *carboniferous* age; end then once introduced continued through all timee to the present day. Now certainly not one of theso ani mals can he derived from those.

ECHINODERMS. ACALEPHAE. POLYPS.

ACEPHALA. GASTEROPOD.

BACKBONE OF FISH. FISH CHANGED INTO REPTILE.

WORM. CRUSTACEAN. INSECT.

RADIATES.	MOLLUSKS.	ARTICULATES.	VERTEBRATES.
Echinoderma.	Cephalopods.	Insects.	Mammals.
Acalephae.	Gasteropods.	Crustacea.	Birds.
Polyps.	Acephala.	Worma.	Reptiles.
			Fishea.

No one of these can he derived from them. Perhaps insects might—if it could be shown that they are really the decendants of any of theee older forms of *articulates* known as *trilobites* all alike.

How is it that in *vertebrates* we have in the opinion of some—and here I will show you

How Difficull it is to be Positive

At timee—in the opinion of eome naturaliste we have fishes from the beginning to the present time; in the opinion of others, fishee do not begin before the *Devonian* age. We may eay: "Well, are naturaliste so ignorant that they cannot recognize a fieh from another animal?" The difficulty is greater than it appeare, for we do not find the remaine of thoee animals ae perfect specimene, ae complete as we find the fieh in the market. We find eome of ite parts, of its hones,—what are the remaine of fieh or the remains of *vertebrates*, which have heee found there—epines and teeth. Now the spines of such fish may resemhle the spines of eome *crustacean*, for instance, of the king crab. The teeth are euch as to resemble those which are found in the cupe of the arms of cuttle fishee; and in consequence of that there are naturalists who say tbat the fishes, which are eupposed to have lived then, were cuttle fiehee; others who say that they were *crustaceans*. The certainty will he ascertained, when we have better epecimens, which will he nnmistakable, or when thoee spinee and those teeth shall have been examined in such a way microecopically as to leave no douht that the teeth are hona fide teeth of fieheo, and not the cupe of cnttle fish, and the spinee are hona fide the spines of fieh, and not possibly the epinous appendages of some king crab.

And even that investigation is very difficult owing to the circumstanoe that most of those animale of an older time differ, not only entirely from those of another period and most from thoee which live now, but reeemble one another in the seme period to a considerable extent; eo much eo that the *Silurean crustacea* or the *Devonian crustacea*, have been mistaken for a time for fish, or vice versa. And now comes the point when we have difficulties among ourselvee, which no doubt are exaggerated by the community, when they helieve that we have no eolid knowledge of all other departments of our science.

To know when the uncertainty hegins and when the certainty may be reached, requires a conciderable familiarity with the whole, as in every department of knowledge! And what is the representative field that the numher of those who are competent ehould he increased, that the number of those who have acquired familiarity with this subject should be so great thet real information ehall be rap dly made precise? It is in consideration of this desirahle state of things that I appeal to you to

Foster all Efforls

Which are making toward the fostering of science, and you will see that this knowledge goes much further in its consequences than appears at the surface. I have presented to you these things as facts, hut they are more than facts; they are indications of something superior. If these animals are related to one auother in the manner in which I have presented, in consequence of a plan, there was thought that laid out the plan. There wes a mind that determined thie plan. In fact, the whole animal kingdom is the work of intelligenee. But if these things are derived one from the other. they may be, and they are repree eeuted so by a school of naturalists at the present day; they may be the work of blind forces, of forces without intelligenee, without discriminating power, and without forethought, and you see at once that

The Study of Nalure

Is every day encroaching not only upon philosophy bat upon our very creeds; and the day will come when all thinking men will appeal to the facts of nature to determine whether we onrselves are descended from monkeys or whether we are the work of a beneficient Father. Now it will no longer do for the coming generatione to eay, I will accept this or that doctrine, because knowledge is pressing at your halls and will say to you, you may know it becauee you muet know it, and nnlese you are willing to learn it you may grope in ignorance and be the tool of a designing priesthood. That is the condition that staree us in the face for the future, and it hecomes the duty of every man to foster knowledge and to prepare the coming generation with all those appliances which lead to an independent opinion on all those matters. But there is another consideration than that of your immediate necessitiee here. No community can be utterly great without

Culture.

Culture is the hackground of every great community. It ie, in fact, the true and only teet of real greatneee, and history admoniehes us in the moet pregnant manner that this is true, and that the fate of natione depends upon their culture. Compare States that have gone out of existence, as Athene and Carthage, that have hcen drowned in the course of time. Compare them in the memory of mankind. Carthage, that powerful Carthage, which made Rome tremble, what has she left? A pile of ruins, the position of which is hardly known, and nothing else which could benefit mankind. Little Athene, the model of all culture! from her we have learned eloquence, poetry, philosophy—the arte. If anything ie great we try to make eure that it will compare with Athenian culture. Will you allow your community to share the fate of Carthage, or will you show that all your luxuries and good fruits shall be embellished by Attic salt in the future? It ie for you to decide.

Eureka Consolidated Mine.

An adjourned meeting of the shsreholders of the Eureka Cons. M. Co., was held on the 10th inst., when it was expected that a new Board of Trnsteee would be elected instead of the present one. A nnmber of tbe shareholders deeired this change in msnsgement, believing that the Truetees were not carrying on sffairs to the best intereets of tbe compsny. The furnaces and mines of tbe corporation have been under way for a long time and with apparent succeee, while for more than a year no dividends hsve been paid. The principal cause of complaint appeared to be that large quantitiee of chsrcoal hsd been purchased at 32 cents per buehel, when it was selling at 28 cents, and cord-wood bougbt at $8 per cord, when it could be obtained for $6. There was a week or so ago about 600,000 bushele of chsrcoal on hand at tbe furnscee, which would have been sufficient to run them throngh the sesson of bad rosds, and the rosds in that locality will probably be good for two months to come. The shareholders see no reaeon why a large expenditure should be msde for charcoal when there is no immediate necessity for it, and there is a large stock on hand, especially when a price above the market value is paid for it. Tbey think it about time to see a dividend.

Cbarcosl too, as is well known, deteriorates with time, and if the qusntity on hand was as large as represented, and an exorbitant price wse paid, the ehareholders certainly have just cauee of complaint. There is no use in a dividend being tied up in a lot of charcoal for six months or a year. The failure on the part of this company to pay dividends has been a serious drawback to Enreka District, it being the representative one. At the meeting in question the committee appointed to nominate Trustees, put in a ticket, but most of the old Board were re-elected, as follows: W. W. Lawson, (re-elected), Thomas Bell, (re-elected), Wm. Thompson, (re-elected), Capt. W. H. Osgood and James Findla. The two latter took tbe places of George Hearst and Lloyd Tevis. We are glad to see the sharebolders of mining companies standing up for their rights wben they think they are being abused. A few wholesome lessons will be remembered, and will serve to remedy many evils in the future. In this instance tbe old Board was re-elected, it is true, but they will no doubt have hereafter, more consideration for tbe wishee of stockholders. If more shareholdere would take an interest in the *mining* department of their companies, and not so much in the fluctuations of the stock, a great improvement would be made, and more care taken by trustees and officers in their management.

The following statement is condensed from the report of the Secretary:

RECEIPTS.

Proceeds 3,019 tons base bullion refined, including 1,430 tons last year's product	$1,169,609
Approximate value 1,981 tons base bullion at refinery works, Newark, New Jersey, and en route	641,160
Exchange on coin drafts	3,626
Reclamation for over charges on freight	1,273
Miscellaneous	1,062
Total	$1,806,530

DISBURSEMENTS.

For construction and improvements	$ 54,959
Mine account	261,803
Smelting account	680,330
General expenses, Eureka	41,299
Expenses at San Francisco	11,901
Interest, etc	23,126
Freight and refining, etc., on bullion	269,101
Office fixtures	76
Dividend No. 6 paid to stockholders	50,000
Real estate, Eureka	1,600
House for use of assayer	1,200
Wood ranch	719
Mining property	2,023
Bills payable	26,000
Book accounts	683
Total disbursements	$1,402,819
Balance value of bullion on hand Sept. 30, '72.	403,711
Total	$1,806,530

RESOURCES.

1,981 tons base bullion	$641,160
Charcoal on hand	160,666
Supplies at Eureka	6,116
A. M. Ellsworth, Superintendent	1,714
Total	$798,656

LIABILITIES.

Drafts against bullion shipments	$328,589
Overdrafts	169,328
Superintendent's drafts not presented	9,569
Book accounts not due	8,376
Bills payable	76,000
Total liabilities	$590,861
Net resources	207,795
Total	$798,656

Lees & Waller, at New York, advise by letter that the amount standing to the Company's debit on the 1st day of October, 1872, was $113,586. The product of the mine for the year was 3,570 tons baee bullion, of which 1,589 tons have been refined, yielding $608,340, leaving a balance on hand of 1,981 tous at refinery works and en route, valued at $641,160, making the total yield for the year $1,259,500, or $153,320 less than tbe disbureements. The average cost of extracting the ore for the year has been $784, while the cost of smelting has been $18.33 per ton.

Notes on the Reduction of Gold Ores.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

[Gontinned.]

In all mining countriee where attention has been give to the saving of tbie gold, tbe plans tried were first directed towards treating the tailings in bulk, by re-grinding and amalgamating, or eome anslogoue plsn; but from the fineness of the gold it must be evident that tbe reduction of *all* tbe tailings to such a gauge as would allow tbe pyritoue gold to be liberated, could only be effected at an expense grester than the value of the gold tbat would be obtsined. Such grinding as can be practicslly given to it by the best machines known, has extrscted abont one-tbird of the gold contents, and thie at euch a coet as to leave only a emall msrgin for profit, unlese the tailings wore exceptionally rich. Even in the latter case, they they will probably contain such a percentsge of eulphides as wonld msterially affect the amalgamation, and thus bring up another objection. Ae, however, it appears tbat with good arrangements for extracting tbe free gold, tbe bulk of the gold lost is only that enveloped in tbe sulphides, by separating tbe lstter from the worthless ssnd (and in doing this most of the free gold escaping would be retained also), we obtain tbe gold in a small quantity of rich material that will pay for the more costly processes reqnired to extrsct it. By this means, probsbly nine-tenths of the wortblese sand, and the cost of operating on it, will be got rid of, and the one-tenth retsined will consist of sulphides, and particles of quartz ssnd enveloping gold, of a small proportion of free gold, and more or leee eand not containing any gold,—the quantity of the latter depending on the efficency of the concentrating process used, snd to the extent to which it ie carried.

The greatest advance which has hitherto been made towarde the saving of the pyritous gold has resulted from tbe following up of this system, although before bringing it to perfection tbere are still some difficulties to be surmounted. The principal of these is the complete concentration of tbe sulphides from the wortbless sand.

The specific gravity of the quartz is about 2·6, and that of iron pyrites (our great gold bearing ore) is about 4·7, this amall difference offering great obstructions to their perfect separation, as all persous acquainted with practical ore-dressing will at once perceive. But this difficulty is increased through the pyrites being eo much more friable than the quartz, great part of it being in consequence crushed into a fine powder, which cannot be separated from the sand by any of the common ore-dressing machines now in use.

The eulphides hitherto operated on consist of the larger particles retained on the blanket strakes, or separated from the waste tailings by means of Mr. Munday's patent buddle. But even this amount of saving is well worthy the attention of mining companies, as the results obtained at the Clunes works for some years past prove* beyond a donbt, seeing it would add at leaet £300,000 per annum to the returns from our quartz mines, and by doing so, double the profits derived from them. There is now, however, a certainty that the concentration may be carried much further than it has hitherto been, by means of the improved percussion table.†

Tbe system adopted for the treatment of the sulphides is simple and easily understood, being merely the elimination of the sulphur and arsenio, and the conversion of the iron into an oxide, so as to liberate the gold, and allow mercury to be used for its extraction.

A plan baeed on the same principle was long used for dealing with the pyritous ores of North Carolina and South America. Tbe ores were first crushed, and the gold thus liberated taken out; they were then exposed to the action of the atmosphere for a year, to allow of natural decomposition and oxidation, wben tbey were again re-treated; the gold obtained in the second operation being nearly the same amount as in the first; and this was repeated for four or five years, by which time the gold was exbausted.

By the plan now followed, instead of waiting for four or five years for the oxidation of tbe sulphides, the process is completed in two hours in an oxidating furnace.

If the pyrites is brought up toa dull red heat, in an open vessel or furnace, the oxygen of the air will combine with the sulphur, arsenic, and iron forming the pyrites; the two firet constituents pass off in the form of sulphurous and areenious acids, and tbe iron will be converted into a brown or red oxide. This change can be effected in the ordinsry reverberatory furnace, but the time and labor expended in raking over the material until every portion of it has been exposed to the action of the air for a sufficient time to ineure its decomposition, renders this a elow and coetly procese. The oxidating furnace uow in use at Clunes (designed by Mr. Latta) remedies tbese defects. In this, the fire is applied in a similar way to that of the ordinary reverberatory furnace, but provision is made for throwing in a superabundance of heated air. The bed is from tbirty to forty feet long, and from five to eix feet wide, set at an angle of about twenty degrees, and there is an opening for the discharge of the roseted sand, between the lower end of tbe bed and the bridge of the furnace. It ie fed at tbe upper end, and the material is gradually raked down the inclined bed, whicb is thus kept covered with a tbin layer of sand. In traveling down tbe bed, every portion of the sand is exposed to the action of the air, and it is found thst abont two hours exposure in the furnsce is sufficient to allow of the complete oxidation of the pyrites. The action is continuous, small charges of tbe raw msterial being fed in at the upper end, to eupply tbe vacancy caused by the drawing off from tbe bottom. A dull red heat is found to be the most effective, and the sand is quenched with water as it leaves the furnace.

The gold is still for the most part enclosed in the particles of oxide of iron, and a grinding process is required to liberate it, and facilitste its absorption by tbe mercury. The plan hitherto used is to grind the moistened sand under broad-faced Chilian rollers, in chargee of two hundred pounds weight each, with one bundred pounds of mercury. The latter ie broken up, and dietributed tbrough tbe moist sand in myriads of small globules, thus bringing it into contact with the minute particlee of gold. After this grinding snd amslgamating has been carried on for half-an-hour, water is sdmitted, and the mercury collects together again. The ssnd is then flushed into a cistern, and the mill recharged. From the cistern the esnd is run through concentratore, for the purpose of collecting the finely-ground mercury which passes off with the sand from the mill.

Taking the average of the last twelve months' work at Clunes, eighty-six per cent. of the totsl gold contents of the pyritee treated wae obtained by thie means, and it is probable that considerable improvements will yet be made.

One of these would be the grinding of the roasted sand to a fine powder previous to amalgamation. In tbis way a more thorough disintegration of the sand would be effected than is practicable in tho mill, and the surface of the gold would be burnished, eo as to restore its affinity for the mercury, injured by the heat to which it had been subjected. This plan will shortly be tested.

The syetem of extracting gold known as Plattner's process, from its having first been brought into practical operation by him at Reichenstein, in Germany, is founded on the affinity of chlorine for gold. The ground ores are first roasted, and tben put into shallow vessels with a falee bottom. The chlorine gas is obtained by putting the proper equivalente of manganese, common salt, and sulphuric acid, into a generator, and when heat is applied, the gas is evolved and conducted under the false bottoms of the cisterns. When the latter are fully charged with gas (whicb may be know from its risiug through and resting on the sand) they are closed up for from twelve to thirty-six hours, to allow time for the combination of the chlorine and gold. The chlorine of gold formed being soluble in water, it is dissolved out of the sand, and tbe gold is then precipitated from the solution by the addition of sulphate of iron. If this process is carefully conducted, nearly all the gold will be obtained. The labor attending it is not great, but tbe cost in this colony of the chemicals required has hitherto been the great objection. This cost would be mucb reduced if tbe mannfacture of sulphuric acid from tbe sulphides were combined with the extraction of the gold, and the formation of an establishment for this purpose, iu a central position, would be attended with great benefit to the quartz miners.

Many attempts have been made to extract the gold from the sulphides in their raw state, for the purpose of avoiding the cost of eliminating the sulphur and arsenic by roasting. But even with the uee of sodium amalgam and other chemicals, the triale hitberto made have not been attended with satisfactory results up to the present time. Fine grinding in mills or barrels with mercury alone will not extract a fair proportion of the pyritous gold. Still, many of our crushers keep trying this plan; and having extracted a part of the gold, at once jump to the conclusion that they have obtained it all, or nearly all. Unless these trials are properly conducted, tbey may lead to much useless expenditure, and to the formation of opinions having no sound basis to rest upon, but which may have a most injurious effect in delaying substantial progress. Before any trust can be placed in such experiments, the character of tbe gold to be saved, and the percentage that can be extracted by the processes now in use, should be known. Tbe exact amount that can be obtained by the new plan, and that still left in the sand, will then give the data requisite for making a fair comparison, and show if any advance has been made. It might be supposed that to advocate such an obviously necessary precaution is hardly required; yet through neglect of it large eums of money have been thrown away, and the false opinions and prejudices it has fostered offer no trifling obstacles to the dissemination of correct views.

[To be continued.]

* The retnrns from tbe Clunes works, of the working of tbe pyritous ore from their waste tailings, for the year ending September, 1867, were as follows:—

268 tons of concentrated material operated on, containing, by assay, 3oz. 9 dwt. 3 grs. of gold per ton.

Amount of gold extracted, 795 ozs. 8 dwts., or 2 ozs. 19 dwts. 10 grs. per ton, being 86 per cent. of the total gold contents.

Cost of operation, £800 4s., nearly £3 per ton, or £1 0s. 1d. per oz. of gold obtained. Profit, £2,369 3s. 9d.

† Since these notes were written further improvements bave been made in tbe working of the patent buddlo.

GAS WELL.—The gas well discovered at Salinas City some few weeks since, having been closed up for a few days, opened on the 18tb, inst., and continues to throw gas, stones and water with the same force it did at first. It was again ignited and proved to contain all its previous good qualities. The gas will probably be utilized in lighting the town.

The Cost of Military Systems.

The Berlin *Post* presents some interesting figures ehowing the etrength of tbe armiee at tbe command of the three emperors who lately met in council in that city, and thoee of otber European powere, wbich msy be briefly summsrized as follows: Kaiser Willism has 1,052,506 men; the Czsr of Russis hss, not inclnding the Coeescke, 1,362,464 men; tbe Emperor of Austria bas 963,050 men; Frsnce bae 505,537 men under arms; Itsly hae 501,977 men; Englsnd, 154,000 men; snd Belgium, Holland, Denmark, Spain and Turkey togetber, 981,364 men. Tbus we have the enormous totsl of 5,520,898 men who make arme a profession. Tbeee men, in the prime of life and tbe full development of strength and cspscity for lsbor, are not only witbdrawn from useful production to live in idleness at tbe expense of the State, but tbeir maintensnce and equipment must give conetant employment to many thousande of producere wboee labors can thus contribute notbing to the welfare of the community; and when we coneider the value of the producing capacity which is thue practically wssted, we csn gain eome idea of the burdens imposed upon labor and cspital for the maintenance of military eetablishmente. Fortunately, ware are becoming so coetly that nstions will not long be able to afford to engage in them, and we tbink the time is not far dietent when the people of all countries will demsnd that the burden of standing armies shall be forever lifted from their patient shoulders. Tbe world has too many uneupplied wsnts to long tolerate the needlese withdrawal of millions of strong and intelligent men from production, that kings and emperors msy play at war.—*Iron Age.*

THE WORK OF THE COAST SURVEY.—Professor Benjsmin Pierce, Superintendent of the Cosst Survey, hss submitted hie annual report to the Secretsry of tbe Treseury. In all the northern sections parties are yet in the field, and will so continue until the approach of winter, when transfers will be made for resuming operations in the southern sections of the coast. Surveying parties are now engaged either in triangulation, topography or hydrography on the coast of Maine. Special astronomical observations bave been made at Cambridge, Maes., to determine the precise relation in longitude between points in the United Statea and points in Europe. Special examination has been made to verify the sailing direction for the harbor charts of the coast of New England. The tides have been recorded constantly during the year at North Haven, in Penobscot Bay, and at tbe Charlestown Navy Yard. The Plane Table snrvey of the coaet of Rhode Island is in progress, near Perrysville, west of Point Judith, and also the detailed eurvey of New Haven Harbor. Special hydrographical investigations are in progress in Now York Harbor and the adjacent waters, and the tides have been steadily recorded at Goveruor's Island. Field parties are completing the shore line survey at the eouth end of Lake Champlain, and others are sounding its northern branchee. Professor Pierce reviews at some length the work done along the coast, and eays tbe magnetic elements have been determined in the vicinity of Philadelphia and at Washington, D. C.; tides have been regularly recorded at Old Point Comfort, Va.; a geodetic reconnoiesance ia in progress near Harper's Ferry; the detailed survey of James River, Va., has been extended npward to Warwick River; twenty new charts have been published during the year, and nine others, wbich show extensive additions, in comparison with their first iseue, and tide tables for the ensuing year, have been prepared, and will be published as heretofore.

PACIFIC MAIL STEAMSHIP CO.—There are twenty-five steamships owned by this company, employed in the Pacifio trade. Running between this port and China are the "Alaeka," 4,011 tons; "Colorado," 4,009 tons; "China," 4,350 tons; "Great Republic," 4,000 tons, and the "Japan," 4,351 tons, one of which is despatcbed on the 1et and 16th of eacb month. In the Panama trade there are the "Arizona," 2,793 tone; "Conetitution," 3,575 tons; "Montana," (sidewheel) 2,676 tons, and the "Sacramento," 3,682 tons, one of whicb leaves the docks on the 7th, 17th and 27th of each month. The "California," 1,057 tons, is in the Mexican trade, and the "St. Lonie," 1,771 tone, in the Central American. Four steamehipe are kept in the inland China seas, the "Golden Age," 2,838 tone; "New York," 2,217 tons; "Oregonian," 1,814 tons, and the "Costa Rica," and there is also a "Costa Rica" stationed at Panama. The other steamships of the company on this ooast are the "Ancon," "Montana," (screw) "Gautemala," "Honduras," "Salvador," and "Winchester," while in the San Diego trade, plying five times a month, are the "Pacific," "Orizaba," and "Senator," and on the 12th an additional steamer leaves for Guaymas, near the head of tho Gulf of California.

IMPORTANT TO MINING INCORPORATORS.—In incorporating a company in this State to mine in the State of Nevada, besides the certificate filed in the office of the County Clerk and a certified copy sent to the Secretsry of State of California, the laws of Nevada require that a certified copy shall also be filed with the Recorder of the precinct in which the mine is located. The officers of Nevada are now strictly enforcing this provision of the law, and bnt few persons appear to be aware of the fact, aa only one copy of the original certificate is nsually for certification to the County Clerk of this city.

THE LITTLE GIANT HYDRAULIC NOZZLE

IS FAR SUPERIOR TO ALL OTHERS.

Many persons have been deterred from purchasing by the representations of Mr. F. H. FISHER, that the LITTLE GIANT is an infringement on his patent. The statement is utterly false. Said Fisher was tried and convicted and fined for infringing on one of the patents embodied in the LITTLE GIANT. He has again transgressed, and will soon have to appear for sentence, and the parties who purchased of him will be attended to in due time.

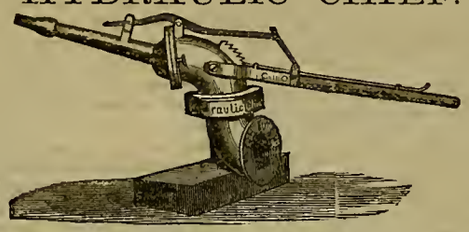
The Little Giant was Awarded a Special Premium of a Silver Medal
AT THE STATE FAIR OF CALIFORNIA IN 1872.

I manufacture Machines of all sizes, and am sole licensee and manufacturer under Craig's, Masey's, Rice's, Allenwood's and Hoskin's Patents. I will fully protect my patrons from any or all others. Send for Circular, containing testimonials, etc., to

R. HOSKIN, Dutch Flat, Cal.
August 7, 1872. 15v25-tf

HYDRAULIC CHIEF.

FISHER'S KNUCKLE JOINT AND NOZZLE IS THE Cheapest and Best Hydraulic Machine in use.

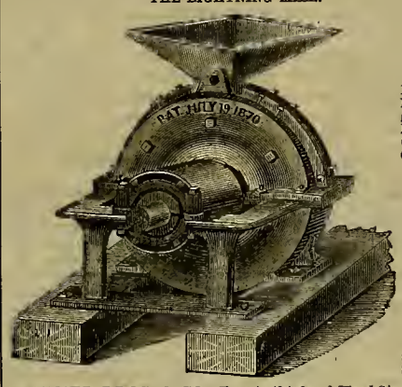


MACHINES Manufactured TO ORDER, to throw from One to an eight-inch STREAM.

The only reliable party in the Hydraulic business who protects his patrons.
9v23-tf Address F. H. FISHER, Nevada, Cal.

HYDRAULIC MINERS, TAKE NOTICE—I hereby caution Miners and Manufacturers against making, buying, selling or using a Hydraulic Machine or Joint known as the Little Giant, manufactured and sold by R. R. & J. Craig and Richard Hoskin, as the same is an infringement upon the invention of the machine known as FISHER'S HYDRAULIC CHIEF, secured by Letters Patent, No. 110,222, dated Dec. 20, 1870. All parties participating in such infringements will be rigorously prosecuted. Nevada, Jan. 13th. F. H. FISHER.

THE LIGHTNING MILL.



THE
LIGHTNING MILL,
For Pulverizing Quartz, "Charleston Rock," and all Native Phosphates, Flint, Feldspar, Iron Ore, Manganese, Antimony, Carbon, Corundum, Old Crucibles, Barytes, Brimstone, Slate, Soapstone, Graphite, Glass, Marble, Plaster, Anthracite and Bituminous Coals, etc.

WM. STEWART'S
Patent Bone Mills and Crushers.
For Grinding Bones, Rock, Quartz, and all hard substances; also, Corn, Wheat, Oats, Barley, Coffee, Spices, etc.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For Week Ending September 24th, 1872.*

Dredging-Machine.—Andrew J. Gove, S. F., Cal.

Rouleau-Envelope.—Andrew J. Gove, S. F., Cal.

Ore-Crusher.—William P. Hammond, Napa City, Cal., assignor to himself and Henry Mygatt, same place.

Combined Water-Wheel and Sewing-Machine.—Isaac Hyde, Oakland, assignor to Oscar J. Backus, S. F., Cal.

Car-Brake.—James Charles Gibson, Sacramento, Cal.

Traction Locomotive and Railway.—William B. Hyde, Oakland, Cal.

Washing-Machine.—John S. Ord, Soquel, Cal.

*The patents are not ready for delivery by the Patent Office until some days afterward.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Mining and Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Quicksilver and Amalgam Saving Apparatus.—Joseph Potts, Treasure Hill, White Pine, Nevada. This invention is called an Electro-Galvanic Quicksilver and Amalgam-saving Apparatus, and is intended for that purpose in mining operations, more especially to save that portion which usually escapes down the sluices on account of its fineness or state of minute sub-division. This is accomplished by passing the pulp or tailings through a sluice or section of a sluice, which is provided with peculiarly-arranged riffles, the pulp or tailings being first distributed upon the floor or bottom of the sluice-box by means of a revolving hopper of novel construction. The riffles are made of copper, and riveted to the bottom of the box at an angle of 30°, and extend lengthwise of the box. A space of about one inch is left between the riffles in each row, of which there are ten. The riffles in each alternate row are riveted between the spaces of the upper row, so that there are five rows containing five such riffles, and five rows containing but four. In another box are another series of riffles, which run across the box, and are set at the same inclination as the box itself. On the upper side, these riffles are separated so as to allow the quicksilver and soft amalgam to pass through and finally run into the vessel for receiving it. The lowest riffle is not perforated, and the main quantity of water and sand is allowed to pass over it into the sluice below. The boxes, riffles, etc., are all coated with amalgam, and the copper boxes are enclosed in others of zinc. So, in the admission of tailings or water, however slightly acidulated, a galvanic action is set up. The whole apparatus may be enclosed in a wooden box, and kept under lock and key. The apparatus receives the tailings at the upper end in a hopper or revolving wheel. The tailings are thus distributed along the course of the riffles, and finally discharged from the sluice. In passing through these boxes and over the riffles the tailings are subjected to a galvanic action, which adds intensity to the volume and favors the amalgamation of the particles. The whole apparatus is charged with an additional current of electricity by ordinary batteries.

Coin Envelope.—A. J. Gove, S. F., Cal. This little device will be appreciated by all Californians particularly, as it is an envelope, wrapper or package for containing silver coin in specific quantities, and especially silver half-dollars, in order to render them more convenient for handling as a commercial medium. Wherever silver in large quantities is used as a currency medium, and especially upon the Pacific Coast, where there is a superabundance of silver half-dollars, whatever lazy men may say to the contrary, it is customary, for the sake of convenience, to make what is known as "silver rolls," each of which usually contains forty half-dollars, thus making them into packages of $20 each, known as $20 rolls. The usual way of confining these pieces of silver in a roll is by means of a piece of paper, in which the roll is wrapped, thus concealing the contents of the package, and as the roll generally passes as current without examination, a chance is offered for dishonest persons to concoct fraudulent rolls. Numerous instances have occurred in which a piece of iron tubing was inserted in the wrapper, instead of the pieces of silver, and others in which counterfeit pieces were introduced with the genuine silver, thus perpetrating a fraud upon the public. This invention is a wrapper which can be very cheaply made, and through which the contents can be examined without unfolding the package. It is constructed of a piece of card-board or other stiff wrapping material, which is cut the exact length desired to have the coin-roll, and wide enough to extend almost around the roll. The space between the two edges forms a slot the entire length of the roll, through which its contents can be examined without disturbing the wrapper. The edges are bonnd with strips of metal, made of waste pieces of tin or other metal. One or both ends of the wrapper can be removed by turning one end slightly; and then it can be used over and over again. It can also be used as an advertising medium, since advertisements can be placed upon it.

Self-Acting Brake. — Timothy Stebins, S. F., Cal. This invention provides an automatic brake or governor, which is more especially intended to be used in connection with elevators, and it consists in the employment of two or more shoes, which rotate within a stationary rim. These shoes are so connected with their axle that any increase of speed beyond the desired point will cause the shoes to move outward, so as to rub against the rim with more or less friction, according to speed, and thus retard the motion of the shaft and anything which may be connected with it. Suitable springs are connected with the shoes, and by their tension the speed of the machine is determined, as when the centrifugal force overcomes the spring the shoes are thrown against the interior of the rim, checking the speed.

Improvement in Belt-Shifters. — Samuel Forsythe, S. F., Cal. This is designed to improve that class of shifting devices in which a cylinder provided with cam or spiral grooves is employed for shifting the hlooks which carry the belt. It provides a spring-guard, which will limit the rotation of the shaft at certain points, and thus indicate when the belt has been properly placed, without requiring further attention from the workman.

Axle-Box. — Jonathan S. McClure, Sacramento, Cal. This improvement is more particularly applicable to the boxes which support the journals of railroad-car axles, but can also be used in boxes of all kinds which are likely to become heated by the revolution of the journal. A water-tank is attached to the box in such a manner as to keep the box cool and prevent it from being overheated by the friction of the journal; and there is also a novel arrangement for supplying oil to the journal for lubricating purposes. The arrangement is simple and easily applied to the ordinary axle-boxes of railroad cars. The same application can be employed on the stationary boxes of machinery for the same purpose and with equal benefit. The axle-boxes are connected with a water-tank by a pipe and a circulation of water is maintained between the part of the axle-box required to be kept cool and the tank as the water becomes heated.

Medicated Towel.—Lydia Stewart, S. F., Cal. This is rather a novel method of applying medicine externally to the human body, by means of an ordinary towel. The towel is to be used for drying the person after bathing, and, it is claimed, will arrest cutaneous diseases, paralysis and local affections, while it imparts at the same time a healthful action to the skin and frees it from bad humors. A towel, prepared in the manner specified, will retain its virtues about two months, when the process will have to be repeated.

Copper.

The price of copper has a downward tendency at present, although there seems to be some doubt and uncertainty as to its future position. In England the market is not at all steady and prices vary greatly from day to day.

The recent decline was quite rapid and must have made uncomfortable those who had prepared for the opposite to occur. Consumers and speculators are both, however, deterred from operating on any extensive scale owing to uncertainty of future prices, and the amount likely to be put upon the market. Lewis & Son's Liverpool report of ores and metals for October, explains this sudden depreciation as having been partly caused by the failure of numerous weak speculators to carry through their engagements, necessitating the sale of their purchases as the prompts fell due; partly by the advantage taken of this fact by smelters to accelerate the fall in values by reducing their quotations for English copper; and partly by the prospect of dear money.

There is now no stock of Chile ore or Regulus in London, and importers have withdrawn all parcels to arrive entirely from the market, declining to sell at the low prices. The high price now paid for coal there is equal to an additional cost of 1s. 6d. per unit on smelting ore of 20 per cent. produce; ore and regulus have therefore no longer the same value per unit and the comparative value of regulus and bars is also changed. Chile exports to 2d of September were 37,957 tons fine against 28,451 tons at same time last year. Stocks of west coast produce were estimated at 20,125 tons fine against 18,860 on the 1st of September. Latest quotations according to Lewis & Son's Circular were £82 to £83 for good ordinary brands Chile bars, and £90 to £91 for Wallaroo, 16s. 6d. to 17s. per unit for regulus, and 16s. to 16s. 6d. for ore of 20 per cent. produce.

New Method of Assaying Quicksilver Ores.

In the Mining and Scientific Press, of April 13th, 1872, we gave a new method for the very exact determination of the amount of quicksilver in retorted amalgam and quicksilver ores by means of a gold-cornet in a small scale. This method was practised and published by Mr. Kustel. A similar method, that is depending on the property of gold to absorb the quicksilver vapors, has recently been discovered by A. Eschka, assayer in the General assay office at Vienna, and is performed in the following way:

The ore is pulverized fine and weighed out; of poor ore, containing only up to one per cent. of quicksilver, 10 grammes is taken; that containing from one to 10 per cent., five grammes; from 10 to 30 per cent., 10 grammes; and above 30 per cent., only one gramme is weighed out. The ore is introduced into a porcelain cup, with a level, ground edge, and then mixed with half of its weight of pure iron filings, by means of a glass rod, and the whole covered with iron filings. The cup is then covered with a concave cover of gold, the edge of which fits perfectly that of the cup. The weight of the cup-cover must first be noted. The concave cover is filled with distilled water and the cup heated by a flame, the point of which surrounds the lower part of the cup for ten minutes.

This time is sufficient to volatilize all the quicksilver, which is taken up by the gold cover. This is removed by the fingers, the water poured off, and the convex side washed in alcohol and dried in a water-bath. The increase of the weight of the cover shows the amount of quicksilver in the ore. The cover is freed from quicksilver by exposing it to a red heat, and the weight must agree with that first noted. Care must be taken not to inhale any vapors of mercury at this last operation and to perform it under a draft.

The cavity in the cover must be deep enough to receive water enough to cool it during the operation. The cleaning of the cover answers the purpose of removing the bituminous distilling products, if any, and also to hasten the drying of the cover in the water-bath, which takes from two to three minutes; the weighing of the cornet must be performed before it becomes cold. If very rich ore is treated, the quicksilver on the cover is in a somewhat fluid state, and may drop off, if it is not carefully taken from the cup. This may happen also in washing the cover in alcohol. In such a case all the alcohol is poured into the cavity of the cover, whereby the quicksilver globules are again taken up by the gold. Mr. Kustel, in his blow-pipe assay, adopted also fine iron filings in place of lime or soda, thus avoiding the inconvenience of having to dry the soda.

Another Artificial Stone Patent.—At the State Fair we examined with interest and satisfaction, a modest yet highly important exhibit made of the Union Stone Co'a manufactures, by Geo. G. W. Morgan, of Sacramento. The imitations of malachite, and other fancy and fine varieties of stone, were very beautiful, and must be seen to be appreciated. The Sacramento *Union* noticed the display as follows:

One of the most remarkable inventions of the age is to be seen in the lower hall. It is a series of specimens of artificial stone. Here we find soapstone, sandstone, granite, marble, and imitations of ivory. Among the samples is an elastic stone ball, or billiard ball, which you may throw into the air and let it fall a hundred times without breaking. Maj. Gen. Gillmore, the eminent engineer, who had charge of the United States forces before Charleston, South Carolina, was detailed by the Government to investigate into the subject of building stone, and reported as follows, the figure representing the crushing weight per square inch in pounds;

NATURAL MATERIAL.	
Granite, Patapsco	5,340
Granite, Quincy	16,300
Marble, Montgomery county, Pennsylvania	8,950
Sandstone, strong	5,600
Sandstone, Connecticut	3,319
ARTIFICIAL MATERIAL.	
Brick, first quality hard	4,368
Beton, Coignet's	7,500
Concrete, Ransom's	6,720
Frear Stone	4,500
Sorel, Union Stone Company	21,562

The patent right of the State is for sale, and we hope the opportunity to purchase it will not be allowed to pass from Sacramento. By the above report of General Gillmore it will be seen that this invention is greatly superior to all other similar inventions. It is said to be very cheaply manufactured. Surely here is a great chance for somebody.

New Incorporations.

California Dehiccated Fruit Co.—Oct. 17. Objects: The purchase, sale and drying of fruits and vegetables by means of the process known as the "Steven's Desiccating Process," and for the purchase and sale of the patent. Capital stock, $2,000,000. Trustees—Ben. Wellman, Theodore N. Hatch, Jesse Cheney, Pardon W. Browne, James M. Seawell, Geo. Bower and Nathan C. Paddock.

Whitman S. M. Co.—Oct. 18. Location: Indian Spring District, Lyon county, Nevada. Capital stock, $5,000,000 in 100,000 shares. Trustees—J. H. Crocker, J. K. Fields, and G. D. Crocker.

North Star Lenge M. Co.—Oct. 18. Location: Ely District, Nevada. Capital stock, $3,000,000 in 30,000 shares. Trustees—M. Tranor, George T. Knox, S. de Greayer, P. J. White and James Conlin.

Imperishable Pavement Co.—Oct. 18. Object: To manufacture imperishable stone blocks for covering sidewalks and roofs; to make curbs; to mine aspbaltum, and collect mineral oils and sell the same Capital stock, $300,000. Trustees—Peter Donahue, H. H. Haight, Eugene L. Sullivan, B. S. Alexander, William H. Raymond, D. C. McKuer, Charles J. Brenham, W. A. Aldrich, J. T. Dean, J. W. Stow, G. O. McMullin, F. H. Rosenbaum, William Blanding, C. J. Jansen and Rodmond Gihbona.

Lowell Hill Gravel M. Co.—Oct 22. Location: Placer county. Capital, $100,000 in 10,000 shares. Trustees—D. D. Colton, J. D. Fry, Charles E. McLane, A. K. P. Harmon and Charles V. Hohart.

Giant S. M. Co.—Oct 22. Location: Ely District, Lincoln county, Nevada. Capital, $3,000,000 in 30,000 shares. Trustees—S. P. Collins, E. L. Peckham, F. Ogden, J. J. Moynahan and George A. Treadwell.

A certificate of the increase of the capital stock of the Eugenia Gold and Silver Mining Company from $400,000 to $4,000,000, in shares of $100 each, was filed in the County Clerk's office, on the 21st inst.

Meetings and Elections.—At the annual meeting of the Baltic Silver M. Co., Ely District, the following Trustees were elected: P. J. White, S. G. Worden (President,) G. Atchinson, J.C. Bollinger, C. W. Davies, (Secretary).

India G. M. Co.—Oct. 19. Trustees: John Landers, W. Everson, J. L. Blaikie, J. H. H. Williams and David Wilder.

South Chariot M. Co.—Oct. 21. Trustees: Hill Beachy, G. W. Grayson, R. R. Givens, M. J. McDonald and Tyler Curtis.

Narrow-Gauge.—A movement is on foot to connect the city of Stockton, on the San Joaquin, with Visalia, in Tulare Valley, by a narrow-gauge railroad. It is to be called the People's Railroad, and a number of the principal business men of the former place subscribed liberally at a meeting recently held. A road of this description would be of incalculable benefit to the portion of country over which it is intended to run, and would materially assist the farming population on its line.

Planchas De La Plata.

The San Diego *Union* says that several persons have gone to investigate the recently-discovered silver mines on the boundary line of Arizona and Mexico, supposed to be the old mines known as the Planchas de la Plata. The vicinity of the mines has been overrun, and now, although the excitement is but a few weeks old, there are fully 1,500 people on the ground. Most of these are Mexicans.

As the mines are attracting a great deal of attention, we publish from the Tucson *Citizen* the following interesting translation of a statement made in a work entitled "Loa Apostolica Compañio de Jesus." It plainly refers to the "Planchas:"

That in the year 1769, on the frontier of the barbarous Apaches, in the country called Arizona, to the north of the Presidio of Altar, and near the "Agua Caliente," a rich mineral deposit was found, containing virgin silver. The discovery was made by a Yaqui Indian, who revealed it to a merchant who published it; that he found it on the side of the mountain whose ridge was about one-half league in length. By prospecting the ground to the depth of a few yards masses of pure silver were found weighing from one to two arobas each (an aroba is equal to 25 lbs.); that they afterward found many pieces weighing 20 arobas each, and one that weighed 140 arobas. The latter was found by a native of Guadalajara, who broke it up in many pieces that he might weigh it. The discoveries of such wonderful riches brought together a large number of people, who claimed and worked all the adjacent land, where some of them found pieces of silver smaller than those previously mentioned, and some found grains, and some found nothing.

If the re-discoveries turn out to be as rich as reported, a large number of miners from Nevada will flock into the Territory and assist in their development.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Wm. H. Rattenberry—California.
Frank S. Chapin—California and Oregon.
I. N. Hoag—Sacramento, General Agent.
F. M. Shaw—Southern California.
L. P. McCarty—General Agent.
Samuel Cushman—Colorado Territory.
A. C. Knox, City Soliciting and Collecting Agent.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by Dewey & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company—Location

of works, Grass Valley, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of October, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, at No. 23 Merchants' Exchange, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 2d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 25th day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office—23 Merchants' Exchange, San Francisco, Cal.
oct5-5t

Excelsior Silver Mining Company—Location of works, Yellow Pine District, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of September, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin to the Secretary, at No. 340 Washington street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 29th day of October, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, November 22, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. A. KOLLMYER, Secretary.

Office, 340 Washington street, San Francisco, Cal.

Indus Gold and Silver Mining Company—Location of works, Virginia City, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1872, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at No. 24 Merchants' Exchange, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, 24 Merchants' Exchange, California street, San Francisco, Cal. oc26-4t

Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of October, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 220 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 21st day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. H. CORNELL, Secretary.

Office—No. 220 Clay street, San Francisco, Cal. oct9-4t

Lady Franklin Gold and Silver Mining Company—Location of works, Silver Mountain Mining District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the 24th day of September, 1872, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company payable immediately, in United States Gold Coin, to the Secretary of the Company, at 507 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of October, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighteenth day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

J. S. LUTY, Secretary.

Office, No. 507 Montgomery street, San Francisco, Cal. oc5

Louise Mining Company---Location of Works, Ely Mining District, Pioche, Lincoln County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment, No. 3, levied on the 14th day of September, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificats.	No. Shares.	Amount.
Allen, O R, Trustee	336	50	$25 00
Allen, O R, Trustee	357	50	25 00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of September, A. D. 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, room 5 and 5, No. 302 Montgomery street, San Francisco, California, on Saturday, the ninth day of November, A. D. 1872, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.

Office, Room 5 and 6, No. 302 Montgomery street, San Francisco, California. oc26-3w

Nevada Land and Mining Company—Location, Spruce Mountain Mining District, Elko County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, of said Company, held on the first day of October, 1872, an assessment of Eight cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 23d day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery St., San Francisco, California. oc12

Noonday Silver Mining Company---Location of works, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of October, 1872, an assessment (No. 12) of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 25 Hayward's Building, California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 15th day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 4th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. H. FISH, Secretary.

Office—Room No. 25, Hayward's Building, No. 419 California street, San Francisco, California. oct9

Ohio Consolidated Gold Mining Company of West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of September, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 422 Montgomery street, Room No. 1. Any stock upon which said assessment shall remain unpaid on the second day of November, A. D. 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 23d day of November, A. D. 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. AUGUSTUS KNAPP, Secretary.

Office, 422 Montgomery street, over Donahue & Kelly's Bank se28-4t

Silver Sprout Mining Company—Location of works and mines, Kearsarge District, Inyo County, State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 26th day of August, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E. B. Mott, Jr	44	200	$100 00

And in accordance with law, and an order of the Board of Trustees, made on the 26th day of August, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, S. F., on the 8th day of Novsmber, 1872, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office, Room No. 1, Second floor, No. 318 California street, San Francisco. oc12-4t

Silver Wave Mining Company—Location of works, White Pine Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the Twenty-first day of September, 1872, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary of said Company, at the Company's office, 418 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Saturday, the Twenty-sixth (26th) day of October, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the Twenty-fifth (25th) day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

se28-4t J. W. CLARK, Secretary.

Office, 418 California street, San Francisco, Cal.

State of Maine Mill and Mining Company—Location of mine, Amador County, California.

NOTICE is hereby given that at a meeting of the Board of Trustees of said Company, held on the 17th day of October, 1872, an assessment of five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 306 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 26th day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

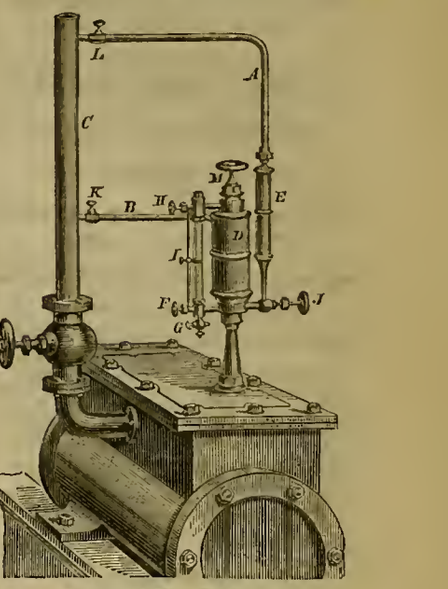
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pips A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; l, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.

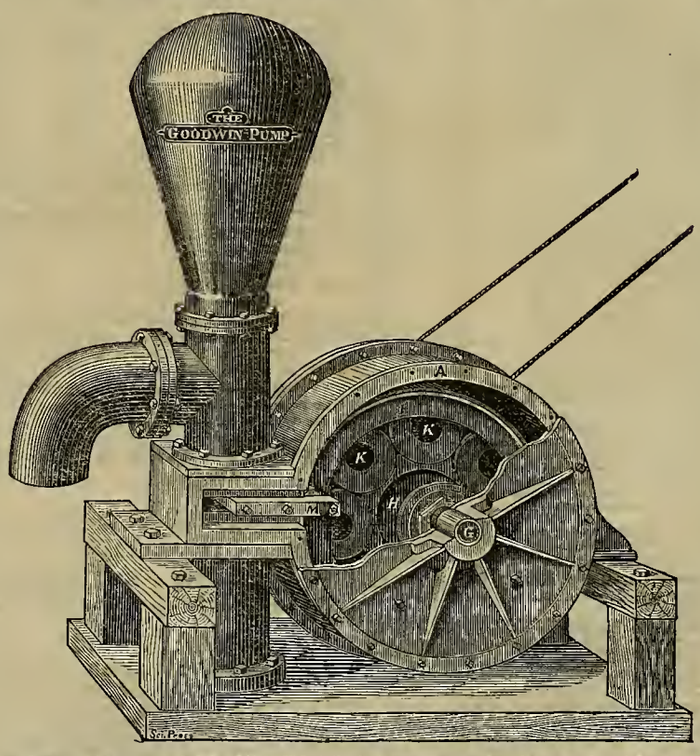
THE GOODWIN PUMP.



This Pump, which was awarded the PREMIUM at the last State Fair, where a large number of Pumps were exhibited, is the CHEAPEST, MOST EFFICIENT and DURABLE PUMP now manufactured.
We are rapidly increasing our Patterns and extending our facilities for manufacturing, but have not yet been able to fully supply the demand. As our Pump has no valves, it is the best Pump for mines where water containing sand or sediment, or where hot liquids have to be pumped.

It is Unsurpassed for Hydraulic Mining,

And will throw a stream of from two to six hundred inches of water with a force equal to a fall of two hundred and fifty feet. It is peculiarly adapted to windmills for irrigating, or domestic purposes, and is equally as efficient and noiseless at a high or low speed, the water raised being in the ratio of its revolutions. Our large irrigating Pumps will throw twenty thousand gallons per minute.

PUMPS FOR EVERY PURPOSE AND ALL CAPACITIES,
MANUFACTURED BY
GOODWIN & WEST,
No. 235 FIRST STREET, - - - - - - - San Francisco (Miner's Foundry).
ALL WORK GUARANTEED.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

Send for Illustrated pamphlet to

BURLEIGH ROCK DRILL CO.,

FITCHBURG, MASS.

25v24-6m

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces,—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

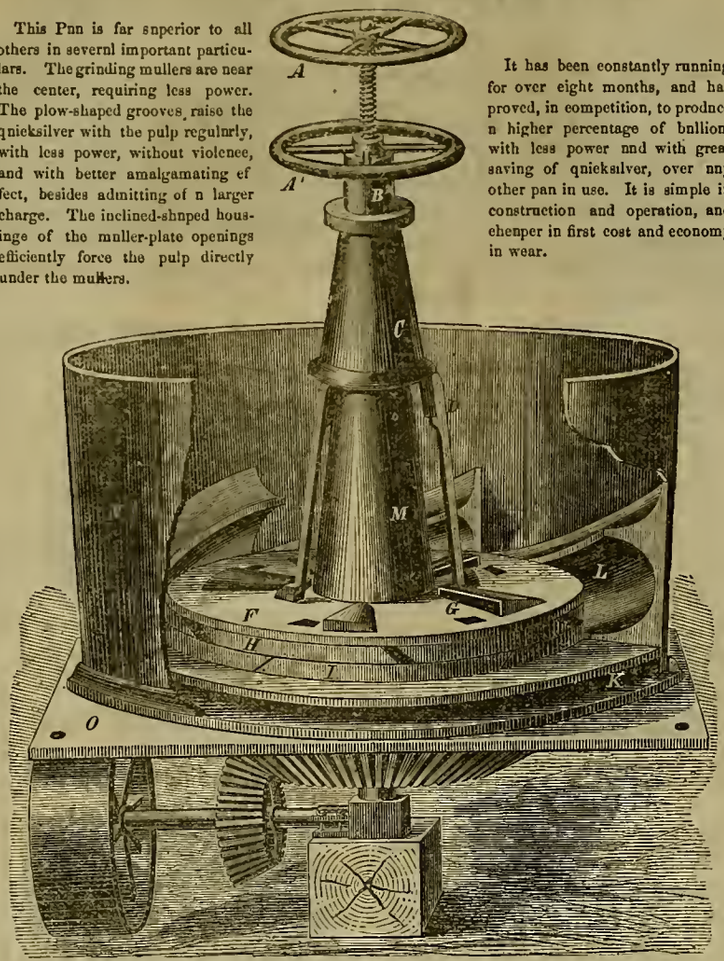
AND GENERAL MACHINISTS,

Howard st., between Fremont and Beale, San Francisco

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

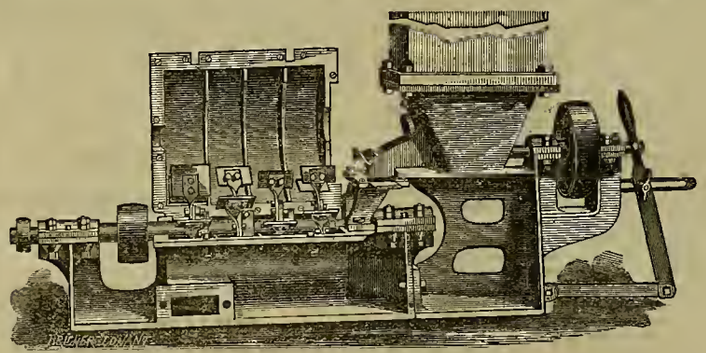


It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operations. Respectfully J. W. JONES, Superintendent, etc.

May be seen in practical operation on Main street, between Howard and Folsom, San Francisco.

This Machinery has been adopted by nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

LIGHT FROM THE WEST.—The spirit of progress has somewhat upset our old notions on the subject of light. We used to look to the East for knowledge in the arts, sciences, religion and everything else. We were accustomed to receive all good things from the Orient and all evil things as well. Plagues and contagious diseases, as well as literature and science, followed the course of the sun, and came to us from Europe and Asia. But lately we are reversing this order of things, for here comes to us from San Francisco the SCIENTIFIC PRESS, one of the very best papers of its kind in the world—fully up in the latest discoveries and inventions, and altogether a most valuable and ably conducted journal. —[Industrial Age, St. Louis.

RENO, Nev., October 19, 1872.—DEWEY & Co., San Francisco—Gentlemen:—I have just returned home. Received Patent Letters and SCIENTIFIC PRESS all right. And now allow me to say that your prompt, honorable and business way of securing Patents will ever be held in due regard by me; and it will be a pleasure to me to recommend you to my fellow citizens. Respectfully and truly yours, J. F. PEACOCK.

The Mining and Scientific Press for 1872 is Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volums XXV.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scisntific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulats the higher virtues and natures and progrssive intellscts of both men and women.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS i not strictly s "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practicslly scientific men from our intslligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Address

20v22-3m16p

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid Also a copy of NEW PATENT LAW of 1870.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 2, 1872.

VOLUME XXV. Number 18.

Mineral Land Decision.

An important decision has recently been rendered by the Commissioner of the General Land Office with regard to the title of mineral lands on those patented to the Central Pacific Railroad Company. People had in many instances already located mining ground on some of these sections, and other parties who had purchased the land from the railroad company found them in possession. This naturally gave rise to disputes as to priority of title, which the Commissioner decides in a manner to show that a possessory mining claim which existed at the time the Government granted the land to the railroad Company, can be patented, and the patent will hold good over any given to the company, or conveyances made by them to private parties. The decision, which we append, will serve to put a stop to further litigation:

"Inasmuch as all known mineral lands, excepting coal and iron, are *expressly* excluded from the railroad grant, and from *all patents issued thereunder;* any party having *bona fide* subsisting mining claim upon a tract of land, at the date of the erroneous patenting thereof to the railroad company, is in no way debarred from proceeding to obtain a Government patent for such mining claim, in accordance with the mining statutes of Congress; it being only under such statutes that valid title to known mineral land can be acquired; but when lands have been patented to the company and a mining application is filed therefor, either the *company or its grantee* may come forward, provided they appear within the time fixed by the mining act for adverse claimants to disprove the mineral character of the land, should they desire to do so."

Grains of Science.

[Written for the PRESS.]

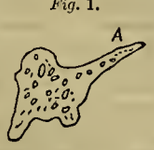
Hands.

Did you ever think Nature always succeeded in making the thing she set out to do in the first trial? In the workshop of the universe there are no failures. But millions of patterns are started and thrown aside unfinished, or left to answer a temporary object, and though crude and transitory, they win a certain achievement. The primary effort is generally as objectless to appearance as the shapeless segment of a rock out of which shall result a "Greek slave." The earliest recognized attempt to make a hand came so far short of it, none could tell what particular object was intended. But when a beautiful hand is at length formed, we can trace back the idea in kindred resemblances and finally end in the neighborhood of its beginning, with a coarse prong. Feet were made before hands. They were needed first. Before the mould of the hand proper was completed, the foot performed many of the offices of the future hand. The hand therefore, is the out-growth of the foot.

Let us bring forward a handful of specimens and see how nature handles her prentice patterns.

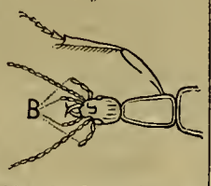
The *Amœba* is able to protrude a hand, which it extemporizes for the occasion of its use. There is a great deal to be said of the *amœba*. It is typical of a wide range of idea. At present we only refer to it for the embryo conception of a hand. The point, A, reaches out, and if it touches a morsel of food the point contracts while the body swallows the nutrient object simply by surrounding it. The finger returns and is fused with the body.

Fig. 1.



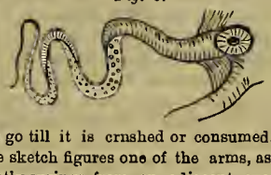
The palpi situated about the mouth of insects are dimly prophetic of hands. These creatures are endowed with one or more pairs of palpi, which like the movement of fingers, serve to direct food to the mouth. The dotted lines from B, in the figure, indicate two pairs of palpi of one of the beetles.

Fig. 2.



The cuttle fish *(sepia)* possesses neither hand nor foot, but its organs of prehention are monster fingers which at once do the work of feet, arms, hands and fingers. They lay hold of an object never

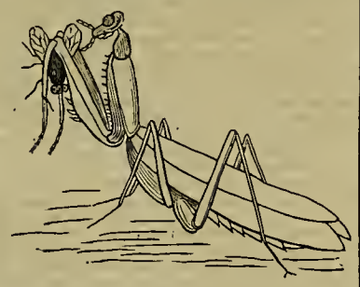
Fig. 3.



to let go till it is crushed or consumed. The above sketch figures one of the arms, as it apparently springs from an adjacent eye. The elephant's trunk affords but a faint idea of a hand terminating with a single finger. It can turn the crank of a hand organ, and pick up a penny, but it cannot thread a needle. This member is to be classed with the palpi of insects, being an appendage to the mouth.

One of the next steps toward working out the problem of the hand is seen in the *Mantis*

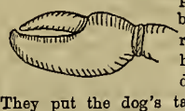
Fig. 4.



religiosa which is enabled to capture its prey with its fore feet. This creature, like squirrel and bear, uses its fore feet so cleverly, we are led to suppose they could use hands much better if they had them.

A solid hand with its opposing thumb is outlined in the lobster's claw. It resembles a hand in the same degree the mitten resembles the glove. This more complex though single member, answers the prehensil purpose of both feet above referred to. A hunter with his dog and a fish peddler with lobsters met. They put the dog's tail under the lobster's thumb. The animals suddenly started off, one after the other, neither heeding the whistle of his owner to return. The lobster swiftly followed the quadruped home. It was nip and tuck. Tuck kept his length ahead; he betrayed emotion. Nip held his own.

Fig. 5.



We cannot strain the vision of our subject far enough to see a hand in the fore legs of the sand-wasp. But its motions when at work in digging are so adroit as to attract attention. With movements almost as rapid as their wings in flight, they will dig and throw a continuous spray of sand under the body and between the legs a distance of some three inches in the rear, similar to a dog when he digs for a squirrel.

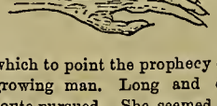
The frog's foot reaches into the pattern of a hand quite perceptibly, lacking one finger to the hand. With one foot it will endeavor to brush a smarting drop of nitric acid from the skin of the opposite limb, even after decapitation,—which shows not all the presiding *will* force occupies the head. Each foot of the more perfected lizards are endowed with the full number of five digits. At this stage of development the imagination is not taxed to perceive the palmated figure well asserted. But the thumb we saw rough-hewed in the lobster, seems not to have kept pace with the rest of the hand. It was then individualized both as function and organ. In the lizard the organ is a kind of supernumerary, but without special function.

Fig. 6.

Fig. 7.

What a fund of meaning there is in the fact, as we find the model of the hand perfected in the monkey. It consummates an era in structural economy. Here nature appears to have made a pause, as if to shake hands over a great victory. She has now an index *finger*, with which to point the prophecy of the future outgrowing man. Long and devious was the route pursued. She seemed so elated with her success, and the achievement proved so handy, she tried to put one on each of the four extremities of all the monkey tribe; and being the best and latest thing of the kind—though hairy and rough—it was handed down the finishing grade of living mechanisms, to be bleached and polished in man.

Fig. 8.



Thus millions on millions of trial steps were made within the realm of creatures of lesser wants, ere the graceful hand of the human period was produced. A. S. HUDSON, M. D.

Oakland, Oct. 1872.

Narrow-Gauge.

We had the pleasure this week of meeting Mr. N. Byers of the *Rocky Mountain News*, the pioneer paper of Colorado. Mr. Byers says that the narrow-gauge railroads in operation there are undoubtedly a success and will be of great benefit to Colorado as they would be to California. In all rocky and mountainous regions the narrow-gauge roads he deems far superior to those of the old style, from the fact that engineering difficulties are much more easily overcome and for economical reasons.

The town of Pioche, Nevada, now the centre of a most productive and busy mining locality is particularly in need of outside railroad connection, and the *Review* suggests that a narraw-gauge road be constructed from there through White Pine and Lincoln counties. That paper says the traffic between the mining towns of those counties, including Hamilton and Pioche would pay a good profit on the cost of such a road. With a narrow-gauge railroad on the route proposed, lumber and wood for buildings and mines and for fuel could be laid down at Pioche at one-half the present rates. The road could be extended through to the Colorado river and to the mining regions of Arizona with great benefit. We believe the narrow-gauge will also prove extremely desirable in many of the valley districts of California.

The Diamond Question.

Notwithstanding all that has been said with regard to the reported finding of diamonds in Arizona and the return of several parties sent out to verify the original reports, there appears to be as much uncertainty with regard to the real facts in the case as there was when the reports of diamond discoveries on our southern border were first promulgated. It is evident that the persons most interested in these discoveries, whether of the original company or of any of the numerous companies since formed, have no new developments to make public. It has been stated from time to time, that additional finds of valuable stones have been forwarded to this city and elsewhere; but the whereabouts of such finds, to which any considerable value can be attached, appears to be unknown except to the writers of sensational articles for the daily press who are expected to find something new every day, for the gratification of their gaping readers, and who appear to care very little as to the reliability of what they write so long as it is read and made the sensation for the day. Without at all intending to express any disbelief in the reported finding of diamonds in New Mexico, we are still constrained to say that so far we have been unable to put our finger upon a single established fact beyond the well-known exhibition of diamonds in this city by the original Roberts-Harpending Co. The intimation, by some English diamond merchants, that those jewels were purchased in England, does not seem to have much weight, in the light that has recently been thrown upon the matter. The circulars with regard thereto, which have been gotten up and widely circulated, betray upon their very face the interest which has prompted their circulation—the fear that the reported discoveries may prove true and thereby seriously affect the diamond market of the world before said merchants can place themselves in a condition to meet such an emergency with safety to their financial interests. The argument is merely negative and inferential in character.

In the light of the long admitted fact that diamonds have heretofore been found not only in New Mexico, but in Wyoming and various places of California as well, it will not do to proclaim the impossibility or even the improbability of the Roberts-Harpending find. The real question would seem to be as to the location, extent and richness thereof. Why should we assume in view of the abundant occurrence here of all other rich treasures that we cannot have diamonds to complete the list? There is no reason why we should discourage exploration when we have thousands of able bodied and willing explorers who are idling away their time upon the streets. We would not hold out inducements of anything like a certainty of reward for prospecting for diamonds in New Mexico; but so long as we are daily accepting reports of new discoveries in Utah and Nevada, we should not totally ignore similar reports from the adjoining territory on the South.

Even if no further developments are made than those now before the public, we have reason to believe there will be quite an exodus thither in the spring, for which, if no other benefit is derived, a large and valuable territory will be opened up to cultivation, where both the miner and the agriculturist will doubtless find a profitable field for labor.

SUBMARINE CABLE.—Hallidie & Co., of this city, have just completed the first submarine cable ever manufactured in this State. It is in two immense coils, and will be shipped to its northern destination in a few days.

Notes on the Reduction of Gold Ores.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

[Concluded.]

In most instances the gold obtsined in these trisls is free gold, which ought to have been extrscted by the ordinary sppliancee alresdy considered, had theee been efficient and suited to the work. Let our crushers try any method of saving the gold they are now losiug, which their experience msy suggest, but no conclusions should be drawn from euch trials until it hse been sscertained by exact asssy what gold is left in the sand after it has been operated on.* Any one entering on the path of experimental research should hold his opinione and theories loosely, prepared to absndon or change them as each addition to his experience msy direct; and unless he is imbued with this spirit, it would be almost better to fall back into the ranks of those who hold that ignorance is bliss.

Taking the queetion as it now stsnds, it has certainly been proved in the most convincing wsy—viz., by prsctical working on a large scale, carried on for seversl years—that the coarser particles of the sulphides in the wsete tsilings, msy be sepsrated, and the gold extracted by a procese which even now showe a profit of over seventy per cent. of the vslue of the gold obtained, and that in desling with eulphides contsining under three snd a half ounces of gold per ton, thus showing that even one ounce of gold per ton would do more than pay the cost of operating. With the richer sulphidee present on most of our gold fields, the profits would be proportionately larger.

These facts are incontrovertible, and they have been open to any one who would have enquired for the last three years; yet, strange to say, they have attracted little attention, and even when pressed upon the notice of mining companies, it is difficult to overcome the indifference which exists in all mattere connected with the improvement of the great interest of the colony.

When the erection of a plant for the extraction of the pyritous gold would be inconvenient, the richer sulpbides might be ehipped to England, where an unlimited market will be found for them. One parcel sent there was sold by its gold contents, at the rate of £3 10s. per ounce, and the agents reported "that as the working of theee ores becomes better understood in England (a result immediately consequent on a steady supply) so a keen competition will arise, and an extreme value be realized."

A very large proportion of the sulphidee are crushed so fine that they cannot be eeparated from the waste sand by the plans hitherto used; and, for several years past, experiments have been carried on, with the view of discovering some dressing machine that would effect this object. A percussion table, so modified as to remedy the defects of that ore dresser, has been designed and worked for some time past hy the writer; the trials hitherto made indicating that it will save a very large proportion of fine pyrites, which has up to this time, eecaped from all other machines tried. The object of these notes, however, is not to press on the notice of the mining community an invention in which the writer is personally interested, and where doubts might be felt as to the accuracy of resulte obtained hy him in working these tablee. But the question of a more intelligent application of the principlee on which the methods adopted for the reduction of gold ores should be based, and of the saving of the pyritous gold, is in a different position. Here we have facts and statistics to rely on, over which the writer has no control, and such ae no reasonable man can doubt. To the enquiry, if on one mine where the sulphides are comparatively poor, and in small quantities, over £2,000 per auum can be realizeu by operating on them, what would be the effect of the general adoption of the system on the mining interest of the colony. Only one reply can be given. It is for those interested to determine how long they can afford to throw away gold needlesely, and neglect the profits that might be derived from this source; but in no other pursuit than gold mining would a matter of such importance to its successful prosecution be passed over, even for an hour. The market for gold is practically an unlimited one, so that the price is uniform; and there can hardly be a stronger illustration of the beneficial action of competition on human progress, and the apathy and want of enterprise attending its absence, than the present state of this question.

Both in the mechanical and metallurgical operations attending the treatment of gold ores, the plan followed should depend on the character of the gold and the minerals aesociated with it in the vein, instead of one system being employed for all, whether it is adapted to the material to be operated on or not. The loss with the beet arrangements must be a large one, considering the great value of the metal obtained, and therefore every aeparate part of the work ehould be carefully watched, and its action and results investigated; for little improvement can be expected unless the degree of efficiency attained, and the extent and character of the difficulties to be overcome, are first known. For this purpose some metallurgical knoweldge is no doubt required; bnt that necessary in the present case is of such a simple character as to he within the reach of every man posseesed of ordinary ability, and there is no excuse for any one accepting the responsibility sttending the conducting of a crushing establishment, without making himeelf acqusinted with the principlee on which the operatione must be based, if they have to be carried on creditably to himself, or with the greatest amount of profit to the company, who have entrusted their business to him.

We are inclined to look hack to the days when the rich surface quartz was broken up by hand, or by eome roughly constructed machine, with mixed feelings of wonder and pity for the ignorance which then prevsiled. In a few yesrs we shall probably regard the waete of the preeent time in a eimilar light, and the eooner we set about providing a remedy for the exieting evils, the hetter will it be for all parties concerned.

APPENDIX.

The following description of a plsn used for testiug the vslue of tbe waste, may be of some uee to those not alresdy acquainted with it:

Sampling from Stamps.—When the object is to ascertsin the vslue of the tailings after leaving the ordinary process for extracting the gold, the plan adopted may be ss follows:—

Take a new bucket (to be kept solely for this purpose), and place it under the epout carrying off the tailings from the mills, until it ie full of ssnd and water, not allowing it to run over. This should then be emptied into a filter—the process being repeated six or eight times in the twenty-four houre.

To form the filter, take an ordinary cssk with one end out, and a hole at the bottom to allow the water to run off. This cask is set on end, and a piece of canvae or strong calico ie thrown over it, and thrust down eo as to form a hag in the cask,— a hoop being elipped on to keep it in its place, and a loose lid fitted to the cask to prevent dust or gold from getting iuto it. The water gradnally filters through the canvas or calico, leaving the solid matter behind. After the process hae been continued for a few daye, the contente may be emptied into a clean tub, well mixed together, and the quantity required for assay taken out.

Sampling from Heaps.—Sections should be opened on different parts of the heap, and a cut taken from the top to the bottom of each, so as to get about an equsl quantity from each section, and the sand so obtained should be well mixed together.

In sampling both from the mill and heap great care should be taken to use enamelled dishes, clean tuhs, etc., to make eure that the gold obtained belongs to the sample, and has not come from any other source. Unlees this is attended to, the result of the assays oannot be depended on.

Amount of Sulphides.—This may be roughly determined by taking, eay fifty-six pounds from the sample when dry, and washing it several times over with great care, to eeparate the sulphides. The latter may then be dried and weighed, and the amount per ton easily calculated.

Amount of Gold.—The aecay for this should be first from the general sample of tailinge, and eecond from the clean sulphides obtained as described ahove. If an exact assay is required, one or two pounds weight of each (taking care that these are fair specimens of the bulk), may be sent to some assayer of standing, who will make a return of the total gold contents that can be depended on.

Or rough assays may be made on the spot, which, although not giving the full amount of gold in the sample, will yet come within fifteen per cent. of it, if carefully carried out in the followiug way:—

Assay by Amalgamation.—The sample to be tested must be dried and weighed. If it is a rich sulphide, one pound weight will give a sufficient trial—if poorer material, from two to five pounds may be used. The first point is to roast the aand, and this may be done over an ordinary fire, in an *iron* frying-pan, or on an iron plate. The sand should be epread thinly on this, brought up to a red heat, and frequently rsked to expose every part of it to the action of the air. The roasting should be continued until no smell of sulphur can be felt on bringing a portion of the sand close to the face; and to finish it a smart heat should then be kept up for half-an-hour. If in the amalgamation the mercury is affected, this will probably arise from imperfect roasting.

When the sand is taken off the fire, it should be left to cool for a short time, and then be rubbed to a fine powder in a wedgewood mortar; an iron one might have gold adhering to it. A convenient quantity (say from half a pound to a pound) of this may then be taken, and sufficient water added to *damp* the sand, and make the particles adhere together. This is placed in the wedgewood mortar, with from two to three ounces of mercury, and the whole ground together for twenty minutes. The mercury will break up into globules, and be distributed throughout the damp sand. Water must then be added, and the pestle worked slowly round, when the mercury will collect again. The sand should then be washed off, and the process repeated (using the same mercury) until the sample has all been operated on. The mercury must then be carefully washed, to free it from every particle of quartz or iron, as theee would otherwise remain with the gold, and render the assay incorrect.

The easiest way of thoroughly cleaning the mercury is to pour it from one saucer into another several times, washing the eaucers each time they are emptied to get rid of the particles adhering to them. The water should then be taken off with a *clean* sponge, or piece of rag, and the mercury covered with nitric acid. The acid will first be colored green, then orange fumes will be given off, and as it becomes ssturated with nitrate of mercury, it will clear again, when the acid should be poured off, and a freeh charge added. Ae soon as the mercury is all dissolved the gold will be seen in the oup or glass vessel used, in the form of a dark-brown powder. The acid should then be poured off, and clean water added several times to wash out any acid that may still he adhering to the gold. The latter may then be dried and weighed. Before ueing mercury for an aseay, a small portion should be dissolved in nitric acid to make eure that it does not contain gold.

If, from any carelessness, the white nitrate of mercury is deposited, it is better to stop, and wash the mercury clean as described above, before going on with the process. The sample of gold obtained should also be examined with a magnifying glses, and if there are any particles of quartz, or other extraneous matter still mixed with it, an allowauce should be made for these in weighing. Fine scales that will weigh to the twentieth part of a grain should be ueed for weighing, and this should be done as soon as the sample ie dried, for the gold is in such a fine stste of divieion, that a portion is almost certsin to be lost in handling it.

With care aud a little experience the assay by amalgamation will be found sufficiently accurate to guide ordinary work, although the return will alwsys be less than the sctual gold contents of the sample; but it should not be entirely relied on, as the presence of some minerale might seriouely affect the result. Occasionally, therefore, correct assays should be obtained, both as a check on the rough aesays, and aleo in cases where great exaotness is required.

* This caution is applicable to other places besides this colony. One of the largest gold mining companies of South America for years took great credit to themselves for the large returns obtained in re-treating a portion of their tailings. When the work came to be closely looked into, it was found that out of 45 ozs. of gold contained in the 50 tons re-treated daily, they obtained about 7½ ozs., a result anything but satisfactory.

Topography of the Great Basin.

In May last Dr. Blake made aome remarks before the California Academy of Sciences, on certain pointe connected with the position and height of the Great Basin in Humboldt County, Nevada, and read a paper at laet meeting on the same subject, which will be interesting to people on this coaet. In his previous paper, Dr. Blake stated that the divide hetween the watera of the Great Basin and the Columbia was situated much further to the south than the position usually assigned to it on our maps, and that its elevation was much lees than is generally stated. Having recently visited this section of country, he was now able to furnish more accurate data as to the position and height of the divide across which the waters of the Great Basin escape. As regards the geographical position, it has been arrived at by oomputation from the observed latitude and longitude of Fort McDermott. The course from Winnemucca was determined by compass, and measured by the roadometer, and the latitude and longitude of the point thus aecertained, was arrived at by computation from that of Fort McDermott, the nearest point at which any accurate astronomicsl observations have been made. The poeition thus formed is 41 deg. 33 min. north lat., 113 deg. 29 min. eaet long. The height of the divide is 590 feet above the valley at the place where the river makes a bend to the southweat to lose itself in the Black Rock Desert, and 390 feet above the level of the Humholdt Valley at Winnemucca, and 460 feet above the head of the Puebla Valley. It is formed of one of the spurs of the Vicksburg range, and the gap in the range extends, at about the same level, for four milcs in a southeasterly direction, the easterly end being rather lower than the weeterly. From the north side of the divide two valleys run, one directly opening into the north end of Puebla Valley, and the other joining the Wyllie Creek Valley, hut opening into the main Puebla Valley a few miles further north. From the north end of Puebla Valley the waters all run north. Opposite the etation at Trout Creek, about 18 miles from the head of the valley, there has been a fall of about fifty feet, and the waters of the creek run smooth from the station for six miles before spreading to form a lake; the first two miles with a fall of thirty feet to the mile, so that the valley at the sink of Trout Creek muet be 100 feet lower than at the head. To the north of the aink of Trout Creek, from the streams running from the south side of Stern's Mountain, these streams form an extensive seriea of lakes, for some milee along the foot of the mountsin; and, although there is no distinct outlet into the waters of the Owyhee, yet the waters from these lakes break out in a series of largs springs, on the east side of a low divide, forming the head of Crooked Creek, whioh after a course of about fifteen miles, joins the Owyhee. There can be no doubt, Dr. Blake thought, but that the waters of the lakes along the foot of the mountain, are comparatively sweet and drinkable; which would not he the case were there no drainage for the water. In fact it is highly probable, that the waters of Trout Creek are drawn subterraneously into the waters of Stern's Valley, as fish live at the foot of the oreek, which they would not do, if the whole of the waters were removed by evaporation.

From these facts it is evident that the divide between the waters of the Great Basin and of the Columbia, is the ridge he had pointed out, and that instead of being 1,800 feet ahove the level of the Humboldt, it is not more than 400 feet, in about the same Meridian, 1,000 feet above the lowest part of the sink of that river, and 600 feet above the level of the Sslt Lake Basin. Whether this ie the lowest divide between the wsters of tha Columbis and the Great Basin, further investigation must determine. The largest beach-marke which are so plainly vieible in many plsces on the eides of mountain ranges, from the Waheatch Mountaine to the Sierras, are, Dr. Blake thinks, formed at about this elevation, so thst it is probsble, at lesst for a long period, the watere of the basin stood at about the height of the divide indicated. He was of the opinion that there are other places in which the present edge of the basin will be found, low on each side of the upper end of the Santa Rosa range of mountains, at the head of the west fork of Queen's River to the westwsrd; and also at the head of Paradies Valley to the esst, low paeses undoubtedly exist. From their appearance the Doctor believed they were higher thsn that in the Vicksburg range. Lesding up to the divide from the south is a broad valley which grsdually rises about 600 feet in a distance of 24 miles. To the north of the divide are two broad vslleye separsted by a low spur of granite with bsealtic axis. The extent of these valleys are such as to preclude the possibility of their having been formed by any drainage from the surrounding hills.

Another indication of the existence of strong current flowing to the north in thie part of the bssin, is furnished by a long promontory of gravel, stretching out from tbe north end of the Bottle Creek range, and which was evidently formed by the meeting of two powerful currents from the eaet snd west side of the range in their course toward the divide. This bsnk of shingle extends about three miles from the point of the mountain in a northerly direction. It has been cut through by Queen'e River, which here makea a bend to the south.

The gravel ridge extende about a quarter of a mile beyond the river, its point apparently having been washed away by the waters from Wheeler Creek. As already etated, the height of the divide above the level of Qneen's River Valley is ahout 600 feet, but Dr. Blake is of the opinion that other outleta must exist, which allowed the waters of the basin to attain a still lower level before their disappearance solely, by evaporation, began. There must, however, have been a large body of water left to disappear by evaporation, as the concretionary deposits which are found at an elevation of 200 feet above the level of the valley. They could only have been deposited as the waters became concentrsted by evaporstion. He was of the opinion that Queen's River Valley, and a large extent of country to the south and west of it, formed part of a secondary basin in which water to the depth of 300 or 400 feet must have disappeared by evaporation.

Over the whole of the area of the secondary baein unmistakable evidences are seen of the gradual evaporation of a large body of water. Not only are the rocks and boulders surrounded with a thick coating of concretionary matter, hut every solid body that was beneath the surface of the water seems to have afforded a nucleus for its deposition. Large numbers of shells are found on the surface of the ground entirely encased in the concretionary subetance to the thickness of two or three inches. Dr. Blake proposes to describe more fully the structure and composition of theee deposits in a future paper.

The eastern edge of this secondary baein is formed by the Santa Rosa mountains; on the north is the high land between the Vicksburg and the Santa Rosa ranges; and the low divide ia between the divide and Puebla Valley, directly south of the Bottle Creek range. The basin is separated from the valley of the Humboldt by a low range of hills about fifteen miles north of the latter river. As to its extent further to the westward the Doctor has no data. It certainly includes the Black Rock Desert, snd in hia opinion a considerable extent of country to the south and west.

Professor Davidson did not entirely agree with Prof. Blake's theory ae to the promontory of gravel indicating the existence of a strong current flowing to the north. He did not think that would cause so large a ridge as the Doctor described. Some little discuesion ensued on this point, which was not definitely eettled, and the Academy adjourned.

The College Courant.—This excellent publication has recently been placed under new editorial management, and numbere among its contributors some of the most distinguished college profeseors in the country, such as President Chadbourne, of Williams College; Ex-President Woolsey, of Yale; President Barnard, of Columhia; President White, of Cornell University; Professor Winchell, of Michigan University; Professor Tyler, of the same; President Porter, of Yale; Profeesor Hitchoock, of Dartmouth, Professor Bascom, of Williame; Professor J. D. Dana, of Yale; Professor Dolbear, of Bethany; Professor Sewall, of Bowdoin; Professor Lacroix, of Ohio Wesleyan University, and Professor Marcy, of North western University. The book-notices in this Journal are always good, and the editoriala are on a variety of topics interesting to educated persons. It addresses itself, therefore, to all people of culture, especially to the nation's educated journalists, teachers and the college community. The subscription price of the *Courant*, which is published in New Haven, Conn., is $4 per year, or it will be sent for three months on trial for $1.

MECHANICAL PROGRESS.

Fragrant Bisulphide of Carbon.

It will be a matter of interest to some of our readers, says the *British Journal of Photography*, to knowu that the nsually offensive liquid, bisalphids of carbon, can be obtained frse from unplsasant smsll, and this as an article of commerce. The vslae of the liquid ae a solvsnt for resin and other purposes is very well known, bnt its extrsmely unpleasant odor had hitherto greatly limited its use, notwithstanding ths fsct that it is very much cheaper than sther, aad can he employed for many of ths purposes to which ether is at pressut solely applied.

We do not know by what process the commercially purified bisulphide is prsparod; but, on a small scale, the following plan succseds very well:—Shake up ahont one per ceat. by weight of corrosive sublimate with the liquid bisulphide, and allow the two bodies to stand for eeveral days with repeated agitation. Some sulphur compouuds appear to be removed in great part or decompoeed by this treatment, for the mercnry salt is rendered nearly black, owing to the formatioa of sulphide ot mercury. This treatment so far reduces the unpleasant smell that, in distillation, a comparativsly sweet-smelliag liquid is obtained; but a much better product is prepared if the bisulphide, after the treatmeut with the corroeive sablimate, be mixed with one-third of its volume of almond oil, and then distilled after the mixture has rested for some time. Of course the bisulphide only distils over, since the oil is not volatile, but the former is now found to possess a rather agreeable ethereal odor. It is probable that the oil acts in somowhat the same way that fat or oil does in retaiuing the perfumes of flowers. In the south of France this power is taken advantage of for the extraction of the delicate odoriferous principlés of flowsrs; but we employ the oil, in the case of the bisulphide, to remove a very nnpleasant smell. The treatment is in both cases effective, whatever its *rationale* may be, and we can convert bisulphide of carbon into a liquid of agreeable ethereal odor. Now that the purification has been effected on a large scale, we hope to see the bisulphide employed for msny photographic purposes for which its nse has been hitherto greatly limited.

It ie possible that this new fact with regard to bieulphide of carbon may have an important bsaring on the possible nse of that snbstance, as an assisting agent in more fnlly economizing the nse of steam by a supplementary engine. Any leakage (and it must be quite impossible to entirely avoid such a contingency) would render its use extremely objectionable, on account of the almost ineufferable etsnch arisiug from ite presence, in even a minute qnantity, in the atmosphere.

Mechanical Skill in China.

A most remarkable evidence of the mechanical science and skill of the Chinese so fsr back as 1600 years ago is to be found in their snspended bridges, the invention of which is assigned to the Han dynasty. According to the concurrent testimony of all their historical and geographical writers, Sangleang, the commander of the army nnder Baon-tsoo, the first of the Hans, nndertook and completed the formation of the roads through the monntainous province of Shense, to the west of the capital. Hitherto its lofty hills and deep valleys had rendered the communication difficult and circnitons. With a body of one hundred thousand laborers he cnt passages over the mountains, throwing the removed soil into the valleys, and where this was not sufficient to raise the road to the required hight he constructed bridges which rested on pillars or abutments. In another place he conceived and accomplished the daring project of snspending a bridge from one mountain to another across a deep chaem.

These bridges, which were called by the Chinese writers, very appropriately, flying bridges, and represented to be numerous at the present day, are sometimes so high that they cannot be trsversed without alarm. One still existing in Shense stretches fonr hnudred feet from mountain to mountain, over a chasm of five hundred feet. Most of these flying bridges are so wide that four horsemen can ride on them abreast, and balustrades are placed on each side to protect travelers. It is by no means improbable (as M. Panthier snggests), as the missionaries to China made known the fact more than a century ago, that the Chinese had suspended bridges, that the ideas may have beeu taken from thence for similar construction by European engineers.

To Rennea Glue Wateapaoof.—The liability of glued articles to come to pieces when exposed to the action of water, eepecially hot water, is familiar to every one. By adding to the water with which the glne is mixed when required for use a small quantity of bichromate of potash, aud afterwards exposing the part to which it is applied to light, the glue is rendered insoluble, and articles faetened with it reeist the action of watsr. The proportiou of bichromate of potash to be taken must be determined by experiment, bnt for most purposes one-fiftieth of the amount of glne employed will be sufficient.

Tempering Steel.

All sorts of mixtures and msthods of tempering steel havs been invsnted, and the eales of patent rights therefor have, in many cases, brought in fortunes to the patentees. Ons of the most promieing, profitable, and apparently excellent of thess patented proceeses, according to the *Scientific American*, is that of German & Siegfried, owned by ths Steel Rsfining and tempering Company, Boston, Mass. Congress has appropriated teu thonsand dollars to pay for the right of its uee in the Governmeut shops. It is said to impart an extraordinry harduese and durahility to the poorest qaalities of steel.

The following dcscription of ths process is from Siegfried's specification, patent of July 16, 1872:

"I first heat the steel to a cherry red in a clean smith's fire, aud then cover the steel with chloride of sodium (common salt), purifying the fire also hy throwiag in salt. I work the steel in this condition aud while subjscted to thie treatment, uutil it is brougbt iuto nearly its finished form. I then substitute for the salt a compound composed of the following ingredients and in about the following proportious: One part, by weight, of each of the following substances: Chloride of eodium, sulphate of copper, sal ammoniac, aud sal soda, together with one-half part, by weight, of pure uitrate of potassa, the ingredients being pulverized and mixed. I alternately heat the steel and treat it by covering it with thie mixture and hammering until it is thoroughly refined aud brought into its finished form. I then retnrn it to the fire and heat it slowly to a cherry red, and then plunge it into a hath composed of the following ingredieuts in substantially the following proportions for the required quantity; of rain water, one gallon; of alum, one ounce and a half; of sal soda, one onnce and a half; of sulphate of copper, one ounce and a half; of nitrate of potassa, one ounce; and of chloride of sodium, eix ounces. These quantities and proportions are stated as being what I regard as practically the best, and it is manifest that they may be slightly changed without departing from the principle of my invention."

What he claims in his patent is the successive processes or steps of the process, with the use of the materials or their equivaleuts, substantially as set forth above.

Wooden Ships.

After a long psriod of depression, the shipping interests is seeing more prosperous times, and the despised sailing vessel is likely to again become a good piece of property. The lack of additions to sailing vessels during the few years past, has at last brought abont a demand quite inadeqnate to the present supply, even for ordinary trade. The nnexpected demand for snch conveyance caused by the present enormons wheat crop of this State has greatly intensified this demand, and freights have gone up to an nnprecedented figure. Ships have been chartered to load with wheat from this port to Liverpool the past season at ratee which wonld almost pay the value of the ship on a single trip.

It is also observed that wooden ships appear to be, if anything, more in favor than those of iron, the reason for which, however, is not so apparent as the fact. There is evidently a large margin yet left in the world's commerce dependent upon wind and eails, a margin which will probably grow still wider unless there is a depreciation in coal or some other material is found as a substitute therefor. It is not improbable that the ship building interest may yet become as active in this country as it was before the war; if so, our own coast wonld profit by the reaction, by the establishment of ehip ysrds in the vicinity of our northern timber regions.

Relative Value of American and English Iaon.—It is impossible to have any absolute standard of comparison between these two kinds of iron, and so be able to say, definitely, one is bstter than the other. For some special purposes, or for some particular process of manufacture, or form of product, one is superior to the other, while for other pnrposes the reverse is true. In general terms, American iron is softer than English and therefore possesses greater ductility and tensility. While it will yield more readily to immediate force, it will stand a greater ultimate strain. Nor does it crystallize under vibration so easily, a property which makes it better fitted for car wheels, axlss and like manufactures. English iron being harder, will endure a greater sudden test of its tension, while it will yield more readily to a long continued strain. It also, as etated above, sooner assumes the orystallized form under vibration. Being harder its power to resist compression is probably greater than American iron. We have been informed that a large New York iron merchant, who has been forced by the recent state of affairs in the English market, to use American iron, has declared that the common brands of Pittsburgh iron are equal, if not superior, to English refined iron.—*Am. Manufacturer.*

Anti-dust Railroad Cabs.—A fsw weeks since, says the Philadelphia *Record*, an anti-dnst experiment was mads on ths fast 2 o'clock express cars to Atlantic City. Thers was teu well-filled cars in the traia, snch having a canvass apron on both sides, covered the epace between it and the rails. The end of thsse aprone lapped, thus forming a continual canvass from one snd of the train to ths other On a part of the trip ths spssd attained was aboat forty miles per hour. There wae not the least particle of duet iu ths first saven cars, but there appeared to be something like duet in the sighth, ninth and tenth cars, but not enough to show on ths garments of the passengers.

It appears to be general opinion on the Contiuent that the only possibls field piecss are bresch loaders. Besides being more rapidly manœuvered, they rsquire fewsr men, and greatsr accuracy iu aim is obtained; and they possess maay other good qualities. It is still, however, a mooted question of what material they shall be composed, some bsing stroagly in favor of bronze, while othsrs as strenuously advocate steel.

SCIENTIFIC PROGRESS.

Dust Explosions in Flour Mills.

Sometime in July last a singular and terrific explosion occured in the Tradeston Flour Mills, near Glasgow, Scotlond, whereby the mill wae utterly demolished and the ruins set on fire. The peculiarities and philosophy of this explosion are referred to in the *Engineer* substantially as follows:

The fire was caused by an explosion which originated in the exhanst, and traveling through the varions conduits of the mill, like fire damp in a mine, set fire to the woodwork. The occurrence cansed some sensation at the time, not because explosions of the kind were previously altogether unknown, but becanse in this instance the attention of the comparatively uninformed public wae attracte dby the nnusual gravity of the accident. A searching investigation iato the circnmstances which probably led to the explosiou, was made by Professor Rankine and Dr. Macadam. After having examined witnesses and documents relating to the history of fires and explosions of a like nature, they reported that the primary canse of the explosion was the accidental stoppage of the feed of one of the pair of stones, which led to their becoming heated and striking fire. The fire thns generated inflamed the tinely divided duet which was diffused through the air in the exhaust conduits and then passed on to the exhaust box.

This sudden iguition or flashing of the extremely inflammable dust diffused throngh the air would produce a very high temperature in the gaseous products of the combustion, and this wonld necessarily be accompanied by a great and sudden increase in pressure and bulk, coustituting in fact an explosion. The firet effect of the explosion was to burst the exhanst box and allow the diffusion of dust and flame throughout the mill. A second explosion followed, and the mill was reduced to rnins. No explosive or other foreign material was nsed in the manufacture of the flour, and the steam-boilers were found uninjured. No blame has beeu traced to the proprietors of the mill, or to sny one in their employment.

Direct experiments were instituted by Professor Rankine and Dr. Macadam with the view to ascertaining the inflammability and explosiveness of this mixture of air and dust. They have also calculated that when the theoretical proportions best-suited to produce an explosion are exactly realized, the pressure of the resulting gaseons products, if confined in a limited space, suddenly becomes equal to about eight times that of the atmosphere. It is probable that, in this instance, these theoretical conditione may not have been exactly reached, but still it is certain that a very great destructive pressure was prodnced.

Now, the question naturally arises, what precaution should be taken to guard against such accidents in the future, or at all events to mitigate against their destructive effects. The problem does not seem a very difficult one. The danger does not lie in the grinding process proper, but in the plans for storing up the dangerous flour-dust. So long as the grinding operations are carried on in the simple manner pursned in small mills, where the stones are simply boarded in, and where there is no exhaust, there can only be a limited amount of dust to inflame. But it is otherwise when the exhaust is employed and the fine dust is drawn up into an exhanst-box. There the flame drawn up from the stonee must inevitably lead to a more serious explosion, and where many pairs of stones are connected with the same exhanst the danger is enormonsly increased. It is accordingly recommended that all receptacles in which the dust is collected shall be lightly constructed and placed outside the buildings, in order that any explosion which might occur in them shonld free itself at once and not be induced to travel back into the mill.

The word "receptacle" is understood to include exhanst-boxes, stive-rooms, smut-rooms and exhanst-fans. The report also contaius a suggestion that the well-known principle of extinguishing a flame by causing it to pass a large cooling surface might be adopted, and in fact the dust shonld be made to pass throngh a number of metal tubes instead of throngh the exhanst-trunk. It is, however, pointed out that cold surfaces are also apt to canss a condeasation npon them of moisture in the air, aad consequeatly the tube system would perhaps be open to the disadvsatage of being liable to become clogged hy pasty depositions.

Naked lights should not be used iu a dusty atmosphere, aud all gas-jets should be protected with gauze. Finally, as the emission of highly-heated particles from the stones is rendered more probable by the entry of nails and piecee of iron with the grain, it is etrongly advieed that the uee of magnets to collect these metallic intruders should be mads uuiversal.

It appears that thsss accidents are of very frequent occarrence in England, and their number has increased since ths introductioa of the exhauet. The fact, however, appears to be little known to the general public.

How Trees are Killed by Lightning.

All who havs examined a tree which has been destroyed by a "thunderbolt" will have noticed not only how ths layers of ths wood have been shattered and separated into s rips, ae if full of wiud ehskes, bnt also the dryness, hardness, and bitterness of the wood, as though it had been throngh the procese of curing in a kiln. This is attributed to the iustantaneoue reduction of the sap—the moisture within the wood—into steam. Wheu this moisture is abnndant, as in May or early June, the amount and force of the steam not only bursts aud separates the layers and tibers, hut rends the trunk in pieces or throws of a portiou of it, down a a line of greatest power or of least resistance. And when the amount of steam thus suddenly generated is less, owing to the drier condition of the steam from continual evaporatiou aud leaf exhalation, there may be no external trace of the lightning stroke; yet the leavee will wither in a few days, showing that the stem has been rendered incapable of conveying supplies, and the tree will either partially or entirely die. Still lighter discharges may be conducted down the moist stem, without any lesion or hurt.—*Building News.*

Lightenino in the Spectaoscope.—The frequent occurence of thunder storms in most localities reuders the observatiou of lightening by the spectroscope a matter of comparative facility; although the extreme transitory natnre of its spectra renders it difficnlt to fix ite lines with that absolute correctness which is attainable with more fixed spectra.

Mr. Procter, an observer of Penrith, records in *Nature* some observations made by him during a thunder storm iu Patterdale. Among other lines in the lightning spectrnm he saw one repeatedly near D^1, and about the centre of the bright yellow band betweeu the two masses of atmospheric absorption lines iu that neighborhood. He also saw the line near *b*; besides which he repeatedly saw a continuous spectrum with bright bands, which might have been the low temperature nitrogen spectrum, although of this he was uncertain. He conceives that there is no donbt that lightning gives two different spectra, one of bright lines and the other continnous. It is, however, possible that the latter is identical with the former, the lines being much expanded; but, so far as he has been able to perceive, he does not think this is the case. A snbsequent observation canses him to donbt if the band spectrum above referred to be the ordinary nitrogen band spectrum.

Cause of Change of Color in Fishes.—A short paper was recently read at Brighton, Eng., by M. Georges Pouchet, on the mechanism of the chauges of color in fishes aud crustacea. The author referred to the fact that fishes often change in color according to the color of the objects by wh ch they are surronnded; but he explained that this does not take place when the fish is deprived of the nerves that preside over the peculiar corpuscles to which the color is due. The change does not take place in blind turbots; and in the seeing turbot, if the nerves are divided which communicate between the eye and the skin, the chauge does not occur. If the fifth nerve is divided the change takes place all over the body except the part to which that nerve is distributed. These experiments, M. Pouchet said, show that the change of color is dependent upon impressions received by the nervous system through the organs of vision.

A Beautiful Experiment.—When fifteen to twenty grammes of granulated silver is introduced into a perfectly dry tube of hard white glass, with from thirty to forty grammes of bisulphide of carbon, and then hermetically sealed, on warming gently and then shaking in the dark, sparks are observed in the liquid, which by continned shaking may be rendered quite luminous. Pouring water on the tnbe causes the luminosity to disappear, but on shaking it becomes visible. This is a beautiful experiment. Iron and aluminum produce similar effects, while platinum, copper, and zinc do not.

An Electric Telegraph in 1818.—*The Journal of Applied Science* states that Sir Francis Ronalds, now ninety years of age, is a member of the Society of Telegraph Engineers, recently established. In 1818, he proposed a system of electric telegraphy, and went to considerable expense in erecting lines of telegraph in his garden at Hammersmith. In 1823, he publieh-ed a book, now very scarce, in which he said the day would come when the king, at Brighton, might commnnicate with his ministers in London as quickly as if he were himself in the metropolis

NOTE.—†—California. *—Washoe. ‡—White Pine. §—Ely District. ¶—Eureka District. ‖—Idaho. ⁋—Nearly. ?—Over.

S. F. Stock and Exchange Board.

THURSDAY, October 31st, 1872.

The Stock Market has been generally better thie week than last, and eales have been increaeed at firmer pricee. Money ie reported easier, and prospects of tbe minee inducs mors people to huy. Dividende for the month of Octoher amounted to $222,000 from the two companiss; the Raymond & Ely paid ite usual $210,000, and the Cederburg, a California mine, paid a dividsnd of 50 cente, amounting to $12,000. Tbie ie a very small showing, taking into conederation the large number of aeseements levisd in Octoher, and tbe numhsr of incorporated companies there are in existencs. Laet year there were dividends from eix mining companies in ths month of October, amounting to $309,400. For the same month, in 1870, the amount was $582,458, against $380,682 in 1869, $450,000 in 1868, and $472,000 in 1867. Judging from the favorable reporte from all quartere we may expect more dividende next month, and ths Crown Point, Bslcher and North Star, ought at least to resums their dividends.

Tbe following unusully largs numbsr of aessments on mining companies wers lsvied during tbe month of Octoher: Alpine M. Co., Amador Co. Cal., $1.50; Altona, Grass Valley, 10 cents; Bellevue, Placer Co. Cal., 75 cents; Deseret Cons. Utab, 20 cente; Eliza, Siskiyou Co., Cal., $1; Emerald Hill, Utah, 50 cents; Empire Mill, Washoe, $1; Granite Tunnel, El Dorado, Co., Cal., 6 cents; Greenville, Plumas Co., Cal., 50 cents; Hale & Norcross, Washoe, $5; Howard Hill, Nevada Co., Cal,. $1; Independent, Butte Co., 40 cents; Indus, Washoe, 50 cente; Justice, Washoe, $2; Kentucky, Ely District, 50 cents; Kincaid Flat, Tuolumns Co., Cal., $3; Nsvada Land and M. Co., Elko Co., Nev., 8 cents; Noonday, Wbite Pine, 20 cents; Original Hidden Treasure, White Pine, $1.50; Ophir, Waehoe, $5; Ovsrman, Wasboe, $5; Pauper, Idaho, 50 csnte; Peavine, Ely District, 25 cente; Peter Walter, Placer Co., Cal., 50 cente; Pictou, Waehoe, 12½ cents, Shipley, Placer Co., Cal., $1; State of Maine, Amador Co. Cal., 5 cents; Tecumseh, Calaverae Co., Cal., 25 cente; Gen. Lee, White Pins, 10 cents; Senator, Washos, 50 cents; Rieing Star, Idaho, $1; Buckeye, Washoe, $2; Ida Ellmors, Idaho, $2.50; Lsmon, Eureka Dietrict, $1; Amazon, Ely District, 10c. There were 36 mining asesssmsnts levied tbis month, and the sams numbsr in September.

Ou Friday the market was eteady and increaeed in strength from prsvione day'e transactions, pricee being very firm. On Saturday prices were gsnerally higher. At cloee Crown Point was $3 higher; Belcber, $1; Chollar, $2; Con. Virginia, $1; Kentuck, $10; Yellow Jacket, $1; Imperial and Empire, 50 cents; Raymond & Ely, $2.

On Monday ths market was estill stronger and orders to huy were plenty; at afternoon Board Belcher rose $8; Crown Point, $2; Con. Virginia, $3; Caledonia, $1; Imperial, 50 cents; Ovsrman, $5; Raymond & Ely, $10; Ophir, $1; Savage was $2 lower.

Tueeday, prices wers still firm, and at the afternoon Board thsre was a large business dons. Belcher rose $5; Caledonia, $5; Con. Virginia, $8; Overman, $9; Raymond & Ely $4; Jacket, $5; Savage was $2 lower; Ophir, $2; Crown Point, $2.

Wednesday, the market was strong and active, and pricss closed still higher. Belcher rose $6; Chollar, $3; Con. Virginia, $1; Crown Point, $1; Calsdonia, $3; Imperial, $1; Yellow Jacket, $10; Kentuck, $10; Ophir, $4; Hale & Norcroes, $3; Overman, $4; Savage, $3. The Ely mines were lower; Raymond & Ely, $3; Meadow Valley, 50 csnts; Pioche, 50 cents.

To-day, pricee were irregular, eome deecription advancing, and some declining. Yellow Jackst rose to $128, the higbest for eome time.

Below will be found news from ths prominent minss wbich is not in our "Mining Summary":

BELCHER. — A letter of ths 29th eays the stopes look wsll. The south drift of tbs 1200-ft. lsvsl is still in splendid ore. Car eamples, $94. Ths new shaft ie in running order.

CROWN POINT.—Letter of the 26tb eays the south crosecut, sonth winze, and the crosscut from the eaet winze, 1300-ft. levsl, are all in ors of a very superior quality, assaying, averags, $165. The ore-hreaete are looking well.

CEDERBURG.—Ths proceeds of 12 days' run with 10 etampe wae $9,164.

CHIEF OF THE HILL.—From this mine $6,492 bullion was received on the 29tb.

RAYMOND & ELY.—A letter from the supsrintendent reade as follows: The mins is producing finsly. Gaining on ths mills with first-class ores, and accumulating a large amount of eecond and third-class daily. "Arrived here yesterday aftsrnoon. I find matters in much hetter state than I expectsd, particularly in regard to ths Kentucky folke. They have hesn foiled in every attempt to get into our workings, and I have not ths elightest appreheneion they will succeed in any attsmpt thsy may make. Knowing as they do the utter hopelessnees of ever securing the slightest property or damagee hy law, their object is to force us to pay them blackmail, and by annoying ne to play upon the timidity of a portion of our stockholders. Lst me again assure you that there is not the moet remote chance of loeing any property hy them. Thers is not the slighteet cause for alarm."

On the 24th $35,341 was shipped; on ths 27th, $36,511 and on the 30th, $35,589; sbipments prsviouse to laet in October amountsd to $273,124, making a total of $308,713, equel to $11,025,44 per day, for 28 daye.

SAVAGE.—During week ending Octoher 26th, 968 tons of ore of an average aesay value of $29.09 was extractsd; 888 tons were delivered at the mille, and 480 tone were on the dumps, Tbe majority of this ore came from the North mine eecond etation.

EUREKA.—A letter of the 26tb, eays the eix daye' clean up, with a run of 15 etamps, amounted to 900 ounces of amalgam.

WOODVILLE.—Bullion received $2,902.46, the proceeds of 100 tons of low grade ore.

PHŒNIX—Twenty tone of hullion were shipped on the 25th, valued at $8,611.

HUHN & HUNT.—Assays on tbe 28th from ths new strike were $581.

PEARL FISHING IN AUSTRALIA.—The helief that the southwest coast of the Auetralian continent, from Nicholl Bay to the head of Yorke'e Peninsula, abound in pearl banke, hae led to the initiation of a pearl-fiehing expsdition, to start from Melbourns. The expcnese of a twelve months' expedition are set down at 1000l., and with 60 days' clear fishing it ie calculated on realizing 6,400l., leaving a net profit of 5,400l. Tbe calenlation on which the schems ie based places the valne of mother-of-pearl in the English markst at from 85l to 225l per ton. Thie ie indepsndent of tbe pearle, which represent a conaiderahle item.—*Melbourne Age.*

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

ARRIVED.—Alpine *Chronicle*, Oct. 19: The hoisting works for the IXL have arrived and ae eoou as the grading ie finiebed the erection of ths hnilding will commence.

CALAVERAS COUNTY.

CLEAN UP.—Calaveras *Chronicle*, Oct. 26: One day this week, $1,200 wae taken from Renz's hydraulic, Railroad Flat, the reeult of a single washing.

ITEMS—MOSQUITO DIST.—S. Smith & Co. are sinking a new shaft, in whicb ore worth $30 per ton has heen etruck. On the firet east extension the vein ie 3 ft. wide showing eome gold.

Grasshopper continues to yield rich ore.

Dowling & Co. are working a large sized veiu, which producee handeome results.

F. Barney crushed 30 tone of ore, producing $26 per ton.

RAILROAD FLAT DIST.—A contract is to he let to eink tbe main shaft of the Wolverine from 200 to 300 ft. deeper. Stoping will soon be commenced. The eize of the Sandereon vein and quality of ore improving. Reynolds & Co. are reopening an old gravel mine which formerly yielded large returne.

WEST POINT DIST.—The tunnel of the Josephine is puehing ahead witb the view of testing the mine thoroughly. Another chimney of pay ore hae been struck in the Blazing Star. The owners of the Lone Star are putting the mine in fine condition. An extensive body of fine milling ors ie iu eight but the tunnel is still being extended.

KERN COUNTY.

BIG BLUE MINE.—Havilah *Miner*, Oct 19: The tunnel on whicb workmen have heen engaged for 2 yeare, hae etruck the rich spot in the 70 ft. ledge, and an incalculahle quantity of ore, valued at $80 per ton, is diecovered.

STRUCK IT.—The proprietore of the Papooee, in running a tunnel along tbe edge of the higheet peak of the Piute Mts., have struck a ledge 10 ft. below the surface, 5

Oriental Co.—The Co. employs 20 men and cleans up about $8,000 every 4 weeks.

Items.—The Empire Co. is working in good rock. A regular pay chute has been found. The Idaho is changing from 15 to 35 stamps, and in a week or 10 days the change will be completed. At Deadman's Flat much mining work is being done. The Independence tunnel is being run with energy. In the Coe there are indications of a splendid ledge.

PLACER COUNTY.

Auburn Mine.—Auburn *Herald*, Oct. 26: The drift at the 175 ft. level is in 80 ft. They have run 30 ft. in the pay chute, and it is richer than when first struck. The ledge is over 4 ft. thick and gorged with gold.

SAN DIEGO COUNTY.

Stonewall.—San Diego *Union*, Oct. 17: We are reliably informed that Frary and Farley have bonded the Stonewall to an Eastern Co., for 90 days, at $200,000 gold coin.

Items.—G. V. King, of the Golden Chariot, reports a clean up of 50 tons from his lead which yielded $8,100, or $162 per ton. Preparations have been made to sink 75 ft. deeper on the shaft from which the ore is taken.

The Owens ledge is turning out pretty rich rock.

The Ready Relief had a crushing a short time since which yielded over $100 per ton.

The Reynold's mill is at work on ore from the Helvetia.

The owners of the Kentuck are erecting a whim at their shaft to hoist rock and facilitate the work of sinking. The shaft is down 80 ft.

TUOLUMNE COUNTY.

Santa Maria Mine.—Sonoma *Democrat*, Oct. 26: The mill will be completed about the first of Dec. In running for the pay streak a 15-inch vein of rich ore has been developed 125 ft. from where ore was taken out at the time of sale. Last week 40 tons yielded $6,500 or more than $150 per ton.

Nevada.

ELKO COUNTY.

Lone Mt. Dist.—Elko *Independent*, Oct. 19: The Whitlatch is from 3 to 4 ft. wide, with a shaft sunk 40 ft. at the point of discovery. The Whitlach Union shows a vein of argentiferous galena from 3 to 7 ft. wide. A shaft sunk 45 ft. demonstrates that the ledge is well defined, and the ore of high grade.

EUREKA DISTRICT.

Hoosac.—Eureka *Sentinel*, Oct. 22: There are 3 shafts down 25 ft. and, from within 6 ft. of the top to the bottom, it shows good ore. Several tons of it lately worked returned $180 per ton. From the bottom a drift is being run west, and is in a solid body of ore; 50 ft. northerly from the shaft above mentioned, another has been sunk 60 ft. and from the bottom of this a drift is being run southerly to connect with the 20-ft. shaft when the latter is sunk deep enough. This drift is in 42 ft. In the drift from 8 or 10 ft. onward the top, bottom and sides are one solid mass of ore. Since last Spring there has been about 200 tons of ore taken out.

Since the Phenix last started up, about 65 tons have been worked, the first-class working $180 per ton, and the second-class $60.

Mazeppa No. 2.—Nearly 7 tons of first-class ore is sacked and ready to be taken to the Mill. The first-class ore will probably average $200 and the second-class $60.

Lemon Mine—The tunnel is in 396 ft. and work is being prosecuted diligently. The shaft is down 150 ft. and shows a fine body of ore. The tunnel is intended to strike the ledge at 210 ft. and will connect with the shaft when the latter reaches the depth. The tunnel is within 50 ft. of the line of the shaft, and several good deposits of mineral have been struck. Ore taken from the tunnel assays as high as $193 per ton, and quite a large amount is in sight.

Adams and Farren.—The shaft is 425 ft. deep. A level is being run at 400 ft. down for the ledge, and the indications are favorable.

New York Canon.—The Morris claim is improving daily. From 40 to 50 tons of good ore is on dump, and more is being taken out every day. In the shaft quite a large body of ore is in sight. The Whipoorwill is also looking well. Twenty tons of ore are out and a large quantity is to be seen in the shaft. At the Excelsior a great deal of good work has been done lately, bringing to light a fine body of rich ore.

Silver King is developed to an extent of 110 ft. from the croppings by 2 shafts, and is turning out considerable ore of a high grade. The owners have on dump about 75 tons of free milling ore. Assays have run as high as $480 per ton.

Bon Mine.—Active operations will be commenced in a few days. The ledge contains good milling ore, assaying about $150 per ton.

ELY DISTRICT.

Review—Bullion.—Ely *Record*, Oct. 20: The shipments for the week are $74,537.49.

Meadow Valley.—Sixty tons of high grade ore are daily raised. Most of it is from Nos. 3 and 7 shafts. The Summit or No. 5 shaft is being sunk, and is 315 ft. in depth. The working force numbers 130.

The Raymond & Ely is producing 120 tons per day. Of this 90 tons are first class and 30 tons second class. The first class yields on an average about $160, and the second $65 per ton. The regular bullion shipment is about $15,000 daily. The Lightner shaft is down 525 ft., and still sinking. A cross cut is being driven from the 525-ft. level, which is expected to cut the ledge daily. There are about 10,000 tons of ore on dump.

Portland.—The workings consist of a shaft 80 ft. in depth, from the bottom of which a drift has been run 107 ft., where it cuts the ledge. The vein matter occupies 9 ft. from wall to wall; of this fully 5½ ft. is ora, 2½ ft. being of the very finest character.

Pioche Champion.—The new shaft has reached 80 ft. A whim has been built, which answers excellently.

Bowery.—The shaft is down 216 ft. and sinking is progressing rapidly. Stations have been opened at 55 ft. and 150 ft. respectively.

Amanda Tunnel.—The last contract was completed last Thursday, having reached a length of 271 ft. A new contract has been let for another 100 ft. The winze on the ledge cut by the tunnel is 45 ft. deep, and shows a solid body of the very richest ore, 3½ ft. in width. Assays made daily during the present average $500 per ton.

Excelsior.—Last week this mine shipped bullion to the amount of $10,000; about 15 tons of ore is being raised daily and hauled to the Magnet mill. At the 80 and 100-ft. levels stoping is proceeding. A winze has been sunk from the 80-ft. and raised from the 100-ft. level to afford better ventilation.

Chief of the Hill.—Ore is being taken out of levels Nos. 1, 2 and 3. Winzes are being sunk in No. 3 level 100 ft. apart. Winze No. 1 down 56 ft.; No. 2, 48 ft., and No 3 is just commenced. From 8 to 10 tons are taken out daily.

Baltic.—The incline is down 90 ft.

American Flag.—Both sinking and drifting are being pushed. There are about 200 tons of ore on dump.

Washington & Creole.—Sinking on the incline, which is fully 550 ft. in depth.

Pacific Tunnel.—Ten ft. has been run during the past week, making a total of 1,012 ft. The ledge cut by the tunnel is well defined and 8 ft. wide, showing considerable low grade ore.

Pioche.—On Monday this Co. will commence hauling ore to the mill, 100 tons of which are already on the dump. Ore is being taken out in the upper levels, while prospecting is going on in the 460 and 230-ft. levels.

Meadow Valley—East Ex.—Work is being prosecuted on the ledges struck in the cross cut. The winze is 32 ft. in depth.

Kingston.—A contract has been let to timber this shaft from top to bottom, a depth of 250 ft.

Mazeppa.—The working incline has reached 80 ft.

Orleans.—The incline is 185 ft. deep and shows a large ledge with some ore.

Jolly Travellers.—The vertical shaft is 100 ft. deep. In the lower portion some very rich strata of ore have been cut.

Pioche—West.—Vertical shaft is being sunk, which has attained 225 ft., about 15 ft. being made during the week.

Lillian Hall.—The west drift is in 75 ft., and shows some ore, but not of a high grade.

Arkansas.—During the week 15 ft. has been added to the depth of the shaft, making a total of 330 ft.

Spring Mount.—The shaft is a little over 300 ft. deep. Sinking is progressing.

Ingomar.—The contractors are sinking the shaft, and have attained nearly 500 ft.

HUMBOLDT.

Bullion.—Unionville *Silver-Slate*, Oct. 25.—Amount shipped from the Arizona since our last issue, was $7,720.

Battle Mt.—It is asserted that the yield of the White and Shiloh Con., during Sept., equaled $30,000.

REESE RIVER.

Reese River *Reveille*, Oct, 19.—Lone Star.—Sinking an incline from the 127 ft. level and getting first-rate ore.

Isabella.—The Ogden incline is being pushed rapidly; good ore coming from the O'Connell ledge; new lease let on the Isabella ledge, 25 men at work.

King Alfred.—The large shaft is being sunk fast day and night.

Grove Tunnel.—Kane and Ledolph, lessees at the 200 ft. east level, have a fine ledge, are getting elegant ore, and have about 15 tons of high-grade rock on hand. Hopley & Co., are also getting fair ore. Cahaley & Co., in 250 ft. level are getting magnificent ore.

Whitlach Union.—Breasting in the ore chamber continues.

Gen. Grant.—Very rich and in fine condition.

Jane Lenoe.—Some good ore is coming from the 100 ft. level.

Dollarhide.—Ashley and McAffee are engaged in freeing the mine from water.

Reed's Tunnel.—Good ore is coming from the incline, west from the tunnel; considerable amount of ore on hand.

North River Tunnel.—Driving ahead on the North River ledge and getting ore.

Iowa Tunnel.—Foxworthy and Co., had a crushing last week, the first class of which worked at the rate of $1,600 per ton.

Freehold.—Enlarging the shaft, expect to get steam hoisting works up next week.

Morgan and Muncey.—A new ledge is coming in on top of the old one.

Savannah.—Putting down the shaft steadily. A new reel is to be placed in soon.

Saratoga.—Working at both the east and west 340 ft. levels; good ore coming from both.

BELMONT.

El Dorado Co.—Commenced stoping out some very fine ore from the chimney north of Main incline on 340 ft. level; also raising on a stratum of fine ore from same level near incline. Contractors pushing the 400 ft. level southerly with fair prospects of reaching the large chimney which is exposed on level above. This Co. is working in the El Dorado and Arizona mines some 40 men, and on the mill over 20 men.

Monitor Co.—Have their tunnel No. 2, in over 460 ft; have about 40 ft. yet to cut the vein. Taking out very rich ores from the upper levels. Working on mine and mill about 54 men.

WASHOE.

Summary. — Gold Hill *News*, October 26: Belcher. — Hoisting through the incline by means of the new hoisting works, from the lower levels, commenced yesterday. About 130 tons per day continues to be hoisted through the Yellow Jacket shaft. The drift north at the 100-ft. level is in 198 ft. from the shaft, and the drift south from the ore-stopes to connect with it is in 242 ft. from the Crown Point line. The main incline is still sinking, and is down 80 ft. below the 1100-ft. level. The south drift at the 1200-ft. level is in 167 ft. from the Crown Point line, and at 200 ft. from that line a winze is about being commenced at the 1100-ft. level to intersect the drift or level below for ventilation, ore-hoisting, etc.

Woodville.—Daily yield 14 tons of high-grade ore. The ledge is 18 ft. wide.

Crown Point.—Developments at the lowest or 1300-ft. level are going ahead and turning out very satisfactorily, assays averaging over $100 to the ton. The Rhode Island, Sapphire and Petaluma mills, Gold Canon, are being run on ore from this mine.

Cons. Virginia.—Yesterday the work of sinking the shaft for a new level was resumed. The main west drift on the 1167-ft. level is pushed steadily ahead, still in porphyry. The cross-cuts south on the 500-ft. level are in low grade ore.

Crown Point Ravine.—Has a shaft 300 ft. deep, with a drift west from the bottom 40 ft. cutting the ledge.

Chollar-Potosi.— Daily yield 150 tons worth $27 per ton. The ore brests are not yielding as well as usual, and the ore is of lower grade. The main shaft is cleaned out and repaired to within 8 ft. of the head of the incline.

Sierra Nevada.—Daily yield 50 tons. Ore breasts in the upper and middle portions of mine are yielding well. The prospecting drift on the 500-ft. level is being pushed ahead.

Buckeye.—At the 3d and 4th levels the ore deposits are showing better as developed. The prospecting drifts at other points are progressing favorably.

Yellow Jacket.—The pump will commence draining the water from the lower levels next week. The drift north at the 1,300-ft. level is driving ahead, also the cross-cut east.

Knickerbocker.—The main west drift is in 249 ft. having made 25 ft. during the week.

Savage.—Sinking the incline is making fair progress. Daily yield of ore 155 tons, worth $27 per ton.

Union Cons.—Work in the north drift from the bottom of winze is suspended for the present. Work in the main west tunnel progresses steadily; in 290 ft.

Insurance.—Good headway is being made in sinking the incline.

Senator.—The shaft is down 220 ft. in good sinking ground, and making excellent progress.

WHITE PINE.

Bullion.—White Pine *News*, Oct. 19: The shipments during the past week, was $7,298.02.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—The Eberhardt and Blue Bell shafts are sinking. In the Risdale and De Pase chambers the drifting from the bottom of the Risdale shaft to connect with the South Aurora tunnel, has been made. One load of ore is shipped to the Big Smoky mill daily. Working in the South chamber from the Lady's chamber, the ore being high grade, and making the usual shipments daily to mill.

Beecher Cons. M. & M. Co.—The ore in the old Blasdel works continues to hold out, and the regular shipment of rock to mill is made. In the Beecher works it is supposed a body of ore has been struck.

O. H. Treasure M.—The various workings are looking well.

Sunbeam—Continues sinking in the Moscow shaft, and running a little to the south in quartz.

East Sheroygan.—A drift is being pushed ahead to form a connection with the southwest drift, with favorable indications of getting ore.

Mammoth.—The bottom of the shaft is looking well, and down about 55 ft. in good ore.

Silver Plate.— Running in the tunnel, which is over 50 ft. deep, and in good ore.

Outside Dists.—The Canton Co.'s furnace will start up to-morrow, Sunday.

The Emma is taking out good ore of a high grade. The Troy, the first extension on the Hayes, has struck a body of high-grade ore in the shaft at a depth of 28 ft.

Mills—Big Smoky.—Running on ore from the Eberhardt & Aurora Co.'s mines.

Manhattan.—Running steadily on ore from the Beecher Cons. Co.'s mines.

Tailings Mill.—This mill is running on tailings from the Oasis mill, at Shermantown—working about 40 tons daily.

Schell Creek — McMahon.— Schell Creek *Prospect*, Oct. 19: The shaft is down 90 ft. from the croppings and shows ore of fine quality at the bottom. There are 2 shifts, 4 men on each working on it daily. The tunnel is in about 70 ft. There is a large quantity of ore on

Jupiter.—The shaft is down about 58 ft. showing good average ore at the bottom. The tunnel is in 62 ft., but does not show much ore.

Kavanagh Tunnel.—Is in 98 ft., the face showing a quantity of decomposed quartz.

Summit.—Men will be set to work in the course of a few days.

Tehama.—The tunnel is in about 325 ft. in decomposed quartz. The dump is pretty well filled with average ore. The mill will be finished in 3 weeks.

Schell Creek.—Running tunnel which is in some 230 ft. some quartz showing in the face. Three shifts to work daily.

Albert.—Working steadily on tunnel which is in about 65 ft. showing indications of soon striking ore. Ten men at work.

Queen Springs—Labross Tunnel.—Is in 200 ft. showing some quartz in face. The owners intend running it 200 ft. further. Two shifts are working.

Nutmeg.—Men will soon be put to work. A large quantity of ore on dump.

San Francisco.— The shaft is down 50 ft. showing very well; considerable ore on dump.

Silver Canon—Clayton.—There has been a tunnel started on the ledge following it into the hill, which is 30 ft. in quartz. The ledge is about 4 ft. thick.

Grace.—An opening has been made into the ledge some 14 ft. in length through good ore, a large quantity of which has been extracted and is on dump.

Silver Gate.—Shows a well-defined ledge of high-grade ore, about 5 tons on dump.

Arizona.

Mines and Mining.—Prescott *Miner*, Oct. 12: On the War Eagle a tunnel 28 ft. in length has been run, and between 12 and 15 ft. of it is in vein matter.

The Arastras at Weaver are running and grinding out considerable gold dust.

The placer miners around Prescott are making a living, and not much more, owing to the scarcity of water.

Z. Jackson told us that the seven days he was enabled to work his hydraulic diggings on Lower Lynx Creek, he with two other men washed out $800 in gold. Again, Mr. Lovejoy and two other men worked 3 days and 3 hours, the past summer, and made $375.

Colorado.

Bullion.— Colorado *Miner*, Oct. 17: The Stewart S. R. Co. have shipped since their last report 6 bars, valued at $5,259.36.

Idaho.—Collom's Concentration works, are rapidly approaching completion.

In Hukill Gulch the Fairmont Co. is putting up smelting furnaces of considerable capacity.

The Swansea furnaces at the Whale Mill are in successful operation.

The Victor is yielding large quantities of rich ore.

The Crisis has been recently sold.

On the Monteuse, Virginia Cañon, L. Cannon has let contracts for sinking a shaft to a considerable depth, and for driving a tunnel on the lode, 260 ft. The surface ore from this lode assays about 40 ozs in gold.

The Little Emma, a recent discovery, promises extremely well already. The owner has taken out considerable quantities of ore which averages 100 ozs in silver and ½ oz in gold.

The Edgar is yielding ores which carry a large per cent. of lead, and are worth about $100 in silver.

Up Chicago Creek, Cascade dist., Miller and Meade are driving the Essex Tunnel, with a small force; Lewis and Fuqua are working the Cascade, and O. Fallon, the Dublin Tunnel.

Minnesota.—The rich ore found in the south winze continues as they go down, and the foreman says as soon as the fourth level drift and this winze is connected, he will be able to take out enough $40 ore to run 10 stamps.

War Eagle.—We saw some fine specimens of sulphuret ores from the fourth level stopes south, where the vein is small, but very rich. The fifth level drifts are going in rapidly.

Items.—Swett & Gray have driven the Silver Bank tunnel 84¼ feet into Republican.

The Mammoth is being worked successfully.

The Glasgow is looking well. A four inch vein of solid mineral, very rich in sulphurets of silver, is in sight.

In one of the lodes of the Bruce tunnel, a good paying vein of mineral has been struck.

Montana.

Clean Up.—Helena *Gazette*, Oct. 14: Hobbs & Magarrity made a clean up from 100 tons of their quartz from the Eveline lodge, on the Park, this week, which yielded $5,400

French Gulch.—Deer Lodge *Independent*, Oct. 19: Mr. Allen is making from $10 to $18 to the hand.

Gilchrist has a number of men engaged in sinking a shaft upon the Parrott ledge near Butte City. The shaft is down 40 ft. and will be continued until a depth of 100 ft. is reached. Then levels will be run and the work of stoping begin.

We are informed that a new ditch will be constructed this winter across the main range, from Boulder creek to Carihoo gulch.

California gulch are realizing about $20 per day to the hand.

Washington Gulch.—From 40 to 50 men are working, and some of the claims are paying very well.

The American Flat Tunnel.—The American Flat Tunnel, on the Virginia and Truckee Railroad which was burnt out a few weeks ago is being rapidly cleared out and put in order. The south end caved very badly and the tunnel is probably blocked up solid for 150 feet or more. The Gold Hill *News* says that it will take some weeks yet to clear that out.

Academy of Sciences.

The regular semi-moutbly msstiug of the Academy was held on tbe 21st inst., Professor Geo. Davidson in tbe chair. The following nnusually large number of new members were elected: Louis C. Haggin, J. H. Weeden, Rev. Horatio Stebbins, Andrew McF. Davis, Wm. H. Foster, Jr., Wm. B. Thornbnrg, M. Jasper McDonald, Wm. Leffingwell, Wm. Doolan, E. D. DeCrano, John Perry, Jr., Wm. H. Seers, Capt. J. M. McDonald, H. J. Stewart, Morton W. Saunders, W. J. Miller, Wm. Lane Booksr, Jndgs Jobn Curry, G. S. Johnson, Dr. Wm. Calvert, Henry M. Fisk, M. D., B. F. Ellis, Henry P. Bowie. Messrs William Burling and Edward F. Hall were elscted life members. This is the largsst numbsr of msmbers admitted to the Academy in one evening since its formation.

Donations to the Cabinet.

Among the donations to tbe Cabinet was the head of a wbite-tailed deer, killed in the Coast Range of Monntains, fifteen milss west of Tnlare Lake. It was shot by Mr. John P. Walton, who says that it is tbs only specimen with a white tail tbat he had seen, among a thousand shot by him. When dressed it wsighed one hundred and seventy-five ponnds.

A large bonlder fonnd by Professor Davidson at San Pedro, was prssented, which contained fossil remains. Its peculiarity is simply tbat it resembls certain forms of a vsry ancient fossil, found in the *Laurentian* rocks of the Island of Anticosti, in ths Gulf of St. Lawrence. It is the first specimsn of the kind ever found in any other place.

A paper was pressnted by Dr. Dall, of tbe Coast Survey, entitled "A supplement to the revision of ths *Teretratulidae*, with additions, corrections, and a revision of ths *Craniidæ* and *Discinidæ*." Professor Davidson also presented his "Report of the examination of weights and balances of the Branch Mint of the United States. Mr. Bloomer showed a nsw species of fern called *Botrychium*, or "moonwort." There are bnt fonr specics of the genus recorded in onr botanical works. Its usual birth-places are in monntain meadows and pastures. Tbis specimen was collected by Mr. J. W. Dun, near Emigrant Gap—altitude about 5,000 feet. Mr. Bloomer also sbowed a standard antiquarian work on botany, 260 years old.

A Curiosity.

The Secretary read some extracts from the published proceedings of the Academy concerning wbat appeared to be a bundle of willow rods which were sent to the Academy some time since. Tbey were received in May, 1871, from Burrard's Inlet, Vancouver's Island. At the time tbey were sent no information concerning them could be obtained other than that tbey were tbe skeletons of some kind of fish. The "rods" were thought by some to be a species of *Zoophyte* allied to *Vulgaria*. At a meeting in July, 1871, a letter was read from George Dietz of Victoria, which stated that the bones supposed to be *Vulgaria*, were taken from a species of fish of the eel order, by fishermen near Burrard's Inlet. Dr. Blake tbought at the time that the "rods" were not fish-bouea bnt sponges, probably of a new form. He said tbey were interesting, from the fact tbat there were bnt two other *genera* which at all resembled them and which were peculiar to the Pacific.

In the 26th ofSeptember number of *Nature*, an article appeared which was the substance of a paper read by P. L. Sclater, before the British Association at Brighton in August. That gentleman had received some of the same kind of specimens, which looked like long, thinpeeled willow wands a quarter of an inch in diameter at the thick end. He thought they were of animal origin and was inclined to regard them as possibly the bones of some of the gigantio Rays. Mr. Sclater sent some of the specimens to Professor Kollicker of Wurburg, who had been engaged on a monograph of the Peunatulidæ. He said the specimens were new to him and thought they were of a new genus.

Captain Hnrd wrote to Mr. Sclater from the locality where tbey were found and described the "rods" as the back-bones of a sort of fieh whicb abounded there. The animals were shaped like a conger eel, but were quite transparent, their bodies being composed of a sort of jelly and about eight inches in diameter. The head is like a shark's; it is attached to the thick end of the rod or back-bone; it has two eyes and a mouth placed low down. The back-bone is also transparent in tbe living animal, but becomea bard when dried on the beach. The fish were said to swim about in shoals with the dog-fish. Mr. Sclater says he can only suggest that the "roda" may be the hardened notocords of a low, organized fish, allied either to the *Chimaeroids* or to the Lamprey, in which the notocord is persistent through life. It was evident that the object was quite unknown to science and it was very desirable to obtain a complete specimen.

Dr. Blake said he had sent to several parties in Burrard's Inlet, in order to obtain a specimen, and had not succeeded in doing so, they answering that it was impossible to procure any. The "rods" burn aud smell like bone, bnt the Doctor wonld not he certain until he had seen a specimen.

Professor Davidson then read and solved some

New Problems in Mensuration,

Which were as follows:

1. Given, the two diameters of the zone of a circls, to divide ths area of the zone into two zones of eqnal areas, in terms of the givsn diameter.

2. Given, tbe diameter of the zone of a circle to be divided into two zones of eqnal area, to obtain the diameters of a consecutive series of zones of equal arsas with each of the two zones, within the smaller and without the larger diamstars of tbe given zone, in terms of the two given diameters.

3. Given, the diameter of the zone of a circls, to divide the zone into two, three or more zonss of eqnal area, in terms of the two diameters.

4. Given, tbe diameter of a circle, to divide the area thereof into any nnmber of zones of eqnal area with each otber, in terms of the given diameter.

Dr. Blake's remarks on the "Topography of the Great Basin," will bs found in another column.

Economical Mining.

We ars almost daily reminded of the fact, says the *Mining World*, tbat manual labor is as expensive a mode of conducting mining opsrations as can possibly bs dsvissd. Mining captains ssem to be qnite deficient in enginesring, or mining companies are slow to nndsrstand the economies and ntilities of modsrn appliancss, else we wonld find them in more gsneral nss. Evsry device which ingenuity can snggest should bs introduced to reduce mannal labor, and all the rssources of mechanism at command, and applicable to mining purposes, sbould bs adopted in order to be abls to mine at great dspths as cheaply, or nsarly as cbeaply, as nearer ths snrfacs. It has been fnlly demonstrated tbat the most profitabls mining is that wbich yields tbe best ores, and that the ores of tbe best mines extsnd to a great depth in the earth—except in the case of the soft bematites—and therefore tbe bsst appliances of engineering skill are necsssary to master the work and bave it done economically.

We know that the greatest objection raised against our argument will be that the limited amount of capital set apart for the developing of mines, will not allow the mining engineer to furnish himself with such facilities as be tbinks he needs; but while we will admit that this is a fair reason wby improvements bave not been introduced, we will not admit that the reason is valid. No company should undertake a large enterprise with the expectation of making it a success without being prepsred to meet all tbe demanda which may be made against it for facilities for operation; and it will usually be fonnd tbat where too great economy is used for tbe purposea of profit, loss is likely to follow, Thus the doctrine should be, to eqnip every mine which is worth working with all the labor-saving machinery which can in any way be adapted to the circumstances, to take the place of hnman mnscle. Tbere is now a gensrsl complaint regarding the scarcity of men, and tbis complaint will continne and intensify until machinery is more generally nsed.

Colorado's Mining Outlook.

A well-informed and scientific gentleman from New York City, who has spent several weeks in a close and critical examinaaion of our mining interests, has kindly given us a brief extract of his conclusions, which will be read with interest. He says:

Although the mining business in Colorado has been disastrous to many in the past, and may be to more in the future, a better day is breaking. The minea are good and always have been. Tbegold and silver is here and in pleuty. The trouble has been so far that the mining has been done ignorantly and extravagantly, and ignorance and extravagance would ruin any business, east or west, no matter what the capital to back it. All the later changes, however, conduce to economy and saving. For a long time the old way of developing a mine was to sink a shaft and take ont the ore through the moutb, working down at an immense loss of power and time. Now they have learned to tunnel in at the foot of the hill, strike the vein far down and work np. Tbis method not only saves power and time, in getting out the ore, bnt makes the mine self-draining and dispenses with pumping.

We now see hnge tunnels built throngh the larger and richer hills, not to strike one vein, bnt all that may be in the hill. Improved reduction works are also being set up, which by the nse of new and more scientific processes, save a large percentage of the ore. Heretofore the methoda of reducing have been rnde, wasteful and ignorant. Again, tbe multiplication of tbeir works by breaking np monopoly, rednces the cost of the mine, and ensnres a large and profitable return.

The above ontlook over the past and pres ent is equally correct and gratifying. Profiting by tbe errors and waste of the earlier days, we may safely anticipate snch retnrns from our mines as will make them rank with the richest and most profitable the world has ever known.—*Denver Tribune.*

The Price of Tin.

Tin and tinned iron have continned to rise throughout ths United States during the year, and thsy will continne so to rise. Ths advance has an important effect on the prosecution of many industries, notably that of fruit, meat, and fisb canning, which on this coast, as well through the United States, forms an important and flourisbing manufacturing interest. For many months the prics of all classes of goods of this kind has risen in consequencs of the advance in tin and iron. That advance has been caused by the immense increase in the demsnd for tinned iron, tbat has sprung np this year, particnlsrly in this conntry. England is ths great source of tin eupply to Europe and America, and the produce of ths tin mines of the East-Indian Archipelago passss through the hands of her merchants before it can reach the consnmer. Hsnce, the ratss prevailing in tbe English market, give tbe tone to those of almost all the rest of ths world. Now France has required this year five times the quantity tbat she did last year, and tbe Unitsd States twice as much. In fact, of 14,525 tons exported from Grsat Britain in the month of May last, 12,055 tons were exportsd to this conntry, and of 43,391 tons exported dnring the first five montbs of 1872, tbe United States took four-fifths. The fluctuations in the price of tin for the last twenty years have been vsry great. In 1849, block tin was worth in England $384 per ton, subsequently fell to $204, and is to-day $758.40. As compared with last year, pressnt quotations are as follows:

	1872.	1871.
Eng. Land F. Ingots	$758 40	$648 00
" Bars in Barrels...	763 20	652 80
" Rsfined.....	768 00	657 60
Banca.....	768 00	652 80
Straits.....	724 80	632 80

This shows a large advance, and we will, before long, have to report a larger, as the English mins owners are keeping back tbe ore so as to secnre high rates. The miners have been emigrating largely for sometims past; as a consequencs, wages havs risen, and thsy insist, that in order to prevent a rednction of profits, prices mnst rise also. The consideration of these facts ongbt to givs an impstus to the development of tbe tin mines of this coast.

Canal and Narrow Gauge R. R. Combined.—Among the designs exhibited at tbe late State Fair is one very modest in appearance, but full of merit, by George G. W. Morgan, of Sacramento. It is for a canal and single track, narrow gauge railroad combined. Tbis plan, it appears, is in successful operation in Switzerland, and can he built at a very small expense. A canal would reclaim onr waste lands, transport freight at a minimum rate, open np new towns and cities — like the Erie canal of New York—and be a never ending source of wealth to the State.—*Sacramento Union.*

Mining and Farming.—The Nevada *Transcript* says: John Schmidt owns a qnartz ledge on Wood's Ravine, which for more than a year himself and his two boys have worked with little help, and at little expense. He raises grapes on top of the gronnd and gets gold below the roots of his vines. Tbey have taken ont considerable money, and have now a fine ledge of quartz which pays $50 per ton. He has taken out at times several hundred dollars in a day.

Quicksilver Mines of India.—The following shows the steady increase of the annual produce of mercury from these mines:

In the year	1865.....	302,300 lbs.
"	1866.....	323,100 "
"	1867.....	463,900 "
"	1868.....	512,100 "
"	1869.....	566,400 "
"	1870.....	661,800 "
"	1871.....	000,000 "

(Austrian commercial weight,)

An Ingenious Apparatus has been invented hy a French physician, hy which the heart is made to register photographically its own pulsations. Snch, it is said, is the peculiarity of the apparatus, in its adaptation to different uses, that it may be modified so as to register the variations of the respiration, the irregular action of conghing, and similar physiological phenomena.

Coal Lands.—The Commissioner of the General Land Office bas decided that coal lands are mineral lands, and snbject to sale as snch. This decision waa made on an appeal taken hy some parties wishing coal lands on tracts claimed under tbe land grant of the Coos Bay Wagon Road.

Another Immense Bridge.—It is proposed to throw an immense bridge over the Hudson river at Poughkepsie. The bridge will be composed of five spans of five hundred feet eacb, and it will be one bnndred and twenty feet in hight. It will connect New England with the coal-fields of Pennsylvania.

Weight of Woons.—Ebony wood weigbs 83 pounds to the cubic foot; lignumvitæ, the same; hickory, 52 pounds; birch, 45 ponnds; beech, 40; yellow pine, 38; cedar, 28; white pine, 35: and cork, 15.

The secret pleasure of a generous act is the great mind's great bribe.

Pudrolithe—The Safety Blasting Powder.

The importance to minsrs of a cheap and reliable means of fracturing the rocks met with in the course of their operations is so generally acknowledged that for some years past the attention of chemical invsntors has been turned to the production of blasting componnds at once cheaper and more powerfnl than ordinary gunpowder, and amongst the more recently introdnced matsrials resulting from thsse inventive efforts pndrolithe will, it is anticipated, take prominent position. Pudroliths, it appears, has bssn largely nsed in Belgium for blasting purposss during the past year or two, and has given the grsatest satisfaction to all who have tried it; it bas now been tested in this country, and with equally favorable rsults; so that, assuming the extraordinary properties claimed for it to bs proved, thsre need hs little doubt that it will quickly become an article of great commsrcial importance. The material is said to bs non-liable to explosion sithsr hy friction or percussion; it can be hammered npon an anvil without danger, and is altogether so harmless when uncompresssd that it can be fired by the naked hand with a common cigar-light without causing explosion, whilst should it accidsntaly becoms damp it can be dried on a bot plate without danger, and without injury to its blasting power.

During tbe past few weeks experiments have been made at Llanymynecb, in Wales, and at Lamora, in Cornwall, and tbe workmen appear to be as satisfied with the properties as could be dssired. Ths experiments were, in both instances, conducted by Mr. Poch, tbs son of the inventor; and still more recently anotber trial was made at the Trswollack Minss, St. Columb, whers, the shots being fired in an ordinary end, sven more reliable conclusions as to its merits could bs formed. In order to show the agents and miners how free from smoke the levsl would be (even when not well ventilated), as well as to exhibit tbs strength of the componnd, two 18-in. holes wers bored, which wonld bave nscessitated ten inches of blasting powder. Into these holea seven in. only of pudrolithe was tamped, and they were fired simultaneonsly. Tbe hard blue killas (than whicb scarcely any ground tougher could have been selected) is said to have been literally ripped np, the action of the explosion being downwards chiefly, and in five minutes—timed particularly—the agent, with his chief pitman, went in and declared the level more free from smoke than wonld have been tbe case with ordinary blasting powder after twenty minutes had elapsed from the time of the explosion. The men at once commenced clearing the end. Miners will judge of the probable character of the end when it is stated that the level was rnn in from the engine-shaft about 90 fms., and had no other communication with the surface.

In the experiments at Mr. Savin's lime rock, at Llanymynecb, as in tbose at Messrs. John Freeman and Son's granite qnarries at Lamorna, and those just alluded to, the quantity of tbe pudrolithe used was about two-thirds the ordinary charge of gunpowder; that is to say, if a hole were considered to require 18 in. of ordinary blasting-powder, 12 in. of pndrolitbe; and similarly 14 in. of pudrolithe iustead of 21 inches of powder, and so on. But tbe great advantages claimed for pudrolithe are that it may be stored away for any period, conveyed in any manner by land or water, and snbjected to all temperatures of climate without possibility of explosion or injury; and that its manufacture is unattended by danger, which appears inseparable from the mannfactnre of ordinary blasting powder and most other explosive compounds, whilst it can be supplied at a price much below that of any blasting material at present in the market.—*London Mining Jour.*

Wire Tramways in Austria.—The transport of compressed turf to Gratzen, a station on the Austrian Francis-Joseph Railway, in Bohemia, is now effected by a line of Hodgson's Wire Tramway, 4,360 metres, or about 2¾ miles in length, The steel wire cable is 15 millimetres in diameter, supported on pulleys placed abont 68 yards apart, and rnnning ronnd horizontal wheels at the extremities, one metre in diameter, of which one is driven by a 10-borse-power portable engine, at the station end. In a working day of ten honrs, five or six men can thus transport from 1 to 500,000 kilogrammes (100 to 500 tons) at a epeed of six to eight feet per second, and at a cost of about 3d. per ton, per kilometre, nearly 5d. per mile. The cost of construction was 13,125 rf. per kilometre, or £850 per mile.

When Shall Manufacturers Pay Their Employees?—Rochester, October 16th.—At tbe State Congregational Convention to-day, the following was offered for consideration:

Whereas, The experience of manufacturers and other employers, both in Europe and America, proves that the payment of employés on Monday instead of Saturday results in a better observance of the Sabbath, less intemperance, and marked moral and pbysical and financial improvement, both of the establishments and the localities where it is practiced:

Resolved, That the subject is worthy of the careful consideration of patriots and Christian people.

Useful Information.

Water—What Might Happen.

Water is the great mechanical power in natnre. It is the great leveler; it moves moontains and fills valleys. All onr stratified rocks, sandstones, slates, and limestonea were formed by the action of water. To the solvent power of water and its chemical action we owe our nseful minerals, our metallic deposits, our iron, copper, zioc, gold and silver ores, and even coal. To its physical properties—its relations to heat, we owe all the phenomena of clonde dew, rain, fog, snow, and froet. It snpports the plants and briugs them their mineral food from the soil, and protects them from excessive heat. Animals are eqnally dependent upon it. Yet after all, it is only the agent of the snn; it ie snn power that makes plante grow; it ie sun power that moves everything in the world, and water is merely the eun's agent.

The loss of water upon the earth wonld produce the same condition of things on the earth that we notice now in the moon. Although we have snch a vast quantity of water, yet it is only 1-240,000 part of the earth, or 0·0042 per cent. The crystalline rocks at the earth's surface now contain a larger qnantity of water than this, and tho moment our earth cools enongh to absorb four-thonsandths of one per cent. of moistnre, the ocean will disappear. If we should lose our ocean, we shall lose our atmosphere also; the openings or poree in the rocks will receive it hy gravitation, and wo shall have the same condition of things as now exists in the moon.

How to Photograph Leaves.—Get two bits' worth hi-chromate of potash from the druggist and dissolve it in a two-ounce vial of soft water: pour off some of the liquid into a shallow dish; on this float a piece of ordinary writing-paper uutil it is thoroughly and evenly moistened. Take it from the water and let it become nearly dry *in the dark;* it will then be of a bright yellow color. On this prepared paper place the leaf to he photographed, and under it a piece of soft black cloth, and several thicknesses of newspaper. Pnt the whole between two pieces of glass and fasten together at the edge (say with spring clothes-pins). Now expose to a bright eun-light, placing the glass so that the snu will directly fall upon the leaf. In a few minutes it will hegin to turn hlack; bnt it requires from thirty minutes to several hours (according to the light, etc.,) to prodnce a perfect print. When the print has become dark enough, take the paper out and put it in clear water, which must be changed every few minutes till the yellow part becomes perfectly white. If the work is well done, the veins of the leaf will appear very distinct.

Cement for Fixing Glass Letters.—Some say a solution of shellac in methylated spirits will be snfficient, and also water-proof. Others recommend the following cement: Powdered orange shellac, 1 oz; alcohol. 2 oz. Place the containing hottle in a warm place. Agitate frequently until all the lac is dissolved. Apply cold. This will resist wet, and will cement strongly metals, wood, porcelain, glass, etc.

Then, again, it is eaid a thick solution of marine gluein naphtha will answer perfectly if color is no object. But the glass mnst be chemically clean, and thie is not always easy. The least trace of soap or grease will spoil the adhesion of any cement. Try soda or ammonia, followed by whiting and water, clean clothes, and plenty of rubhing, and let the cement dry on the letters till the surface just hegine to he "tacky" before yon apply them. Many excellent recipes fail on a fret trial, from the omission of some minnte precautions which are of more importance than some enppose.

Summer Temperature of San Francisco and Phiaadelphia.—The hottest noon-day temperatnre of July, at Philadelphia, was 98°, and the coldest 69°. The warmest noon-day temperature at San Francisco was 69°, with the exception of a single day when it was 71°. The coldest was 60°. So the warmest days in the latter place correspond almost exactly with the coldest in the former. Whilst Philadelphians were dropping in the street from sun-stroke, San Franciscans, though more than two degrees farther from the Pole, clad in cloth and flannels, were huttoning their coats and shivering in the chill wind.

Curious Facts about Oxide of Iron.—Oxide of iron when freshly formed freely absorbs the sulphuretted hydrogen or fonl gas, thne forming the hlack sulphide of iron; this, when exposed to the atmosphere, deposite its sulphur, and by the absorption of oxygen hecomes converted again into the oxide of iron. The sulphur which it had before taken in as sulphnretted hydrogen is thns set free among the particles of oxides, which, by a snccession of fonlings and revivificatione, hecomes so charged and clogged with inert sulphur that the air loses the power to restore it.

To Bleach Feathers. — First clean from greasy matter, then place the feathere in a dilute eolution of hichromate of potaeea, to whioh a little nitric acid has been added. The greenish depoeit of eesquioxyd whioh enenee may he removed by weak sulphuric acid, when the feathers will be left perfeotly white.

What Some People Drink. — Dr. Hodges, of Belfast, has recently had occasoin to analyze several samples of "whiskey," and has published the results of his examination in the *Dublin Evening Mail.* A bottle of whiskey, described as a fair sample of the drink sold in low-class pnhlic honees, was on examinstion found to he heavily adolterated with naphtha, cayenne pepper and vitriol. Another sample was composed almost entirely of naphtha, slightly colored with gennine whiskey; and a third delectahle compound had not even a "coloring" of the genuine spirit, heiog a pleasiog combination of cayenne pepper, oil of vitriol, alcohol, and sulphate of copper, which could he produced by any amateur ohemist at the rate of one penny per gallon. After this, one ie not enrprised to learn that the physical reeults of the consumption of this diabolical decoction are "frightful."

New-Fibaous Mateaial.—J. Schreiber & Co. of San Francisco have recently taken ont a patent for the working of the inner hark of Port Orford cedar into material snitable for upholsterers' stock and paper stock. The bark has a long and tongh fibre, is quite soft and elastic when beaten up or otherwise prepared. Pulu is going ont of nse as a cheap hedding material. If cedar bark is cleaner and hetter it may come into extensive use. There is an abundance of this hark wherever there are eawmills in operation. A clean, soft, elastio and cheap hedding material has long been wanted. It is possible that this want is to be met in the new preparation of cedar hark.

An Extraordinary Lake.—Lake Kenks, or Crooked Lake, sitnated in the center of the grape region of Weetern New York, is 487 feet ahove the level of the Atlantic. Its length is 22 miles and its greatest hreadth 1¼ miles. The ontlet which flows into Seneca lake has a descent of 270 feet in 7 miles. Once every year, nsnally in May, the lake purifies its waters by throwing to the surface a yellow substanco, which extends and emells like sulphur and gradnally extends until the face of the entire lake ie oovered. Thie remains about a week and then snddenly disappears in a day, and is not seen again until the next season.

A Varnish to Imitate Ground Glass.—Dissolve 90 grains of sandaric and 20 grains of mastic in two ounces of washed methylated ether, and add, in small quantites, a sufficiency of henzine to make it dry with a snitable grain —too little making the varnish too transparent, and an excess making it crapy. The qnantity of henzine required depends upon its qnality—from half an ounce to an onnce and a half or even more; but the hest results are got with a medinm qnality. It is important to nse wssbed ether, free from spirit.

Excellent Varnish for Harness.—Pulverize and put in a jng or hottle half a pound to a ponnd of gum-shellac, cover with good alcohol, and cork tightly. In about two days, if shaken frequently, the gum will he dissolved and ready for use. If the liquid appers ae thick as thin molasses add more alcohol. To one quart of the varnish add one ounce of good lamphlackt and an ounce of gum camphor. An occasional coat of this is also good for rendering boots water-proof.—*Rural New Yorker.*

To Remove Tar and Resinous Substances. Dr. Brickerd (*Med. and Surg. Reporter*) discovered by accident that a mixtnre of powdered extract of liqnorice and oil of aniseed will quickly and effectually remove tar, Venice tnrpentine, pitch, etc., from glass, porcelain, and the skin, and is entirely harmless. For the latter purpose the mixture shonld he ahout the consistency of thick cream, and should he thoroughly applied; being followed by soap, warm soft water and a sponge.

A Cement to stop cracks in glase vessels to resist moisture and heat: Dissolve caeeine in cold eaturated solution of horax, and with this solution paste strips of hog's or hullock's hladder (softened in water) on the cracks of glass, and dry at a gentle heat; if the vessel is to he heated, coat the bladder on the outside hefore it has become quite dry, with a paste or rather concentrated solution of silicate of soda and quick lime or plaster of Paris.

Decay of Gutta-Percha.—It is a fact worth knowing that gutta-percha decays rapidly, and becomee hrittle and porons when dry and exposed to the light, hut under water appears to undergo no change whatever. Gntta-percha sunk in the sea for twenty yeare shows no sign of decay which may he regarded as a condition in which nature comes to the aid of mechanical and electrical science.

Illinois Timber for England.—The statement is made hy the Secretary of the Iowa Board of Agrionltnre that a short time since a single individnal, whose name is not given, entered into a contract to furnish the British Government with five million cubio ft. of white oak, all of whioh ie to he cnt from foreste within fifty miles of Cairo, Ill.

Paper labels on bottles may he preeerved hy rubbing them, when dry, with paraffine, and then smoothing them out with a glae rod.

A cubic foot of air weighs 522 grains. A cubic foot of water weighs 1,000 ounces.

Good Health.

Sleep the Best Stimulant.

The polpit, the bench, the har, the forum, have contribnted their legions of victims to drunken habits. The heautiful woman, the sweet singer, the conversationalist, the periodical writer have filled, hot too often, the drunkard's grave. Now that the prces has become such a great power iu the land, when the magazine mnst come out ou a certain day, and the daily newspapers at a fixed hour, nothing waits; everything must give way to the inexorahle call for copy, and, sick or well, disposed or indisposed, asleep or awake, the copy mnst come. The writer must compose his article, whether he feels like it or not; and if he is not iu a vein of writing, he must whip himself up to it hy the etimulus of drink. Some of the greatest writers in the country have confeseed to the practice on urgent occaeioos, of taking a sip of hrandy at the end of every page, or even oftener. It may have eecaped the general reader's notice that more men have died young who have heen connected with the New York press withiu ten years, and that, too, from intemperance, than in all other educational callings put together; young men whose talents have heen of the first order, and gave promise of a life of usefulness, honor and emineuce. The hest possible thiug for a man to do, when he feels too tired to perform a task or too weak to carry it through, ie to go to hed and sleep—a week if he can. This is the only true recuperation of hrain power, the only actual renewal of hrain force. Because, during sleep the brain is in a state of ease, in a condition to receive and appropriate particles of nutriment from the hlood which take the place of those which have been consumed in previous labor since the very act of thinking consumes, burns up solid particles, as every turn of the wheel or screw of the splendid steamer is the result of the consumption hy fire of the fuel in the furnace. That supply of consumed brain substance can only he had from the nutriment particles in the hlood which were ohtained from the food eaten previously —and the hrain is so constituted that it can hest receive and appropriate to itself those nutriment particles during the state of rest, of quiet and stilluess in sleep. Mere stimnlents supply nothing in themeelves—they only goad the brain, force it to a greater consumption of its snhstances, until that substance has been so fully exhausted that there is not power enough left to receive a supply, jnst as men are so near death hy thirst or starvation, that there is not power enough left to swallow anything—and all is over. The incapacity of the brain for receiving recuperative particles sometimes comes on with the rapidity of a stroke of lightning, and the man becomes mad in an instant loses seuse, and is an idiot. It was under circumstancee of this very sort, in the very middle of a sentence of great oratoricsl power, that one of the most eminent miods of the age forgot hie ideas, pressed his hand upon his forehead, and after a moment's silence said: "God, as with a eponge has blotted out my mind." Be assured, my readers, "There is rest for the weary" only in early and ahundant sleep, and wise and hsppy are they who have firmness enough to resolve that "By God's help I will seek it in no other way."—*Ex.*

How Long Should a Man Live.—According to Professor Faraday, the crime of suicide is very common in this age of the world, and he intimates that all who die uuder one hundred years of age may he charged with self-murder. Providence having originally intended man to live a century, would allow him to arrive at that advanced period if he did not kill himself by eating unwholesome food, allowing himself to he annoyed hy trifles, giving license to passions, and exposiug himself to accident. Flonrin advanced the theory that the duration of life is measured hy the time of growth. When once the hones and epiphysis are united, the hody grows no more, and it is at twenty years this union is effected in man. The natural termination of life is five removes from the several points. Man being twenty years in growing, lives five times twenty years, that ie to say, one hundred years; the camel is eight years in growing, lives five times eight years, that is to say forty years; the horse is five years in growing, and lives twenty-five years, aud so with other animals.

Carbolic Acin in Small Pox.—In a recent numher of the *Lancet*, Dr. Alexander Watson recorded eeveral cases of small pox and scarlet fever in which the external application of carholic acid met with marked success. In the csse of one patient with small pox, whom he saw at the period when papulæ appeared, he ordered an enema, and then had the patient (a girl of eleven years) sponged all over with carholic acid soap suds. On the next day a severe attack of confluent small pox was threatened, hnt the child was sponged as she had previously heen, and then her whole hody wae painted with carholic acid glycerine of the British Pharmacopœia. Five grains of Dover's powder were then given to allay irritability, and the little girl elept quietly for several houre, when she wae sponged again. No vesicles formed, and the patient was convalescent in a few daye. Carbolic acid was, in the meantime, plentifully used about the room.

Hemlock as a Poison.

How It Worked in the Case of Socrates.

No poison claims a higher antiquity or a greater historical interest than hemlock. To the physician there is nono that snrpssses it in physiological interest. The bare mention of the plant carriee ono back to the days of the Grecian republic, and recalls the undying name of Socrates, Theramenes, and Phocion—men who have suhmitted to the baneful influence of hemlock rather than betray the liberty of their country. If we would learn the effect of the Athenian State poison, we may have Plato for our teacher, and for a subject him of whom Cicero jnstly eaid "that he was the first who called down philoeophy from heaven to earth, and introduced her into the public walks and domestic retirements of men, that she might instruct them concering life and mannere." "Socratee," says Plato, "received the fatal cup withont change of countenance or the least perturhation. His executioner directed him to walk ahout until he ehould feel his legs becoming heavy. He did so until the chilliog operation compelled him to lie down; then it eeized upon the more vital parts. The executioner approached him, said to his friende that when the effects of the poisou would reach hie heart Socrates would depart. Then, uncovering him he found that the lower portion of the hody was cold. At this time Socrates spoke these last words to his friend Critto; "Critto we owe Esculapius a cock; pay the debt, and do not forget it," snd in a short time wae convulsed. The man then uncovered him; his eyes were fixed, and when Critto observed this, he closed his eye-lids and hie mouth.

In this account we have ample proof of the actiou of hemlock. The legs grow heavy, and the chilling effects creep on. The victim no longer able to stand, lies down; at last the respiration ceases, accompanied, as is nsual in such cases, hy a slight convulsive tremor, the mind remaining clear snd tranquil to the last.

Remedy for Wounds.

A correspondeut of the *Country Gentleman* gives the following as one of the best remedies known for the cure of wounds: "Take a pan or shovel with burning coals, and sprinkle upon them some common brown sugar, and hold the wounded part in the smoke. In a few minutes the pain will be allayed, and recovery proceed rapidly. In my own caee a rusty nail had made a bad wonnd in the bottom of my foot. The pain and nervous irritation were severe. This was all removed hy holding it in the smoke for fifteen minutes, and I was able to resume my reading in comfort. We have often recommended it to others, with like results. Lately, one of my men had a finger-nail torn ont hy a pair of ice tongs. It became very painful, as was to have heen expected. Held in sugar smoke for some twenty minutes, the pain ceased, and it promises speedy recovery."

This sounds very much like one of those remedies which need supplementing hy an abundant faith to produce their heneficial effect. The products of the imperfect combustion of sugar are water, carbonic acid, and a dense volume of carhon in the form of soot.

Remedies for Corns.—A correspondent of the *Country Gentleman* states that he has fonnd the following a simple and effectual remedy for corns. "Bathe the feet in tepid water, to soften the corns; pare these off very cloee with a sharp knife; then rub on well, green peach-tree leaves; when, after continning the rnhhing once or twice a day, the corns will disappear.

A good corn salve could no doubt be made for winter use, by bruising the peach leaves when green; then hoil them in water nntil the strength is extracted, then take out the leaves, strain the water off the sediment, add a sufficient quantity of resin, heeswax, tallow, aud lard oil to make it soft enough, and simmer down, without hurning, until the water is evapporated. Soften and pare the corn, as before directed, spread the ealve on a small piece of cambric or linen, and apply, putting on the sock or stockiug very carefully, so as not to rub it off. Keep applying until the corn disappears."

The following is a recent English recipe for the same purpose: Bathe the feet well in warm water, then with a sharp instrument pare off ae much of the corn as can he done without pain or causing it to bleed, and dress once a day with a salve made of hlack oxide of copper and lead in eqnal quantities.

Turpentine in Headache.—Dr. Warhnrton Beghie advocates the use of turpentine in the severe headache to which nervons and hysterical women are subject. There is another class of sufferers from headache, composed of hoth sexes, who may he relieved by turpentine. I refer to the frontal headache, which is most apt to occur after prolonged mental effort, hnt may likewise he induced hy nnduly sustained physical exertion—what may he styled the headache of a fatigued hrain. A cup of very strong tea often relieves this form of headache; hut this remedy, with not a few, is perilous, for, bringing relief to pain, it may produce general restlessnees and—worst of all—hanish sleep. Turpentine, in doses of twenty or thirty minims, given at intervals of an hour or two, will not only remove the headache, but produce in a wonderful manner that soothing influence to which reference has already been made.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	$3 00	7.50	20.00
One inch.....	2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 3s. 0d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Nov. 2, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Oct. 31, 1872.—Legal Tenders buying, 88¾; selling, 89⅛. Gold in New York to-day, 112⅝.

Table of Contents.

ILLUSTRATIONS.—Hands, 173. The Sutro Tunnel, 181-2.
EDITORIALS.—Mineral Land Decision; Narrow Gauge; The Diamond Question, 173. Academy of Sciences; The Price of Tin; Mechanics' Art College, 284.
MECHANICAL PROGRESS.—Fragrant Bisulphide of Carbon; Mechanical Skill in China; To Render Glue Waterproof; Tempering Steel; Wooden Shins; Relative Value of American and English Iron. 275.
SCIENTIFIC PROGRESS.—Dust Explosions in Flour Mills; How Trees are Killed by Lightning; Lightning in the Spectroscope; Cause of Change of Color in Fishes; A Beautiful Experiment; An Electric Telegraph in 1818. 275.
MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho and Montana; Mining Shareholders' Directory, 276-7. Market Reports, 284.
USEFUL INFORMATION.—Water—What Might Happen; How to Photograph Leaves; Cement for Fixing Glass Letters; Summer Temperature of San Francisco and Philadelphia; Curious Facts about Oxide of Iron; What Some People Drink; New Fibrous Material; An Extraordinary Lake; A Varnish to Imitate Ground Glass; Excellent Varnish for Harness; To Remove Tar and Resinous Substances; Decay of Gutta-Percha, 279.
GOOD HEALTH.—Sleep the Best Stimulant; How Long Should a Man Live; Carbolic Acid in Small Pox; Hemlock as a Poison; Remedy for Wounds; Remedies for Corns; Turpentine in Headache. 279.
MISCELLANEOUS.—Notes on the Reduction of Gold Ores; Topography of the Great Basin; The College Contract. 274. Economical Mining; Colorado's Mining Outlook; Canal and Narrow Gauge R. R. Combined; Pudrolithe—The Safety Blasting Powder; Wire Tramways in Austria; When Shall Manufacturers Pay Their Employees. 278. A Modern Manufacturing Village; Mineral Hill Silver Mines of Nevada; Shed-Hatching in 1872; International Exhibition in Philadelphia in 1876. 282. Patents and Inventions; New Incorporations; Mining Sales and Accidents, 284.

TO POSTMASTERS.—The interests of P. Ms. and newspaper publishers are, or should be, mutual. We assist the public in a kindred line. Out of 1,000 P. Ms. we know that 990 are friends of the PRESS. We do our best to make them so. They have a regard for respectable newspapers above that of ordinary merchandise such as is creditable to both heart and brains. But we regret to say there are a few exceptions among postmasters in this respect. There is one, in one of the large towns of the State of Nevada. At his office our papers are thrown into a heap, and subscribers, (if not others) are served with the paper that comes first no matter whose name is on it. We invite that P. M. to correct this. Failing to do so, we invite our subscribers to make a written statement, verified by one or more witnesses, and send to Mr. Barstow, Postal Agent, San Francisco and ask for redress.

THE VIENNA EXPOSITION.—It is said that American interest in the Vienna Eposition has been much quickened lately, and that a more generous and appropriate representation of our industries will be made than was at first supposed. The Austrian Government are anxious that the Americans should be well represented, and offer every facility and ample space. Prominent manufacturers should profit by this opportunity to exhibit their wares in a place where they will be seen by many. It is probable that as the time approaches for the Exposition to open, an increased interest will be felt and we will not be behind other nations in the extent, variety, or value of the other articles exhibited.

THE Calaveras *Chronicle* became "of age" on the 26th ult., the issue of that date completing the twenty-first year of its existence.

The Sutro Tunnel.

This tunnel, the largest one for the purpose in the world, was the idea of Adolph Sutro, from whom it derives its name. The feasibility and advantages of the project were first suggested by him in the year 1860, in an article which he wrote in one of the dailies of this city, showing clearly the advantages of working mines (especially those on the Comstock ledge in Nevada) by means of a tunnel or adit run low down on the hillside, and then sinking shafts to meet it, thereby insuring drainage and ventilation and convenient and cheap means of running out the ore through the tunnel, instead of the expensive method of sinking shafts, pumping the water from them, and then hoisting the ore by means of expensive machinery. But the principal advantages of the Sutro Tunnel are that its course is through a rich mineral country and that it is located so as to run at right angles to several distinct silver lodes and terminates at the famous Comstock, where it will follow that lode by adits run to the north and south at a depth of 2,000 feet. The tunnel and adits will, therefore, afford the best possible means of prospecting the mineral resources of the country and when ledges are struck they can be worked out with the greatest facility and all the ore brought to the mouth of the tunnel at a trifling expense, where it can be crushed and worked by mills and smelting works erected on the Carson River. This will save an enormous expense in transportation which is one of the greatest financial considerations in a mountainous country.

These few reasons will be evidence enough to mining men that the scheme will most probably be a lucrative one to its promoters as well as advantageous to the owners of mines in the vicinity. Our correspondent, Mr. L. P. McCarty, while he was at Virginia City recently, visited the tunnel and gleaned the facts connected with its history and development which we here present, to accompany the cute shown.

Difficulties in Starting the Work.

In 1864 the Nevada Legislature granted a franchise, giving Mr. Sutro and his associates the right of way for the tunnel, and in 1866 contracts were signed by several of the principal mining companies on the Comstock, granting to the tunnel company a royalty of $2 per ton on all ore extracted from the mines, either by the tunnel or otherwise as soon as the tunnel should reach the Comstock lode. In the same year a law of Congress was approved conforming to the rates in the contracts and granting in addition the right to all veins of ore discovered by means of the tunnel, and a grant of 1,280 acres of land at the mouth of the tunnel for a town site. But after all this was done it was not until Mr. Sutro had made several trips to the Eastern States and Europe that the necessary capital was obtained to start to work, which was in October, 1869. But owing to the limited means of the company, no machinery was made use of or any of the shafts started until December, 1871, when it may be said that the tunnel company fairly commenced operations.

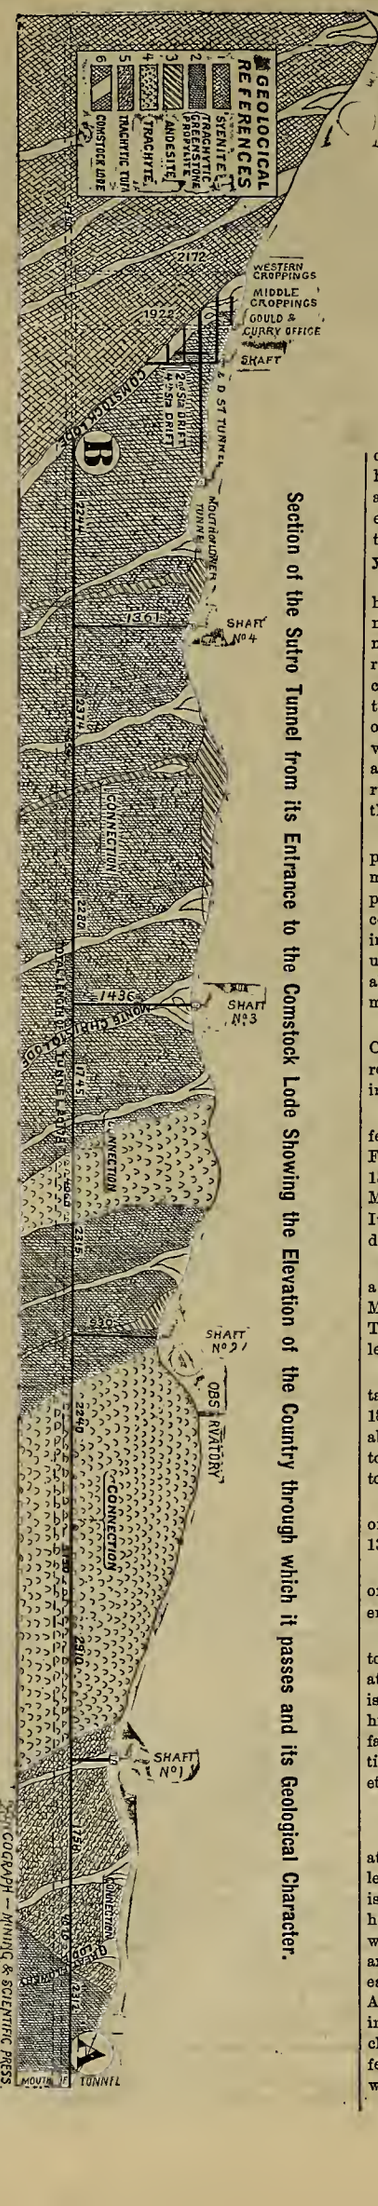
Mode of Construction.

The main tunnel will be about four miles long when it reaches the Comstock Lode. The *modus operandi* of constructing the tunnel is entering the side hill in the Carson Valley, and drifting in a westerly direction towards the Comstock lode at a depth of 2,000 feet below Virginia City, and sinking four shafts on the line of the tunnel at distance of about a mile apart. From these shafts the work of making the tunnel will be carried on in two directions as soon as they are down to the tunnel level. Therefore after each shaft is down, the whole work of making the tunnel will be carried on by making eight different tunnels to connect together, each one of these tunnels being little more than half a mile long, so that a tunnel over four miles long is made by making eight tunnels half a mile long each, and consequently the time required for making four miles of tunnel is absolutely reduced to the time required for running one half a mile long.

The Tunnel, Roads, Shafts, Etc.

The mouth of the tunnel is 4,100 feet above the level of the sea. It has a pitch or fall of two inches to the hundred feet, and there is a descent of 172 feet from the mouth of the tunnel to the river, a distance of 1¼ miles, which affords a fine opportunity for the erection of concentrating works, mills, etc. The tunnel runs north, 65° west, true meridian. Its total length to the Comstock lode will be 20,178 feet. The main tunnel, or header, is in 3,120 feet, and the enlargement, 680 feet, timbered complete. Shaft No. 1 will be 512 feet deep when completed; No. 2, 1,040 feet; No. 3, 1,450 feet; No. 4, 1,498 feet; No. 1 is down 400 feet; No. 2,600 feet; No. 3, 388 feet; and No. 4, 400 feet.

The main tunnel will be 12 by 16 feet, divided into two compartments, each five feet wide at the bottom, 4½ at the top and 7½ high in the clear. A double track narrow-gauge railroad will be laid from the mouth of the tunnel to the Comstock, of best American rolled rails and good convenient cars will be provided to run thereon. Beneath the track for the purpose of draining the mines and furnishing water power to run mills, etc., at the mouth of the tunnel a canal or water way is located. The header of the tunnel is five feet wide by six feet high. Both the header and enlargement are now being run by contract, and it is expected that the main work will be completed to the Comstock lode within two and one-half years.



Section of the Sutro Tunnel from its Entrance to the Comstock Lode Showing the Elevation of the Country through which it passes and its Geological Character.

An excellent wagon road six miles in length has been constructed over the line of the tunnel, connecting with all the shafts, though in many places the route lay over hills, and through ravines that seemed almost inaccessible. The cost of this road was about $60,000. A water tunnel is being constructed between the mouth of the tunnel and shaft No. 1, from which water will be taken to a large reservoir 300 feet above the level of the town, and pipes will be run from the same connecting with all parts of the town.

There are about 300 inhabitants now in the place; two large hotels, a livery stable and meat market are being erected, and several other improvements are under contemplation. The company has erected a large commodious dwelling house, the lower story of which will be used for offices. The cost of this structure was about $35,000, and it would be a credit to any metropolis.

The Progress Made

Can be seen by the following synopsis of a report made by Mr. Sutro, the General Superintendent :

December 30, 1871, the tunnel was in 2,663 feet ; January 26th, 1872, it was in 2,708 feet ; February 23d, 1872, it was in 2,751 feet; March 15th, 1872, it was in 2,792 feet; and at the time Mr. McCarty was there it was in 3,070 feet. It is completed and timbered its full size for a distance of 600 feet.

Shaft No. 1, January 28th, 1872, had attained a depth of 71 feet; February 25th, 105 feet; March 17th, 110 feet, and is now down 360 feet. The depth of this shaft, when at the tunnel level, will be about 500 feet.

Shaft No. 2, on January 28th, 1872, had attained a depth of 103 feet. February 25th, 185 feet; March 17th, 260 feet, and is now about 600 feet deep, which only leaves 400 feet to go before it will be at the tunnel level, ready to drift both ways.

Shaft No. 3, July 14th, had attained a depth of 45 ft.; Feb. 25th do 110 ft.; March 17th do 139 ft.; and in November do 370 ft.

Shaft No. 4, July 14th, had attained a depth of 68 ft.; Feb. 18th do 100 ft.; and at the present is down about 400 ft,

The latter is the deeper shaft and the nearest to Virginia City; it will strike the tunnel line at about 1,400 feet below the surface. There is a tunnel or adit being run through the side hill to strike this shaft 100 ft. below the surface for the purpose of drainage and ventilation while the shaft is in course of construction.

Machinery Used.

Up to the present time the work of hoisting at all the shafts has been carried on by Hoadley Portable Engines, but now new machinery is being put up at each place with suitable hoisting works. The requisite machinery and works when complete will cost about $500,000 and will consist in a large hoisting engine at each shaft, several large steam pumps of Allison & Brannan's make, such as are used in the mines in Pennsylvania, capable of discharging 800 gallons per minute in lifts of 250 feet each. Diamond drills and Burleigh drills will also be brought into requisition. Large

Miscellaneous.

A Model Manufacturing Village.

B. G. Northrup gives the following interesting particulars concerning the Fairbank's scale works, in a recent letter from St. Johnebury, Vt., to the *Christian Union:*

Here is a great manufactory of scales, by far the largest establishment of the kind in the world, employing about eix hundred men and nearly four hundred in branch departments elsewhere, and manufacturing over 50,000 scalee aunually. They are of all sorts end sizes—over three hundred varieties—from the most delicate etandard of the druggist or banker, to the ponderous hay, railroad car, or canal boat ecales, weighiug 500 tons at a time. They are adapted to the standards of all nations, and marked with the signs of each. This week a large invoice was sent to Japan, and for a long time they have been sold in China, Australia, India, Persia, Turkey, Arabia, (where they have been carried on mules' or camels' backs,) in the Barbary States, Cape Colony, Saudwich Islands, Iele of France, all the South American States, and still more largely in the great commercial natione of the earth. The yearly sales amount to about $2,000,000, and the demand is rapidly increasing. The business was never so prosperous as during the present season.

It has long been a marvel how such a concern could be made a permanent success for nearly fifty years in this remote corner of the State, so far from tide water, and with heavy and expensive freightage.

Now, what is the explanation of this marvelous prosperity? What is the condition of the workmen? These points I came here to investigate. For this purpose I inspected the works (covering ten acres), examined the processes, talked freely with the hands as well as with the owners and with the citizens of St. Johnsbury not connected with the factory. To observe the home life of the operatives, I entered their houses and conversed with their families.

This company maintains the highest reputation for integrity. Many names honored abroad are tarnished at home. Only the strictest honesty and fair dealing can stand the test of daily bnsiness intercourse with hundreds of hands for nearly half a century. "They do everything on the square" was, in substance, the answer of many citizens and workmeu to my inqniries on this point. The company has fairly earned and gained the confidence of their men and of this entire community, and a good name at home naturally follows them everywhere. The workmen say that they are never permited to do any sham work, even for the most distant market. To quote the pithy phrases of the men, "no shoddy here," "no veneering," "no puttying." The "test room" illustrates the thoroughness of their work. To avoid jar of machinery or movement of the air, all the scales are subjected to the nicest tests before being "sealed." The minutest films of metal are used for the more delicate trials. Masses of iron weighing hnndreds of pounds, are placed alternately on different corners of the railroad scale platform, and if the difference in position changes the "record," the scale is condemned. The thoronghness of the work and this severity of the test is the explanatiou of the world-wide reputation of the Fairbanks scales for accuracy.

There is a superior class of workmen in this establishment. All are males. Their work is proof of ekill. Their looks and conversation indicate intelligence. They are mostly Americans, and come from the surrounding towns. More than half of them are married, and settled here as permanent residents, intereeted in the schools and in all that relates to the prosperity of the place. Many of them own their honses, with spacious grounds for yard and garden, and often a barn for the poultry and cow. These houses are pleasing in their exterior, neatly furnished, and many of them are supplied with piano and tapestry carpets. The tenement houses, also, are inviting and comfortable, and surrounded with unusually large grounds. The town is mauaged on temperance principles, and drunkenness, disorder and strite among the hands are almost nuknown.

I examined the pay roll and fouud the wages very liberal. The workmen seem well satisfied on that score. Wherever it ie possible, the work ie paid for by the piece. The work itself is largely doue by machinery, and that *sui generis*, invented here and for the special aud peculiar results here reached. The meu are eucouraged to expedite their processes by new inventione, and they share largely in the benefite of all snch improvements. Paying by the piece has worked well here. This plan stimulates indnstry, promotes skill, and fosters inventivenese. It apportions rewards to the quality and quantity of work done; but more than all, this plan is recognized by the men as juet and satisfactory. With the time left practically to their own choice, there is no eight-hour movemeut here. No labor league or uuion hae ever existed—no etrike ever been euggested. This would be a poor place for the "iuternationals" to preach the gospel of idleness or agrarianism.

There has evideutly been mutual sympathy and interest between employer and employed. Governor Fairbanks, one of the fonndere, used to say to the men: "Yon should always come to me as to a father." He maintained relatione of kindness with them, visiting the sick, helping the needy, counseling the erring, encouraging their thrift, enjoining habite of econoiny. He taught them that it wae their interest and duty to "lay up" something every month, and that the best way to rise in the eocial scale wae to unite economy with increasing wagee. The fact that so many of his workmen are "forehanded," besides owning their homesteads, is due to his teaching and example. The worth and dignity of work, he illuetrated in theory and practice. The notion that labor was menial, or that the tools of trade or farm were badges of servility, he deepised. His sons worked in the shops and thoroughly learned the trade. The brothers of the Governor were in full eympathy with him, and the same spirit characterizes the eons and surviving brother who now manage the concern. There is still the fulleet and happiest conciliation between labor and capital. It is not strange that workmen "hold on." Their permanency is a striking fact. Many have been here from twenty to forty years. I conversed with one man over seventy years of age—a foreman—who has worked here "from the start," forty-three years.

Years ago the men were aided in forming and sustaining a lyceum, and liberal prizes were offered for the best essaye read. Recently, Horace Fairbank has founded a library and opened a large reading room, free to all. The Athenæum containing the library, reading room and also a epacious lecture hall, is an elegant structure, 94x45 feet two stories high. The books, now numbering 8,300, are choice and costly. Having visted nearly every town of Massachusetts and Connecticut, and traveled widely in this conutry, I have nowhere found in a village of thie size an Athenæum so costly, a reading room so inviting, and a library so choice and excellent as this. These various provisions for the improvement, happiness and prosperity of this people, coupled with liberality and fairness in daily intercourse, explain the absence of discontent and the uniform sympathy, good feeling and harmony which prevail. I have nowhere seeu a better practical solution of the labor question.

Mineral Hill Silver Mines of Nevada.

A late number of the London *Mining World*, contains an interesting report upon the history and condition of an Englieh company owuing extensive mines at Mineral Hill, Nevada. Former great productiveness having been most unexpectedly cnt off, after the property had been sold through the old and eminent firm of Messrs. John Taylor & Sons, London, and a general panic having arisen amongst the *debenture-holders*, who had been induced to invest upon authentic reports made by this firm—1st, That the gross yield of silver ore from the mines had for three months averaged $75,000 per month, and that all expenses incident thereto had not exceeded 30 per cent.; 2d, That there was ore "in sight" to the value of $1,000,000 at the least, a committee of inquiry was appointed to make thorough examination as to the "honest, conscientious and bona fide character of these statements which accompanied the prospectue of the company. As these mines are in a etratification similar to that of many mines in Utah, and English companies operatiug there may sometimes encounter fluctuatione like those of the Mineral Hill Company, the following eynopsis will be read with interest:

The history of the enterprise is plainly set forth. Four Nevada men were owners of the mines. They eold the property to a mining company of California, of which Messrs. Ralston and Lent appear as promoters. From this company the mines and a mill, together with profits from February 20, 1871, were purchased for £245,000 by an English company called the "California Mining Company, (limited)." Subsequently this California company limited sold all the property, (comprising about thirty-uine mines, mill, mill-eite and wood ranchee) to another English company—"The Mineral Hill Silver Mines Company (limited)"—for £255,000 in cash, and £240,000 in shares full paid in said company.

The public were not invited to take any shares of the capital stock. This large amount of money was raised by sale of "debenture-bonds," being of the nature of First Mortgage Bonds npon the property of the company. All the ehares appear to have beeu retained by the California company, aud by the gentlemen who negotiated the sale, or who guaranteed the purchase money, if the public did not fully take the debentures.

Mr. John Taylor, Jr., of the distinguished firm referred to, came out to Nevada, personally examiued the mines and reported favorably upon their richuess and "ore in sight." The details of ore reduced by a fifteen-stamp mill, during thirty-five days running time, was shown to be 814¾ tons, yielding at 92 per cent. of assay value, $152,141 88. Debenture bonds were readily taken hy the English public, and in a short time no less than £230,000 sterling, on account of purchase money, was remitted to Mr. Raleton of the Bank of California.

In thie large amonnt of value, little or no working capital or reserve fnnd appeare to have been provided against "a rainy day." Mines eo rich as these were expected to run themselves. When intelligence of the sudden failure of productivenese in the miues reached England, a demand arose amongst the debenture-holdere for the rigid examination referred to, and a petition was circulated for winding up the concern. Mr. Taylor, Jr., visited Nevada, and a full expose of the transactions for sale of the mines and debentures was made.

In their report the committee etate:

"The appearance of the mines wae ench as to induce him (Mr. Taylor, Jr) to become a director of the company, and to iuvest £500 in the debenture bouds when issued, which bonds he still holds. He explained the way in which he made his calculations of the quantity and value of the ore stated by him to be opened to view, and which calculations were those ordinarily used hy mining engineers; he further ehowed that it was owing to the ore ground being most unexpectedly cut off at various points hy beds of unproductive limestone, that his calculations had proved erroneous."

Mr. John Taylor, een., explained his connection with the organization of the company, etating that "euch reliance did he place in his eon'e judgment, and in the accuracy of his report, that he had not the eightest hesitation, when requested to do eo, in becoming a director of the company. He well knew, in doing eo, that many of his old, intimate, and valued connections would make investments in au undertaking that bore hie name, and no better proof can be addnced of the *bona fides* of his opinion of the sonndness of the adventure, than the fact of his having taken, and still holding for himself and his children, £1,600 worth of the debenture bonds, in addition to the £500 taken by his son."

In reply to questions pnt to him by members of the committee, he said "he had in the course of his experience known mines qnite as rich in appearance as the Mineral Hill mines, become much poorer in appearance and much more unprofitable, and then again become largely productive, and ultimately richer than they ever had been. He would uot take upon himself to say whether the use of the diamond drill was the best mode to adopt, but it would certainly show the different characters of the beds of limestone passed through, and how its various changes, if any, would be favorable or otherwise to mineral bearing."

The company strongly recommend that further explorations of the company's property be carried on, advising the directors "to engage the services of Mr. Henry Sewell, (who is now in Utah) a gentleman of great experience in Mexican and Chilian miuing, (in both of which countries, yonr committee are informed, the stratification of silver mines is similar to that of Nevada), to make an inspection of the mines and to recommend where, in his judgment, explorations should be made."

"While yonr committee, in common with their fellow sufferers, deplore the present collapse of the mines, they deem it but common fairuess to state as their unanimous opinion, that they have been nnable to discover an act of any individual deserving of ceusure on any grounds of fraud or misrepresentation."

After suggesting a manner for raising funds to prosecute the work the report concludes,

"Your committee earnestly solicit the aid and co-operation of the debenture-holdere, nrging them not to be disheartened becanse the speculation in which they have made an advance has become nnproductive. Such are the fluctuations of miniug, that the property of which the debenture holders are the mortgagee may, eventnally, prove to be as valuable ae they anticipated, instead of retaining its present impoverished aspect."

Shad-Hatching in 1872.

So far as we know, the only rivers in which shad are hatched are the Connecticut, the Hndson, and the Merrimac, and this is the sixth season of the use of Seth Green's hatching-boxes—a discovery that is likely to do for the food supply of the nation what Whitney's cotton-gin did for its clothing. About 8,000,000, of shad-spawn were hatched in the Hudson last year, and we learn, nnofficially, that the number is considerably exceeded this year. Of the number hatched, 220,000 were put into the river above the Troy dam, 80,000 into Lake Champlain, 20,000 in Lake Owasco, 50,000 in the Genesee River, 30,000 in the Alleghany River at Salamanca, and 25,000 in the Miseiesippi River, two miles below St. Paul. The remainder were turned into the river below Castleton. The operations began May 18th ended Jnly 2d.

The ova hatched in the Conuecticut last year were over sixty millions. This year operations did not begin until the 24th of June, and ended on the 18th of July—less than four weeks. The fish were larger and finer than ever before, and the hatch of spawn was ninety-two million sixty-five thonsand, a third more than was taken last year. The hot weather of the early part of July had snch an effect npon the females, that the average number of ova from each one was greatly increased. Of this number 2,000,000 were sent to the Alleghany, White, and Platte Rivers, a half-million were distributed in Rhode Island waters, a half-million were sent to the Sangatuck, and about the same nnmber to Great Brook, in Groton, Ct. All the rest were turned into the Conuecticnt, jnst below Hadley Falls. This enormous addition to the finny tribes was made at an expense to the State of Connecticnt of about five hundred dollars. If the improvement of only two of our shad streams for five years has resulted in the reduction of the wholesale price of shad in New York to $3.50 per hnndred, what may be expected when all the States turn their attentiou to this business, and Seth Green'e hatching boxes are in use npon every shad stream in the country? Is not cheap food for the coming millione a problem already solved?—*Am. Agriculturist.*

International Exhibition in Philadelphia in 1876.

The following has been placed in our hands for publication:

Office U. S. Centennial Commission.
Philadelphia, Pa., Oct., 1872.

I. N. Hoag, Secretary State Agricultural Society, Sacramento, Cal.: The Anniversary of the Independence of the United States in the year 1876, is to be celebrated by an exhibition of the products, arts and industriee of the country, and of the world. This ie in accordance with an act of Congrese approved March 3d, 1871. By this act the taek of preparing and superintending the exhibition was imposed upon the United States Centennial Commission, coneisting of two members from each of the States and Territories. The Commiesioners have twice met in general session, a permanent organization has been effected, and the chief outlinee of the plan for the exhibition have been agreed upon.

This exhibition ie to be international and nniversal—interuational inasmuch as all nations will be invited to participate in it; and universal, because it will include a representation of all natural and artificial products, all arts, industries and manufactures, and all the varie results of human skill, thonght and imaginaation.

The outlines of a simple yet comprehensive claesification have been adopted. There will be ten departments, each subdivided in ten groups, and these agsin into classes. The details of this classification are now being elaborated and will be published in due season, together with such rules and regulations as may be fouud necessary for the proper conduct and management of the exhibition.

It is intended that ample space shall be assigned to each State, Territory and foreign country for a just and proper display of their products. It is believed that not less than fifty square acres of floor space under roof, will be required for this purpose. A site combining the advantsges of a sufficient extent of level ground, with picturesque and cultivated surroundings, easy of access by rail, water and by ordinary roads, has been assigned for the buildings and grounds at Fairmount Park in the city of Philadelphia. The exhibition will open in April and close in October.

Each State of the Union will be expected to send its peculiar producte, illustrating its resources, both developed and undeveloped. A complete exhibition of this kind by all the States will afford the meaus of comparing their iudustrial condition and capabilities. The producte of mining and agriculture will occupy a large portion of the space allotted to each State, and will receive their just ehare of attention in this universal display.

An undertaking so patriotic in its conception, so vaet in its proportions and so useful in its results, commende itself to the hearty sympathy and support of intelligent people. Patriotism, as well as an appreciation of the industrial-educational and moral influences of well organized exhibitions, should impel all citizens to lend a helping hand. It is the duty of the Commission to prepare the way and open the doors, but the people, in their sovereign right and strength, must make the exhibition. By their aid alone can it be made a just and comprehensive display of the industrial, intellectual and moral development of the nation during the first century of its existence.

The Commission not only relies with confidence upon the aid of the people in general, but it hopes to receive the co-operation of the many State societies and organizations which for eo many years have aided in directing and realizing the popular demand for agricultural and industrial exhibitions. The desire to secure at an early date your efficient co-operation has led to this communication, which is made at the request of the Executive Committee of the Commission.

Permit me to suggest that the facts herein stated might with great advantage to the exhibition be communicated as publicly as possible to your members and exhibitore, and that, if agreeable, they should be incorporated in your printed reports. A committee of your members might be appointed to consider and snggest such meaenres as may appear most desirable to promote the success of the object for which the Centennial Commission is appointed. A general plan for the organization of Co-operative Centennial Associations in the several States and Territories is now under consideration, and when perfected will be published for distribution.

Please acknowledge the reception of this communication. Very respectfully, your obedient servant,

Wm. Phipps Blake,
Executive Commiesioner.

Mining affairs in Clear Creek county are growing into greater importance every week. Reliable information of new and rich discoveries greets our ears almost daily. We are inclined to the belief that prospecting has not reached even the margin of the rich silver deposits of thie remarkable region. The large deposits of remarkable rich ore lately etruck in many of our mines, are almost bewildering. The ore blockade is increasing in such proportions, that the market ie glutted and the mille overstocked with more ore than they can treat. There is a wide and profitable field for capital to invest in the building of silver mille in thia county, at the present time. Who will come to the rescne of our mining industry, and reap a rich harvest of profits?—*Colorado Union.*

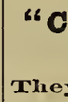
AVERILL'S
CHEMICAL PAINT,
Of any desired Shade or Color,
Mixed ready for application, and sold by the gallon.
It is Cheaper Handsomer, more Durable and Elastic than the best of any other Paint.
Office, corner Fourth and Townsend streets, San Francisco. Send for sample card and price list.
15v23-3m HELY & JEWELL, Agents.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Opsrates as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco

S. W. HOWLAND & CO.,
Crushers and Samplers of Ores,
No. 16 DRUMM STREET,
BETWEEN CALIFORNIA AND SACRAMENTO STREETS.
S. W. HOWLAND, the Pioneer Crusher and SAMPLER of Ores and Pulverizor of Mineral and Chemical substances, has returned to San Francisco and resumed business at the above, his original stand. He wishes it to be DISTINCTLY UNDERSTOOD that having several months ago dissolved partnership with Mr. Thurman at the Mission Street Mill, he has now NO CONNECTION WITH THAT ESTABLISHMENT whatever.
The Same Faithful Sampling
Formerly performed by him may be relied on, and such is guaranteed, oc1915p3m

Important to Miners and Mill Men.
Silver-Plated Copper Amalgamating Plates, for saving Gold.


Of all sizes and in any quantity, furnished to order. Full instructions sent for operating. Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.
SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Mission street, San Francisco.

18v24-6m SAN FRANCISCO.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st., between Fremont and Beale, San Francisco

[Continued from page 280.]

Root blowers will be used for supplying air to the mine at each shaft.

At the Mouth of the Tunnel

Things present a lively appearance and great improvements are being made. The priucipal buildings of the company here are the office building, the machine shop and the carpenter shop. The Company's office huilding is second to none in this State, and will cost about $50,000 when completed. It is located in a splendid position, commanding a view of the whole Carson Valley and town of Sutro. The machine shop and carpenter shop is over 200 ft. long and 36 ft. wide. The machinery is run hy a fine 50 horse-power engine and the machine shop is furnished at present with 10 lathes, 1 planer, 1 drill press, 1 holt cutter.

Shops and Houses.

Iu the blacksmith shop there are 3 forges in constant operation. Connected with the machine shop is a tin and coppersmith shop fitted out with all the requisite tools for doing all kinds of work.

In the carpenter's shop there is a circular saw, a jig saw and a large wood lathe. More machinery for the machine shop is expected from the East.

A large store house is to be built at the mouth of the tunnel where the necessary supplies for the whole line will he kept on hand, and from it all the material will be forwarded to the different shafts as required.

At the present time there is nearly $40,000 worth of material on hand for the store house at Sutro. A railroad is to be built from the mouth of the tunnel to the Carson River for the purpose of hauling wood to the tunnel. The wood is floated down the river and corded on its banks ready for transportation.

The Town

Is splendidly located on a gentle grade toward the Carson River. The streets are laid out at right angles to one another and are wider than any streets in the United States.

Boarding houses, stores and livery stables are going up and lots are selling at $500 each, and corner lots are held at $1,000, and when a ledge is struck in the tunnel the lots will double in value immediately.

There are over 200 men employed in the precinct of Sutro, and there is every inducement for people to start in business in the new town, which is destined to be one of the largest in Nevada at no distant period, as it is certain now that the tunnel will go through. Consequeutly there will he mills and smelting works and manufactories of all descriptions located at its mouth, making the town a large business center.

The Shafts on the Tunnel Line.

About half a mile from the mouth of the tunnel is the air shaft, which is used for supplying air to the miners in the header, for which purpose there is a hoisting engine that, in addition to hoisting the rock, runs a No. 2 Root hlower.

Shaft No. 1 is about one mile from the mouth of the tunnel. Here there is in course of construction a new hoistiug works and a new Risdon hoisting engine, 14x27 cylinder, heing put up to take the place of the old one. There are two common steam pumps in the shaft and a Hoadley portable engine on top. There are two 54 boilers and one 48 boiler, making in all ahout 150 horse-power.

At shaft No. 2 new hoisting works are going up, and there is a new Booth hoisting engine, 16x27. There will he five large hoilera at this shaft, and several steam pumps will he used in the shaft.

At shaft No. 3 there is a similar building and a Booth engine 18x27, with three cylindrical boilers, and one 100 horse-power Babcock & Wilcox sectional hoilers, and several steam pumps.

At shaft No. 4 the hoisting worka are also being built, and a new Risdon hoisting engine, 20x27 cylinder, in running order. In addition to thia machinery there is a portahle engine, three ateam pumps, three cylindrical hoilera, and one 100 horse-power Root sectional boiler.

Two diamond drilla are now in operation at the mouth of the tunnel, and others will he supplied to the ahaft as fast as they arrive from the East. The Allison & Brannan steam pump and Burleigh drilla will also be used at the different shafts. The steam pumps will be the largeat in use on this side of the Rocky Mouutains; their steam cylinders will he 72x30, and they will discharge 700 to 800 gallons per minute to a vertical hight of 250 feet.

The Officers, Engineers and Foremen,

Are uumerous, as will he seen hy the following; but a large and important company like this, with a capital stock of $12,000,000, divided iuto 1,200,000 shares of $10 each, must necessarily be efficiently and numerously officered. Joseph Aron is President; C. W. Brush, Vice President; P. W. Ames, Secretary; Adolph Sutro, General Superintendent (general office, No. 321 California street, in this city); John Anderson in charge of steam engineering department; G. Haist, Civil Engineer; G. A. Taylor, Master Carpenter; Foreman of Machine Shop at Tunnel Mouth, John Pritchard; Foreman at Mouth of Tunnel, Thomas Ford; Foreman of Shaft No. 1, John Brew; Foreman at Shaft No. 2, John Blewett; Foreman at Shaft No. 3, Wm. Trevathan; Foreman at Shaft No. 4, Joseph Harvey; Chief Engineer at Shaft No. 1, N. Myers; Chief Engineer at Shaft No. 2, T. Street; Chief Eugineer at Shaft No. 3, John Kinney; Chief Engineer at Shaft No. 4, A. J. Keegan.

From the description we have given, and the cuts accompanying this, with that which appeared in our issue of Octoher 19th, the importance of this tunnel will he evident even to the eye of those unacquainted with mining operations. It has attracted the attention of engineers and scientific men all over the world, and its ultimate completion is looked for with auxiety. We would say much more on this important undertaking, hut want of space forhids, and what is given above, in connection with the accompanying cuts, will itself show the magnitude, progress and ultimate benefits of the Sutro Tunnel.

Mechanics' Arts College — Polytechnic Lectures.

It is proposed that under the regulations applying to "Students at Large," or the "Fifth Class," tutorships be authorized under the auspices of the University, in connection with the Mechanic'e Arts College or "Polytechnic Department of the State University"—on euch specialties, scientific and practical, as (*a*) are worthy of heing fostered; (*b*) in which at the same time puhlic instruction is demanded; and (c) in which specialists exist in our midst who have huilt up more or less reputation of a suhstantial character.

That from two to six, or even ten lectures on such suhjects, to he delivered to such classes as the names of such lectnrers or specialists may have the influence to draw, he advertised by and under the auspices of the University. The University can afford, perhaps, to furnish the class lecture rooms and lights, and some of the necessary apparatus and epecimens of duplicates. The lecturer to be paid for his lahors hy some system of moderate fees, such as is provided for under the regulations of the 5th class, (and as may induce students at large to "suhscrihe" for three to eight courses or topics, at so much per topic, amounting in the aggregate to considerable). Considerations of reputation, or of interest in their own specialty, on the part of the lecturers, will secure, on the ahove moderate terms, some of the best qualified men in this State.

In this manner it is believed that tutorships or lectureships conld he successfully and very creditably established, on most of the following branches of knowledge, calculated to enlarge the individual's capacities:

Sciences.

A. In the Organic World.

I. Geology. — 1. Geological Formations of the State and Coast; 2. Geological Reconaissance; Methods of making accurately rough surveys and of Recording Observations on Prospecting Trips and the like, through regiona unexplored or undeveloped as to reaources; to be put in the form of maps and reports, by means of which the commnnity at large may benefit hy such special knowledge, and the region as well; 3. Coals and Coal Formationa of the Coast; 4. Gold, Distribution, Ores, Deposits and Mining; 5. Silver; 6. Fossils; Determination of; Localities of.

II. Mineralogy.—1. Determination of Minerala and Ores hy rongh methoda available in the field or while traveling: Hardnesa, Streak, Crystallization and Special Character, etc., with Drawera of Minerals; 2. Testing and Analysis of Mineral Suhstancea with the Blowpipe, qualitative and quantitative; 3. Assaying; 4. Earths (useful), Soils and their adaptations, with specimens.

III. Chemistry.—1. The simple arts of Qualitative Chemistry,

B. In the Vegetable World.

I. Botany. — Determination of Treea and Grasses, etc.; Distribution of Foreata, Woods, economical.

II. — Agriculture. — 1. See Earths, under Mineralogy; 2. Grasses for Grazing, Distribution of (See B. 1.); 3. Horticulture, or Tree Planting and its Profits; 4. Irrigation (under Civil Engineering); 5. Agricultural Engiueering—Steam Cultivation, etc.; 6. Insect Foes of Agriculture.

C. In the Animal World.

1. Zoology.—1. Determination of Classes and Species; Stuffing, etc.

II. Economically Considered.—1. Game and Fish; Geography, Resorts, Numhers, Habits; 2. Domestic Animals, etc., and Products.

D. Physical Geography, ("Earth and Man;") 1. Relief of Continent, Scenic, Recent and Surface Geology; 2. Meteorology, Climates, Rains, etc.; 3. See Reconnaissance and Mapping under Geology and Civil Engineering.

E. Microscopy.

The Professions:

I. Engineering, Civil.—1. Railroad Surveying and Building, railroads in general; 2. Reclamation; 3. Irigation; 4. Topographical Representation and Mapping.

II. Engineering, Mining.—1. See under Minerology and Mapping, under Geology and Civil Eugineering; 2. Methods Practiced in Placer and Hydraulic Mining; 3. Milling of Ores by Amalgamation in Pans, etc; 4. Smeltiug of Ores; 5. Roasting of Ores; 6. Stamp Mills and Concentration, their cost and Adaptation; 7. On Examining and Reporting upon Mines and Properties. See Re-Reconnoissance 8. See Geology of Gold, Silver and Coal, under Geology.

III. Learned Professions.—1. Law; (Justice) 2. Medicine and Hygiene, [Man]; 3. Theology, (God.)

IV. Literature and Literary Arts.—1. Newspaper and Book Making; 2. Shorthand.

The Arts:

I. Liberal Arts.—1. Drawing and Painting, 2. Photography; 3. Music.

II. Mechanic Arts.—1. The Trades: how to proceed to learn each; Studies and Facilities for; 2. Manufacturing Industries.

Society and the General Public Welfare.

I. Commerce.—1. Stocks and Financial Arts, and Figuring; 2. Bueiness and Executiveness, Methods of.

II. Politics and Public Affairs.—Government (or "Ring" Science?): Influence to Control, etc; 2. Public Works.

III. Political Economy.

New Incorporations.

Occident G. and S. M. Co.—Oct. 24. Location: Kern District, White Pine county, Nevada. Capital, $800,000 in 30,000 shares. Trustees—H. Allen Mayhew, John J. Marks, Geo. W. Stewart, Cbas. H. Brickwedel and Freeman Trask.

Table Bluff G. M. Co.—Oct. 25. Location: Humboldt county, State of California. Capital, $500,000. Trustees—Charles E. Hascltine, J. Jewett and William J. Woodley.

Rye Patch M. and M. Co.—Oct. 25. Location: Humboldt county, State of Nevada. Capital, $2,000,000. Trustees:—J. D. Fry, Geo. D. Roberts, John F. Boyd, John W. Gashwiler and A. N. Towne.

Tyler G. M. Co.—Oct. 26. Location: El Dorado county, Cal. Capital, $100,000, in 1 000 shares. Trustees—Tyler Curtis, Tbomas Nelson, Robert Ewing, Frank Mahan, William Corcoran, John Parnell and Edward Menan.

Marks & Darrow M. Co. — Location: Tuolumne county. Capital stock, $3,000,000. Trustees—Bernhard Marks, George A. Darrow, George H. Darrow, Wm. Darrow, Seigas Solomons, Frederick MacCrellish, W. L. Ustick, A. Noel and Daniel McLeod.

Heath Manufacturing Co.—Oct. 30. Objects: To buy and sell patents or interests therein; to maoufacture and dispose of patented articles; to deal in lahor-saving machinery; to buy, lease, improve and hold any kind of estate; to originate, improve, invent, caveat patents and dispose of whatever may be discovered by the Company; to borrow and loan money and all that may he lawful to make it a successful manufacturing company. Capital stock, $100,000, in shsres of $100 each. Trustees—Elander Heath, Henry F. Williams and A. M. Winn.

Yellow Pine Copper and Galena M. Co.—Oct. 30. Location: Yellow Pine District, Lincoln county, Nevada. Capital stock, $5,000,000, in 50,000 shares. Trustees—O. H. Frank, Thomas B. Moore, Joseph F. Atwell, John W. Bucklin and W. O. Wilcox.

A Revolution in Gas.—The new portable safety gas light is the neatest thing we have seen, and is calculated to cause an entire revolution in the present system of lighting for domestic purposes. It generates its own gas which is consumed as soon as generated, thus rendering explosions impossihle. It is certainly a desideratum long called for, and will he gladly welcomed hy those who have lived in daily and hourly dread of injury from explosion of the various dangeroua inflammahle oils now in use.

Mining Sale.—We learn from the Calaveras *Chronicle* that the well-known Gwin mine, in Lower Rich Gulch, in that county, has heen sold to English capitalists for the round sum of $1,000,000. The *Chronicle* citea thia aa an example of what well directed energy and peraeverance hae wrought, and thinka the great development and anccessful working of the Gwin mine muat certainly exert a wholesome influence on the quartz interesta of the county by atimulating and encouraging operations in the future.

Mining Accidents.—Thomas Drumm, a miner in the Kentuck mine, Washoe, was killed on the 22d ult. hy falling down the shaft.

Thomas Hill was caved upon by a hank and killed in the Fox and Elliott claim on Brown's Flat, Tonlumne county, on the 19th ult.

Robert Hutt was killed on the Yolo mine, Ely District, on the 21st hy following down the shaft.

Willam Rogers was so badly hurt in the Empire mine, Grass Valley, on the 24th ult. hy a rock falling upon him, that he is not expected to recover.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For Week Ending October 1st, 1872.*

Steam-Condenser.—Washington R. Pitts and George K. Gluyas, S. F., Cal.

Friction-Clutch.—Timothy Stebins, S. F., Cal.

Rotary Pump.—Samuel A. West, S. F., Cal., and Louis Goodwin, Virginia City, Nevada.

Car-Coupling.—James Pearson, Sacramento, Cal.

Tuyere-Tester.—Robert A. Fisher, Eureka, Cal.

Slag-Spout for Smelting-Furnaces.—Rohert A. Fisher, Eureka, Nev.

Slag-Pot for Use in Smelting-Furnaces.—Robert A. Fisher, Eureka, Nevada.

Roasting Ores.—Guido Kustel, S. F., Cal., and Friend W. Smith, Ellsworth, Nevada.

Journal-Box. — Jonathan S. McClure, Gold Hill, Nev.

Billiard-Cushion. — John George Hermanu Meyer, S. F., Cal.

Apparatus for the Manufacture of Cube Sugar.—August F. W. Partz, Oaklaud, Cal.

Manufacture of Cube Sugar.—August F. W. Partz, Oakland, Cal.

Manufacture of Harn Sugar.—August F. W. Partz, Oakland, Cal.

Invalid Benstead.—Benjamin Pollard, Dutch Flat, Cal.

Cultivator.—Andrew T. Sherwood, Amador, Cal.

Apparatus for Enameling Photographic Pictures.—Nathaniel Weston, S. F., Cal., Patent No. 72, 138, dated December 10, 1867.

———*The patents are not ready for delivery hy tbs Patent Office until some days afterward.

Note.—Copies of U. S. and Foreign Patents furnisbed by Dewey & Co., in the sbortest time possible (by telegraph or otherwise) at the lowest rates. All patent husiness for Pacific coast inventors transacted witb greater security and in mucb less time than by any other agency.

Office of the Chicago Silver Smelting and Refining Company.

Chicago, July 16, 1872.

L. P. Dodge, Esq.—Dear Sir:—Yours of 13th inst. at hand and contents noted. The 24-inch Whelpley & Storer Pulverizer, you set up at our Works, is running to our entire satisfactlon, and realizes fully all you claimed for it. We are pulverizing Colorado Ores, reducing them to a powder, at the rate of about 2,000 lbs. per hour, requiring about 12 horse power. Machine is simple, easily operated and hut very slight expense for wearing parts. We cordially commend them to parties interested in mining machinery.

J. E. M'Neill, Secretary.
J. W. Bell, Superintendent.

N. B.—See illustrated adv. in another column.

Continental Life Insurance Co., No. 302 Montgomery street, corner of Pine.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company—Location

of works, Grass Valley, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of October, 1872, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, at No. 23 Merchants' Exchange, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 26 day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 25th day of November, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office—23 Merchants' Exchange, San Francisco, Cal.

oct5-3t

Amazon Silver Mining Company—Location

of works, Ely District, Lincoln County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the Twenty-second day of October, 1872, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary pro tem., at his office, No. 609 Sacramento street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the second day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the Twenty-third day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. J. McMANUS, Secretary *pro tem.*

Office, 609 Sacramento street, San Francisco, Cal. no2

Excelsior Silver Mining Company—Location

of works, Yellow Pine District, Lincoln County, Nevada.

At a meeting of the Trustees of the above named company, held October 28th, 1872, at the office, No. 640 Washington street, San Francisco, it was, on motion, ordered that the following resolution, which was unanimously passed at a meeting of the Stockholders, held October 25th, 1872, be advertised for one month in the Mining and Scientific Press, and a personal notice served on each member:

Resolved—That we, the Stockholders representing in our individual names 4,480 shares of the Excelsior Silver Mining Company, do hereby mutually agree to return our individual certificate or certificates of stock now held by us and standing in our names, agreeing that upon a pro rata division of the entire stock between the stockholder, that we will individually pay a monthly assessment of ten dollars ($10) per month for one year, unless sooner rescinded by the Trustees of said mine.

Also, that said monthly assessment shall be paid on or before the tenth day of each month, commencing November 10th, 1872. By order of Trustees.

no2-1m W. A. KOLLMYER, Secretary.

Indus Gold and Silver Mining Company—

Location of works, Virginia City, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1872, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at No. 24 Merchants' Exchange, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 25th day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, 24 Merchants' Exchange, California street, San Francisco, Cal oc26-4t

Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of October, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 220 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 21st day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. H. CORNELL, Secretary.

Office—No. 220 Clay street, San Francisco, Cal. oct9-4t

Louise Mining Company---Location of

Works, Ely Mining District, Pioche, Lincoln County, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the 21st day of September, 1872, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the company, on Monday, the 25th day of November, 1872, at the hour of two o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Secretary.

Office, 418 California street, San Francisco. no2-3t

State of Maine Mill and Mining Company

—Location of mine, Amador County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 17th day of October, 1872, an assessment of five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 305 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 26th day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public anction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

oc26-4t H. B. CONGDON, Secretary.

Office, No. 305 Montgomery street, San Francisco, Cal.

Caution---Victoria and Imperial Tunnel

and Mining Company—Location of works, Little Cottonwood, Utah Territory.

Notice is hereby given that the following named shares, designated by the number of their respective Certificates, in the capital stock of the Victoria and Imperial Tunnel and Mining Company, were duly advertised, and sold at public anction by John Middleton & Son, Auctioneers, on Saturday, the 12th day of October, 1872, for delinquent assessments and accruing costs of advertising and sale, and will not be transferred by said company.

The First Annual Meeting of the Stock-

holders of the Ruby Hill Mill and Mining Company, location of works, White Pine County, State of Nevada, for the election of Trustees for the ensuing year, and the transaction of such other business as may come before such meeting, will be held at the office of the Company, No. 304 California street, on Thursday, October 31st, 1872, at 3 o'clock, P. M. P. W. VAN WINKLE, Secretary.

San Francisco, Oct. 23, 1872.

If You Write and Mail a Letter as Follows:

Messrs. HOWARD & CO., No. 865 Broadway, N. Y.:

Please send me your Price-List of Waltham Watches for 1872, as per advertisement in Mining and Scientific Press.

(Sign Name and Address in full.)

You will receive, postpaid, by return mail, a very interesting pamphlet, illustrated with fine engravings, describing the details of the Waltham Factory, and telling how the Watches are made. You will also receive our Price-List, which describes all the different grades of watches, gives weight and quality of the cases, with prices of each, and also explains our plan of sending Single Watches by Express to any part of the country, no matter how remote, with the privilege of examination before paying the bill. Two new Watches have been added to the list, the "Boy's Watch" and the "Railroad Time-Keeper." Please keep in mind that we will refund the money for any Watch that is not satisfactory. Address HOWARD & CO., No. 865 Broadway, New York.

Residents of California, Oregon, and other distant place will find a great advantage in dealing with us.

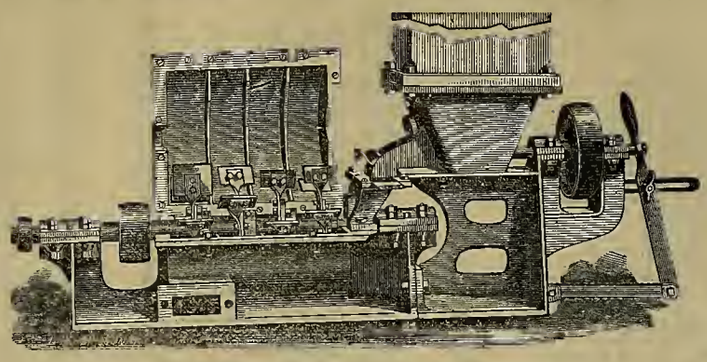
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operations. Respectfully J. W. JONES, Superintendent, etc.

May be seen in practical operation on Main street, between Howard and Folsom, San Francisco.

This Machinery has been adopted hy nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

9v25-3m GEO. D. WYMAN, Agent Pacific Coast.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

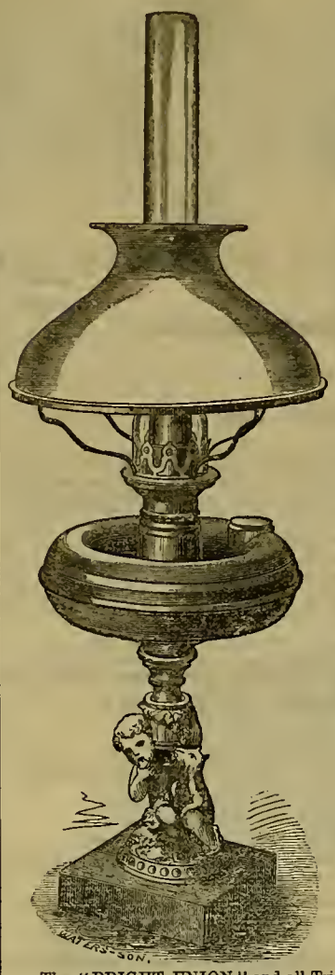
BRIGHT UNION SAFETY LAMP.

A CALIFORNIA INVENTION.

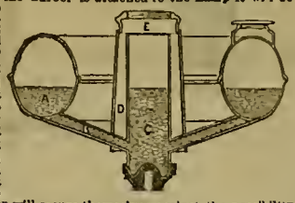


Patented May 30, 1871. Is the Best and Safest Lamp ever put in the market, for the following reasons:

1st.—The Lamp is constructed with two tubes, as will be seen in cut, the outside one (D) intended only for the attachment of the burner, and the inside one (C) to contain oil and receive the wick. As there is no connection between these tubes, it will be evident that there is no possibility of communicating any heat to the oil; and as long as the oil in a Lamp can be kept perfectly cool, there is, of course, no chance for an explosion.

This Lamp is the only one ever invented in which this result has been secured.

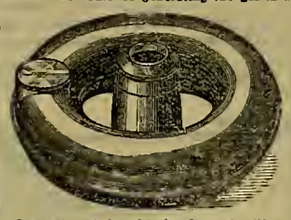
2d.—When the burner is attached to the Lamp it will be seen that there is no opportunity for the oil to escape should the Lamp be overturned, and in case any accident should occur the worst consequences that could ensue would be the breaking of a chimney or shade. From these facts it will be evident that those who adopt this Lamp will secure themselves against the possibility of fire or explosion arising from the use of kerosene oil.



3d.—The Lamp is strongly and well made, attractive in appearance, and something entirely new and novel. It will burn kerosene adopted to any burner. With all of these advantages it combines cheapness, and from present indications it is destined to become very popular.

4th.—The tube to which the burner is attached (D) is free from the tube of the oil (C), and a space for air, passing from the lower end, between the tube of the burner and the tube of the oil, keeps it always cool.

5th.—The burner is the cause of generating the gas in a Lamp. It cannot do it in this Lamp, as the burner is set on a tube which contains no oil, consequently it cannot make any gas.



6th.—In case of accident, the Lamp falling or thrown over, by which many explosions occur, is the cause of the oil rushing to the flame. In this Lamp it is not so; it can be thrown over and cannot send the oil to the flame; it will run from it, so there is no danger of catching fire.

This Lamp can be filled from the fount, on the top of which is a screw.

This Lamp can be attached to any Chandelier or Bracket made.

State and County Rights for Sale. Agents Wanted.

An Important Work for Manufacturers, Chemists, and Students.

A HAND-BOOK
—OF—
CHEMICAL TECHNOLOGY.

BY RUDOLF WAGNER, PH. D.,
PROFESSOR OF CHEMICAL TECHNOLOGY AT THE UNIVERSITY OF WURTZBURG.

Translated and edited, from the eighth German edition, with extensive Additions, by WILLIAM CROOKES, F. R. S. With 336 Illustrations, 1 vol., 8vo. 761 pages. Price, $5.00

The several editions of Professor Rudolph Wagner's "Handbuch der Chemischen Technologie" have succeeded each other so rapidly, that no apology is needed in offering a translation to the public.

Under the head of Metallurgic Chemistry, the latest methods of preparing Iron, Cobalt, Nickel, Copper, Copper Salts, Lead and Tin, and their Salts, Bismuth, Zinc, Zinc Salts, Cadmium, Antimony, Arsenic, Mercury, Platinum, Silver, Gold, Manganates, Alnminum, and Magnesium are described. The various applications of the Voltaic Current to Electro-Metallurgy follow under this division. The preparation of Potash and Soda Salts, the Manufacture of Sulphuric Acid, and the Recovery of Sulphur from Soda-Waste, of course occupy prominent places in the consideration of chemical manufactures. It is difficult to over-estimate the mercantile value of Mond's process, as well as the many new and important applications of Bisulphide of Carbon. The manufacture of Soap will be found to include much detail. The Technology of Glass, Stoneware, Limes and Mortars, will present much of interest to the Builder and Engineer. The Technology of Vegetable Fibres has been considered to include the preparation of Flax, Hemp, Cotton, as well as Paper-making; while the applications of Vegetable Products will be found to include Sugar Boiling, Wine and Beer Brewing, the Distillation of Spirits, the Baking of Bread, the Preparation of Vinegar, the Preservation of Wood, etc.

Dr. Wagner gives much information in reference to the production of Potash from Sugar-residues. The use of Baryta Salts is also fully described, as well as the preparation of Sugar from Beet-roots. Tanning, the preservation of Meat, Milk, etc., the Preparation of Phosphorus and Animal Charcoal, are considered as belonging to the Technology of Animal Products. The preparation of the Materials for Dyeing has necessarily required much space; while the final sections of the book have been devoted to the Technology of Heating and Illumination.

D. APPLETON & CO., Publishers,
549 & 551 Broadway, N. Y.

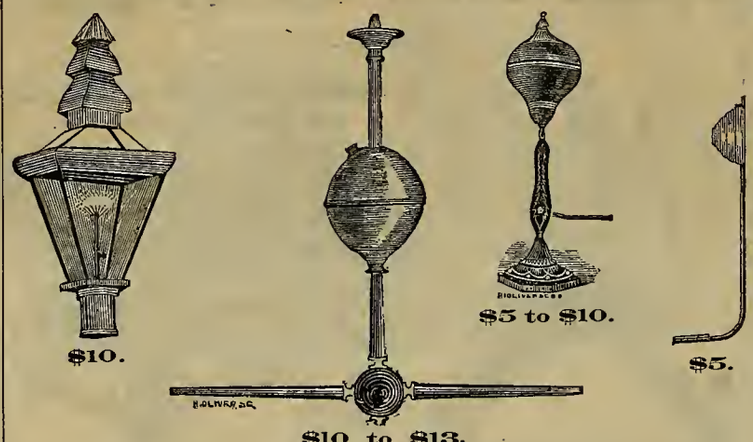
NEW GAS LIGHT.



THE PORTABLE SAFETY GAS LIGHT

Is suitable for city or country; just the thing for Churches, Dwellings, Stores, Hotels, Mills, Stables, Streets or any place where a light is required. Try it and you will use no other light.
It is the CHEAPEST, SAFEST and BEST LIGHT in use, costing only one-quarter as much as Coal Gas, and equally as good, giving a Clear, White, Brilliant Light. NO SMOKE OR SMELL! NO MORE EXPENSE FOR GLASS CHIMNEYS! Don't mistake this for any other Lamp or Burner, as there are several inferior and unsafe Burners in the market. Thousands are using it on the Pacific Coast.

It Can Not Be Exploded,

Each Burner generating its own gas only as fast as consumed, rendering Explosion impossible.
The Burner can be Regulated to give as much or as little Light as desired.
CALL AND SEE IT.
Lamps Wholesale and Retail. State and County Rights for Sale.

P. J. PHILLIPS & CO.,
17v4-13p No. 608 Clay Street, near Montgomery, SAN FRANCISCO.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular
GIANT POWDER, A NO. 2 GIANT POWDER,
Somewhat slower in its Explosion, which we recommend for
BANK BLASTING, COAL MINES,
AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD
It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.
Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.
BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by
HUCKS & LAMBERT.
The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus
Relieve the Draft of the Team,
Far beyond the reach of any who have hut recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as
LOW A RATE
As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

Betts's Capsule Patents.

To prevent infringements, notice is hereby given, that *Betts's name is on every Capsule he makes for the principal merchants in England and France,* thus enabling vendor, purchaser, and consumer not only to identify the genuineness of the capsule, but likewise the contents of the vessel to which it is applied.
The LORD CHANCELLOR, in his judgment, said that the capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

COMMENCING
Monday, October 7th, 1872.
And until further notice, Trains and Boats will
LEAVE SAN FRANCISCO.

7.00 A. M. (Daily). Atlantic Express Train (via Oakland) for Sacramento, Marysville, Redding, and Portland, O. Colfax, Reno, Ogden and Omaha.

7.15 A. M. (Daily). Cal. P. R. R. Steamer (from Broadway Wharf)—Connecting at Vallejo with Trains for Calistoga, Knight's Landing and Sacramento; making close connection at Napa with stages for Sonoma.

2.00 P. M. (Sundays excepted). S. F. & N. P. R. R. Steamer (from Broadway Wharf), connecting at Donahue with Trains for Cloverdale. Making close connection at Lakeville with stages for Sonoma.

2.00 P. M. (Sundays excepted). Stockton Steamer (from Broadway Wharf), touching at Vallejo, Benicia, and Landings on the San Joaquin river.

3.00 P. M. (Daily). San Jose Passenger Train (via Oakland), stopping at all way Stations.

4.00 P. M. (Sundays excepted). Passenger Train (via Oakland) for Lathrop, Merced, Visalia, Tipton, and Los Angeles, Stockton and Sacramento.

4.00 P. M. (Sundays excepted). Cal. P. R. R. Steamer (from Broadway Wharf) connecting at Vallejo with Trains for Calistoga, Knight's Landing and Sacramento.

4.00 P. M. (Sundays excepted). Sacramento Steamer (from Broadway Wharf), touching at Benicia, and Landings on the Sacramento river.

6.30 P. M. (Daily). Overland Emigrant Train (via Oakland)—Through Freight and Accommodation.

OAKLAND BRANCH.—LEAVE SAN FRANCISCO, 7 00, 8 10, 9 24, 10 10 and 11 20 a. m., 12 10, 1 50, 3 00, 4 00, 5 15, 6 30, 8 15 9 20 and *11 30 p. m. (9 20, 11 20 and 3 00 to Oakland only).
LEAVE BROOKLYN (for San Francisco), *5 30, 6 40, 7 50, 9 00 and 11 00 a. m., 1 30, 2 40, 4 55, 6 10, 7.55 and 10 10 p. m.
LEAVE OAKLAND, *5 40, 6 50, 8 00, 9 10, 10 00, and 11 10 a. m., 12 00, 1 40, 2 50, 3 50, 5 05, 6 20, 8.05 and 10 20 p. m.
ALAMEDA BRANCH.—LEAVE SAN FRANCISCO, 7 20, 9 00, and 11 15 a. m., 1 30, 4 00, 5 30, and 7 00 p. m. (7 20, 11 15, and 5 30 to Fruit Vale only).
LEAVE HAYWARDS (for San Francisco), *3 45, 7 00 and 10 45 a. m., and 3 30 p. m.
LEAVE FRUIT VALE, *4 40, 7 35, 9 00 and 11 20 a. m., 1 30, 4 05 and 5 30 p. m. *Except Sundays.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 9, 1872.

VOLUME XXV. Number 19.

D. C. Gilman, President of University of California.

We present herewith a portrait of the gentleman who was inaugurated, on Thursday last, as President of the University of California. The engraving was drawn from a photograph kindly furnished us by an Oakland lady, and has been executed on wood by our own artist, especially for the columns of the SCIENTIFIC and RURAL PRESS. The photograph, we judge by the maker's imprint, was taken in England, and probably within two or three years past. The engraving will be remarked as a very correct likeness by those who know him.

President Gilman was born in Norwich, Conn., in 1831, and in his boyhood removed with his father's family to the city of New York, where he was fitted for college. He graduated at Yale in 1852, and after a year of past graduate study, partly in New Haven and partly in Cambridge, he went to Europe as an attaché of the American legation at St. Petersburgh. He spent a winter in study at the University of Berlin, and was afterwards Secretary of the Commissioners to the Paris Exhibition of 1855. His time in traveling was largely devoted to the study of educational and charitable institutions. On his return to New Haven he became interested with others in the establishment and development of the scientific department of Yale College, which has now become the Sheffield School of Science. He was librarian of the college from 1856 to 1865, and Professor of Physical Geography and History in the Sheffield School from 1863 to 1872. For several years he was also Superintendent of the City Schools of New Haven, and subsequently State Superintendent of Instruction in Connecticut. He has written for the *North American Review*, the *New Englander*, the *Journal of Science*, and other periodicals, and has printed several public addresses, but has published no volume.

In addition to his other duties Professor Gilman held the office of Secretary of the Sheffield School of Science, a position attended with much labor, but at the same time one giving rare opportunities for becoming familiar with the working and wants of such an institution. He comes among us young in years, but ripe in scholary attainments, and especially familiar with what is useful in building up a great institution of learning, such as we are now endeavoring to make the State University at Oakland. We have no doubt but his inauguration to the Presidency of that institution will prove an important era in its history. We bespeak for him a hearty welcome, and earnest support from all who are interested in the great cause of education.

SHORT WATER SEASON.—Notwithstanding the large fall of rain and snow in our mountains last winter, affording a flush supply of water everywhere in the spring, the flow seemed to stop suddenly at an early date. Many miners are puzzled to account for this. We think it is owing partly to two reasons. To the excessive dryness of the earth, extending to an unusual depth in place, owing to repeated dry seasons, and to the fact that the time was short during which the large body of rain fell last winter, causing a large proportion to run off at once, and not giving time for soaking deep into the ground. The hills adjoining Oakland and Brooklyn, in Alameda County, we observe have been dryer this year than in what have been termed our dryest seasons, more springs and wells having completely dried up.

Variations of the Needle.

The subject of electricity is as yet but imperfectly understood, and we have much to learn in regard to the laws controlling it. At the last meeting of the California Academy of Sciences, C. D. Gibbes, Civil Engineer, made some interesting remarks on the subject of variations of the needle, and said his attention had been called to this particular subject from having been recently engaged in sub-dividing several thousands of acres of swamp lands on the San Joaquin River; a place where one would least expect to find any local attraction to disturb the needle. Nevertheless he had experienced great difficulty in connecting with old surveys, and had found the needle to vary more than one degree on the same line, one mile apart. Both observations were taken on the same tall flag, and the line established by fore and back sites with a transit, one station being on dry land, and the other in a dense body of tules, dry and green together, with water one foot deep, and wind from the west. A difference also frequently occurs between open grass land and heavy tules, more than would be occasioned by the diurnal variation.

Now will the wind, by agitating the tules producing friction of the dry piths of the dead tules, create electricity so far as to effect the needle? This is a question that should be investigated thoroughly. Mr. Gibbes suggested that the Academy request all civil engineers to give the results of their experience, with regard to local attractions or disturbances of the needle in different parts of the State; and the facts thus collected may throw some light on the subject. In a previous communication on the subject Mr. Gibbes stated that his needle had been twice affected by a dry northwest wind, causing it to adhere to the glass. The same thing had occurred to Mr. Hunt, County Surveyor of Contra Costa.

DANIEL C. GILMAN, PRESIDENT OF THE UNIVERSITY OF CALIFORNIA.

Professor Geo. Davidson, in reply to Mr. Gibbes, said he was convinced that the variation was from no other cause than the effect of iron deposits in the earth, and it could be obviated by elevating the needle in the same manner as the compass on an iron ship.

STEAM UNDERGROUND.—In some of the English mines, steam generated at the surface is conveyed in pipes to engines below, and in one example the steam passes through 4-inch pipes, 2,338 feet, losing only half a pound pressure per square inch.

GOLD quartz is said to have been discovered in Westchester County, New York.

Academy of Sciences.

At the regular meeting of the California Academy of Sciences, held Nov. 4th, the following new members were elected: Rev. A. J. Nelson, James G. Steele, Rev. Dr. Wythe, Rev. Otis Gibson, John S. Bngbee, James F. Bowman, G. D. Wyman, B. Howard Coit, Lieutenant Commander Henry Glass, U. S. N; Richard S. Floyd and Peder Sather.

Donations to the Cabinets.

A nnmber of contributions to the cabinets were received as follows: nest of marsh wren (*Trogolodytes Palustris*) composed of different grasses ingeniously woven together, from Mr. Gibbes; frogs from the swamp lands, of the the family *Hylidae*; plants from swamp lands by Mr. Gibbes. Among them were the tule potato, so called from being found in swamp lands amongst the tnles. The bulb is about the size of a hickory nnt, and it is fine food for swine, The Chinese collect large quantities of the bulbs for food, and it may be that it might be improved by cultivation. A vegotable called the wild artichoke, but in reality not belonging to that family. It is eaten by swine. A small rush, which may eventually become nseful for the manufacture of hats. The wild hollyhock, supposed to be of the same family, found generally on the banks of rivers in grass lands. It bears a white flower with crimson centre.

The first lobster found in the waters of the Pacific was presented by S. R. Throckmorton. It was about one third the size of those found on the Atlantic coast, but the fore claws were proportionally larger.

California Chestnuts.

Dr. Kellogg said he had jnst returned from under the shadow of the finest evergreens ever grown. He hoped the Secretary would record the fact that there were in California true Chestnut trees *(castana chrysophylla)* from 100 to 200 feet high, 4 to 6 feet in diameter, and with a clean trunk of 50 to 70 feet. This fact had hitherto been doubted, although he had stated it before the Academy several times. He had on the trip also met with *rhus aromatica*. A new plant, described by him was an *hibiscus* or kind of wild hollyhock, having a strong fibre similar to the ramie; the first ever collected in this State. It was found by Mr. Gibbes. *Hibiscus Californicus* —Kellogg, is from 4 to 6 feet high.

The Tule Potato.

Mr. Bloomer read a paper on the plant presented by Mr. Gibbes describing it as a *Sagittaria*. It is indigenous to California and the bulbs or roots are edible. The Pacific Railroad reports say it is eaten by the Indians, who term it Wapatoo. Dr. Kellog said it was also consumed by the Chinese in large quantities. Mr. Bloomer also said that the plant known to settlers along the San Joaquin as the wild artichoke was *Lycopus Europaeus*, commonly termed "water horehound." It was widely separated from the Jerusalem artichoke.

California Glaciers, Etc.

Professor Carr read some interesting extracts from letters from a student who is traveling in Yosemite, describing living glaciers in that locality. Professor Davidson said if this were the case that it was the lowest latitude in which we find the living glacier. This one is, however, small.

Dr. Dall read a report of recent explorations in Alaska, describing some pre-historic remains. We will give this paper in full in our next issue.

The paper read by Dr. Stout on the horse disease will be found in another column.

NEW ROUTE OF TRADE.—Part of the bullion product of the Cerro Gordo and Owen's River mining districts is now sent by the San Joaquin Valley Railroad to this city, and by the first of December all the trade with these sections will be carried on by this route *via* Tehachapi Pass and Bakersfield to the terminus at Tipton, instead of *via* Los Angeles as formerly. The opening of the new route was inaugurated on the 2d inst., by the arrival of three large mule teams with 30,000 pounds of bullion, at Bakersfield, Kern County. Large numbers of teams will be kept running.

Commercial Reporting.

This is the newspaper age—the era of reporters. And truly wonderful is the proficiency that the latter have attained in their art—for successful reporting is an art. They are, in fact, to the outside world what the schoolmaster is to the child; they are foremost amongst the educators of the day. They have in their day overcome much prejudice, and succeeded in making themselves recognized in perhaps the greater part of their peculiar domain. There yet remains for them reportorial worlds to conquer. Commercial reporting, for instance, may as yet be said to be only in its infancy. This, however, rather on account of an unreasoning prejudice amongst those who are applied to for information, than any lack of skill on the part of the professional. It will be some time yet before this prejudice is removed, and before business men will see the propriety of giving such information to respectable journals as shall enable the commercial newspaper to give an accurate

Photograph of the Business World.

That such a picture is not now obtainable is self-evident.—in fact the business man has to depend largely on his own knowledge of movements in the business world for the information that is indispensable to him. So that when he sees it in the newspaper there is nothing that is new to him, and the former but serves as a commercial record to which he can refer to refresh his memory as to what was thoroughly well known to himself in the past. But, after all, what is this record? It merely contains such information as to arrivals and departures of ships, imports and exports, sales and prices as the magnates on 'change wish to make known, and it is frequently inaccurate, often designedly so. It does not contain full reports, even on all these subjects. There are, for instance, no reliable statistics of imports, save those on which duty is paid, and of which a record is kept at the Custom House. The sales quoted are only a few of those effected every day, and often do not at all represent the state of the market. Frequently enough the prices are not given, and even when they are they are rumored to be not always those offered or accepted. It is seldom that the stock on hand of any article can be ascertained, the stock to arrive, or

The Needs of the Market.

Figures given, when they are given, are merely approximations. And it is only once in a hundred times that the true state of the harvest, say in coffee, sugar, etc., is ascertained. And all this in regard to the transactions that may be observed on the surface of the commercial world, for after all were all these items ascertainable in a correct form, that is all they would represent. Sales would often be found to be made in response to the demands of the customers not other agents, but through a merely speculative spirit, and prices would be found to rise and fall through similar influences. The real

Demands of the Market,

From day to day, and year to year, can only be ascertained by finding out the correct amount of sales made by retailers, the real stock in their hands, the real requirements, and the state and demands of the population to whose wants they minister. The state of the crop can only be ascertained by having trustworthy agents in the localities where it is grown, and the quantity of it available for any particular market, can only be known when the surplus is known and the prospective demands of the various countries which form the particular source are supplied. How few of these items of information are ever known thoroughly or accurately, but they should be known in the interests alike of the producer, the buyer, the seller and the consumer. Such information as this can be collected only by

Bureaus of Commercial Statistics

Continually receiving reports from all classes of tradesmen, wholesale, jobbing and retail, having special agents in foreign countries to make crop and market reports, and special agents in local markets to ascertain that information which prejudiced parties would be unwilling to give. The value of the reports obtained by such agency is self-evident. They would keep everyone interested, thoroughly posted all the time on the most minute details of the wholesale and retail markets, on sales, prices, stocks, wants, etc. They would save to many thousands of dollars yearly, would save many from irretrievable ruin, and would check more, if not altogether abolish, the spirit of speculation and reckless trading. They would, in fact, really fill the position now imperfectly filled by Merchants' and Produce Exchanges. Such institutions are naturally those that should undertake this business. They have a thousand opportunities for obtaining special information which those outside could never have, and they already fill the position to a certain extent. The way lies unobstructedly before them, and by following it up they will be enabled to satisfy to-day what is one of most pressing wants of the mercantile world.

Large Casting.—Preparations are making at Woolwich Arsenal for a casting which is said to be the largest ever attempted, being intended for the anvil-block of the 30-ton Nasmyth hammer, which is to be erected in the new workshop of the Royal Gun Factories. It will weigh more than 100 tons.

Advance in the Price of Metals.

The prices of metals have advanced so largely within the past few months that we presume a few words upon the present remarkable features of the market and the cause of the advance in prices, may not be altogether uninteresting to many of our readers.

Iron.

The condition of the iron market at the present time is in many respects without precedent in the history of the trade. With every furnace in blast, and importation as large as the very limited surplus of foreign production will permit, there is still a great scarcity of manufactured iron. Since January 1st American Pig No. 1 has advanced from $36@$37 to $56@$57 per ton. The chief cause of the rise in this article is doubtless the enormous impetus given to railroad building since the closing of the Franco-German war unlocked European funds. The substitution of iron for wood in the construction of steamers and sailing ships of late years has greatly increased the consumption of iron, but the remarkable spread of railroads, not only in the United States, but recently throughout the entire world, may be called the principal reason for the great demand for iron, and the wonderful increase in the consumption of this important metal. In England, Scotland, Prussia and Russia—especially in the latter—railroads are building with marvelous activity. The exports from England of railroad iron, hoops, sheets and plates, have increased this year to Germany, Holland, Sweden, Spain, Austria, Egypt, Brazil, Peru, Australia, British America, and United States. Apparently this is only the begiuing of a revival in trade, as after a run of several years of depression business generally became suepended, many undertakings had to be abandoned or neglected until a more propitious season should present itself. Consequently the amount of work now in hand, to some great extent, belongs to previous years, and the present time is only making good what would in the ordiuary course of events have been done long ago. The spirit of enterprise, however, is now not only redeeming the past, but straining to keep pace with the requirements of the age. The anticipations of the future have yet to be realized, but as supplies still continue to be inadequate to meet the present wants, it is difficult to conjecture, with any degree of certainty, how long present prices may continue. It is but natural to suppose that the high rates which ores command would stimulate production, and that with increased production there would be a proportionate fall in the value of iron; but hitherto the supply has been insufficient to meet the ever growing demand; and if generally received information may be relied upon, contracts have been accepted for fulfillment next year, on such a scale as shall result in the maintainance of high prices for some time to come.

The scarcity and high price of coal in England is another cause for the advance in iron. One reason for the extreme prices of coal is without doubt the greatly diminished production, for as the men have got greatly advanced wages the quantity of coal they turn out is reduced, and thus a scarcity is induced which was never before known. There is considerable difficulty in getting manufacturing coal. Numerous manufacturing companies in various parts of England are absolutely closed for want of coal, and may continue so for some time.

Tin Plates

Have advanced to prices unprecedently high, the prime cause of which is the late enormous advance in pig iron and fuel. Almost all the factories where coal is used in large quantities are suffering from its short supply. Many of the tin plate manufacturers are actually without fuel to commence the next day's work. They are behindhand in the delivery of their orders, which has had the effect of rendering stocks very small, and the price of tin plates, which was originally affected by increased cost of material, is now being further advanced from inability of many manufacturers to deliver orders. Whether tin plates will be much higher within the next few months will depend greatly on the supply and demand, although it may be many years ere we shall have the extremely low rates that once ruled for so long a time.

Inventions Needed.—The *American Artisan* asks inventors to turn attention to the following much-needed machines: A ditcher that will cut a narrow ditch for the reception of drain-tile; an apparatus to be drawn by horse-power and capable of laying the tiles in the ditch when formed; a mole plow which shall make a subterranean drain that will not choke up in a year or two; an efficient potato-harvester; a stone-gathering machine capable of clearing a field of stone and piling the same in winnows; the stone for walls, the field for smooth-rolled meadows fit for easy mowing with a machine; a sowing apparatus that will sow beans and peas as effectually as the common grains are sowed; a small machine for pulling flax; a small power-accumulating wind-mill, not to exceed in cost to ner more than $15 or $50, for churning and similar purposes; and an automatic sheaf-binder for harvesters.

Diamonds in New York.

This country is rapidly advancing in all that tends to promote its general prosperity, and promises soon to surpass foreign nations in the prosecution of those arts which they have always deemed their specialties. Until a very recent date, Amsterdam has held the monopoly of the business of cutting and polishing diamonds, and by the experience of hundreds of years, during which period generation after generation has been born to and educated in the art, that city has attained an almost world-wide renown. Some years ago, however, a firm in Boston became engaged in the pursuit and has met with well-deserved success; but their attention was chiefly directed toward the repairing of diamonds, involving the reforming of the stones, and, of course, the repolishing. It was reserved for New York to go into the business thoroughly, and, much to the satisfaction of the leading jewelers of the country, the venture has proved more than successful.

Not long since several gentlemen of this city determined to organize a company having for its object the formation of a diamond market here. This was no small task. It required a large outlay of capital. It was necessary that the most experienced workmen in Amsterdam should be induced to come to this country to give us the benefit of their experience. Machinery had to be invented which should, if possible, surpass in efficiency that used in Amsterdam. These difficulties were overcome; the capital was obtained. Hollanders of long practice signified their willingness to embark in an enterprise which commended itself to their common sense. Machinery was invented which fulfills the requirements of the business, and just a year ago the "New York Diamond Company" began operations, having for President Mr. Isaac Hermann. The process of preparing diamonds for use is of singular interest. The business is divided into three distinct branches, and such is the proficiency necessary in each branch that it is extremely seldom that a workman can be found who is master of all three.

The rough diamond is first handed to the "cleaver." He is expected to see in an instant where any flaw in the stone is situated; he must be able to tell what parts must be split off in order to get rid of any flaw, and at the same time retain as much weight as possible, with the greatest brilliancy. He calculates how much the clippings will be worth, whether they will make small brilliants or rose diamonds, and having reached his decision he fastens the stone in the end of a wooden stick, securing it by a cement made of rosin and brick dust. Another diamond, already split and having a very sharp edge, is served in like manner, and with this he cuts a notch in the diamond he is about to split. This operation is performed over a small box containing a sieve which catches the diamond dust. The notch being made, the cleaver takes a small steel rule, which he places on the line in the direction of which the cleavage should be made. Having, apparently, taken his aim, he places the ruler in the notch, and with one or two quick taps with a steel rod the stone is split. Heating the cement, the workman removes the diamond; it has been so split that the flaw has been entirely removed. The diamond may be worth hundreds, perhaps thousands of dollars, and any ignorance or error on the part of the cleaver might destroy for his employer more than they could recover in weeks.

From the cleaver the stone is passed to the "cutter," and secured in exactly the same way. The diamond to be shaped is held in the left hand, which is protected by a heavy leathern glove. In the right hand is the stone which is to be used in grinding down the facets of the diamond which is under treatment. The process is very slow, and when the stone leaves the hands of the cutter it has lost whatever brilliancy it may have had, and looks more like a common pebble. But now comes a great transformation.

Visiting the polishing-room the attention is first attracted by what seem to be round steel tables. Upon closer examination these are seen to be the disks, which are used in polishing the diamonds. They are making 2,000 revolutions per minute, and are covered with a compound of oil and diamond dust. The first process is to solder the stone into a sort of brass cup, leaving visible only that portion of the diamond which is to be polished. Taking into consideration the fact that every stone has sixty-four different surfaces to be polished, it will be immediately seen how difficult the work of this operator is, and how exact he must be. Taking the stone he places it in the solder, now in almost a liquid state, and with his fingers shapes the metal around the diamond. This is then plunged into water, and as the steam arises from the molten mass, one naturally turns to see if the workman is provided with hands of iron. But no—practice has made him invulnerable.

The polisher now takes the diamond, touches the point with the oil and diamond dust, clamps the cup containing the precious stone in a wooden rest so that the diamond shall just touch the polishing disk. By weights he regulates the pressure. Experts will have three diamonds undergoing this process at the same time, and yet they seem to pay but little attention to their work—so little, in fact, that one might well wonder whether they are taking any interest at all in what they are doing. But little does the observer realize the years of patient toil that has enabled the operator to attain his great proficiency. At times a stone may be so hard that months are required to give it the proper brilliancy; but, sooner or later, the lustre appears, and what has been the object of so much solicitude and labor, finally comes out a perfect gem."—*New York Tribune.*

From the San Feliciano Mines.

A day or two ago, says the Los Angeles *News* Judge Joel Turner, formerly Mayor of this city, returned from the San Feliciano mining region, situated on the Temescal grant, at about fifty miles from this city. The San Feliciano mines are supposed to be the oldest placer mines in California. The banks containing the auriferous deposits are from seventy to eighty feet in depth, from surface to bed rock, and are of a cement nature, the gold being well disseminated throughout. A scarcity of water existing in that vicinity, the mines have been unproductive. At present, what work is being carried on is done with the water collected into a reservoir from a spring, enough water being thus collected to do one-half hour's washing out of the twenty-four. The gold obtained is of a coarse and heavy character. There is but one claim there which is worked by Americans, and a few native Californians are engaged here and there in the district mining for gold, and making from one to one and a-half dollars per day.

The Temescal grant, upon which the mines are located, was granted to Deda Questa, and by him sold to Harpending, Hydenfelt & Co., who now hold it.

Judge Turner brought with him some iron-stone pebbles, found in the clay indicating the presence of a vein of that mineral somewhere in the vicinity. He also brought with him some petrified bones, evidently the remains of a horse, found at a depth of between seventy and eighty feet from the surface. The enamel of the teeth has been converted into rock resembling quartz. We learn that the bones of animals have been found in these deposits at various times before, which leads us to believe that the region must have undergone a sudden and entire change at a comparatively recent period, as the process of petrifaction is as yet incomplete in some of the remains found.

Hayden's Yellowstone Expedition.—A correspondent of the Helena *Herald*, writing from Bozeman, Montana, October 14th, says: "Recent advices from Mr. Stevenson, Director of the Snake River Division of the U. S. Geological Survey, announces the arrival of the entire party at Fort Hall, on the 11th inst., crowned with success. The entire Snake River Basin has been carefully explored by them. The party reached the Geyser Basin the last of July; obtained supplies from Virginia City, via Madison valley. They followed the Madison river to its source in a small lake, and crossed the divide to Madison lake. They found that Madison lake had no connection with Madison river. It had an outlet about 100 feet wide, flowing in an opposite direction from the one given on the maps, which they followed to its entrance into another lake about five miles wide; this proved to be the real source of Snake River. They found a Geyser basin near the sources of Snake River, with about two hundred springs, of all sizes, some of which spouted eighty to one hundred feet in hight. The division, under the direction of Professor Hayden, reached Bozeman to-day, having completed the season's labors. Every step has been a success, and the amount of valuable material of scientific and practical value exceeds that of any previous year. The entire party proceed at once to Washington, to prepare the report to be presented to Congress for publication at an early date.

Extent of American Peat Fields.—Mr. W. S. Tisdale contributes to the *Coal and Iron Record* an interesting record on the extent of the peat fields of this country. According to his estimate, our supply of this fuel will exceed that of Ireland one hundred and fifty times. In Orange and Rockland counties, N. Y., the peat beds contain, at a low estimate, 225,000,000 tons. Beds are also known to exist in over 100 different towns of Massachusetts. The Dismal Swamp of Virginia will yield 500,000,000 tons of peat. There are 4,000 acres in one body in New Jersey, and there are similar bogs in all parts of the State. There is a peat bed in Westchester county, N. Y, which will yield 900,000 tons. Long Island has millions of tons. Along both sides of the Kankakee river, Indiana, extending from South Bend to the Illinois line, is a peat bed more than 60 miles in length, with a width of three miles. In some places it is over 40 feet deep; but even though it average only half or even one-quarter of this depth, the aggregate amount of fuel it contains is beyond comprehension. This, Mr. Tisdale states, does not include one fiftieth part of the peat bogs of the country.

Chemical Laboratories in Japan.—There are at this time four chemical laboratories in Japan, where the science is taught, three of them being presided over by Germans and the fourth by an American. The chief one is at Osaka, where there are nearly one hundred students. The rest are at Kaga, Shidzoka and Fuwuki. A fifth will soon be opened at Jeddo. The students are said to be fairly intelligent, but their minds are at present encumbered with astrology and other kinds of spurious philosophy.

MECHANICAL PROGRESS.

Imperfect Constructive Materials.

Much haa been eaid of late about the imperfect character of a large portion of the constructive materials now in nse, and the large advance required for that which is enperior in character. There is also a growing tendency, especially on this continent, towards imposing upon euch materials all the strain they will bear. The question of safety is qnite too little considered, economy and lightness being the ends mainly kept in view. Our civil engineers continue to plan larger and bolder bridge structures, snd more extensivo and complicated deeigns for warehouses, etc., while our mechanical engineers are building largor engines, increasiug their stoam pressures and tbe speed of their working machinery without making due allowances for the increased pressure thereby imposed upon the various parts of snch structurcs and macbinery.

Engineering, in allnding to tbo above facts, aSks:—"In what direction aro we to look for improved constructivo materials, and how can the discovery and commercial manufacture of such materials be bost promoted?" In reply to the latter portion of the qnery the editor of the paper qnoted calls attention to a very important mstter in connection with the production of constructive materials in the following words:—

"If an engineer now-s-days is called npon to construct a bridge of nnusually large epan, or if a mechanical engineer hss to mske an nnusually light boiler capable of etanding a high pressnre, he is not content with employing the constructive materisls ordinarily found in the market, but specifies for steel or iron capable of resisting satisfactorily high-test etrains. Under these circnmstancee he may obtain a matorial having a constructive value eome 20 or even 30 per cent. grester than the average of that ordinarily manufactured, bnt he will, of course, hsve to pay for tbie advantage a considerably increased price.

Now, althongh this increased price is partly no:essitated by increased cost of production, it is in very many cases due to no unimportant extent merely to tbe fact that the demsnd for very high-class material is an exceptional one. Tbe furnishing of snch material, in fact, necessitates the manufscturers departing from his nsual routine of business, and hence expenses are incurred whicb would vanish if the demand for the very best materials was constant instead of intermittent. In other words, we believe that nsere of iron and eteel could obtsin a considerably bettor average qnslity of msterial at a very moderste increase of price if they would simply take tbo trouble to sscertain systematicslly the qnality of the msterials they employ.

What is wanted is s more general abandonment of the brute strength system of construction, snd a more rigid epecifying of good materials combined with careful testing, to insnre that such materials are supplied. With a more general demand for high-class products, there would be an increased development of the manufacture of snch products, and mnch of the energy and skill now devoted to producing materials which are exceedingly cheap would he more profitably turned to account in manufscturing products which should be exceptionally good.

An Invention Wanted.

Engineering, in an article on Constructive Materials, says there is a great need of an alloy of steel which will retain the strength of the preeent caet-steel, and at the same time poseees a lower melting point and increased fluidity. Ae eteel is now made, the excessive high temperature at which it is necessary to run the steel, and consequently the great ehrinkage which takes place during the cooling, is a difficnlty in the way of producing castinge of a complex form, or having parts of very limited thicknese; while the greater or lese poroeity of many of the csstings renders them inapplicable in numerons instances where tbeir great strength would otherwise render them specially valuable.

That such an alloy, or its equivalent, will ultimately be discovered, *Engineering* thinks there ie no great reasonable doubt, and adds:

"The whole subject of alloys is one of vast importance, and one which has never yet received the full attention it deserves. * * * An important inetance of the effect exercised on the properties of a metal by the admixture of foreign eubstances is afforded in the

'Phosphor-Bronze'

Of Livi and Kunzel, and as this alloy promieee to become one of the 'materale of the future,' we may eepecially advert to it here. From particulars of careful experiments with this material, now before ne, we find that the addition of a very small percentage of phoephorue to gun-metal containing ten per cent. of tin, increased the elaetic limit about 35 per cent., and the breaking-etrain per sqnare in. of the original section 80 per cent; while one sample of phosphor-bronze, containing 6.2 per cent. of tin had n breaking strain of over 51,000 lbs. per sqnare in. of original section, and elongated 10 per cent. before fracture.

"Judging from the samples wa havo ecen, also, the phosphor-bronze appears to be capable of making very close and dense castings, while the property it possesses of casting well in metal moulds is one of very great value in many instances."

New Process of Combining Iron and Steel.

A process for combining iron and steel bas recently been invented by Mr. E. Wheeler, of Philadelphia, for wbich some novel and nseful features sre claimed. Tho principle of this inventiou consists in bringing the two metals to a woldiug heat in one "pile," and then eubjecting them to a rotary motion. Tho chief difficulty hitherto experienced in effecting the union has been that, when the steel is subjected to the welding heat of iron, it is injuriously affected by the temperature, and assumes that appearance technically known as "burnt." While the use of proper fluxes may reduce, or even obviate this tendency, their employment is objectionable on eeveral accounts. In Mr. Wheeler's process the combination ie effected, and tbe steel protected from oxidation by being enclosed in an iron case, made as nearly air-tight as possiblo. The following applicatione of this invention are proposed: First, the reduction of eteel into an iron-coated steel elab, plate, or bar, in whicb eteel predominates; second, the production of steel-centered iron, in wbich iron is the principsl metal used; and third, a combination proper, in which the steel is so proportioned nnd placed as to endure wesr and support strain.

This process has already received high enconiums from technical journals, and has given good results in practice. Its simplicity is one great recommendation, and commends it to the attention of manufscturers. Alluding to some of its applications, the inventor says: "In the rspid aud economical manipulation of scrap steel of any kind by this procese, the advantage over the old methods is so great as to leave no question of competition. Cast-steel ecrap, when encased in iron as described above, csn he rolled into finished bar at one operation, and even Bessemer steel scrap, wbich has hitherto defied every attempt to weld it up into a sound mass, is by this process reworked from sny size of "pile" into any desired shape of rail, bsr, or plate, as sound and homogeneous as from the original ingot. The great importance of thie festure of tbe inventiou to the railrosd interests of tbe country will be obvious to all those managers who have adopted eteel rails, or who have contemplated eo doing, and have felt that eooner or later they must meet tbe question—'What shall we do with Bessemer scrap?'"

Barron's Process for the Manufacture of Steel Tools,

Or rather, for the conversion of iron tools into eteel—is now in operstion in Lonisville, Ky., where it has attracted no little attention, and hss met with very encouraging snccees. Tools which are to be prepared by this procees are first msde of cast-iron, sfter which they are introduced into a revolving drum, where the roughness and adhering sand from the moulds are worn off by attrition. The emooth irons are then packed in layere in iron boxes, where they are closely embedded in clay, and subjected to the action of oxide of iron and certsin chemicals, by which the iron ie decarburized. There eeems to be a secret connected with this part of the process. In these boxes the iron tools are subjected to sn annealing heat, which ie maintained from three to six days. They are subsequently plsced in a retort capable of containing about a ton of the tools, into which the vapor of gasoline and other carbonaceous mar iale are passed. In a few minutee the iron is traneformed into steel, when they are ready to he tempered, and ground and polished for the market. The explanations of this procees are not ae clear ae they might be, bnt of the quality of the eteel tbus produced there is very little queetion. Prof. J. S. Newberry, of the School of Mines, Columbia College, New York, referring to thie subject, saye: "With tailor'e shears cast in shape, made malleable, and then converted by the Barron procese, I have cut Florence silk so nicely ae to prove the edge perfect; then, with the eame ehcars, have cut up eheets of tin and untempered steel; returning to to the silk have fouud the edge wholly unimpared, and thie after a repetition of more than twenty times." By whatever process steel of thie description is made, ite exceeding valne mnst create for it a wide demand, and soon render the method by which it is made widely celebrated.

MARBLEIZING SLATE.—The following is the new process employed for making slate assume the appearance of marble, for decorating interiors: After being properly cut and trimmed, it is ecoured with pumice etone, then rubbed with powdered pumice etone, and polished with felt. It ie now ready to be transformed into marble. The elabe, having been painted with the gronndwork color, are ready to dip. A vat containing water mixed with ox gall, on which the colors are floated, ie at hand. A hrueh is dipped in the colore and eprinkled on the eurface; then the water ie fanned with a palm leaf and the brush drawn throngh several times. The mixed paint spreads on the surface of the water like veining in marble, and the slab is then lowered until it touches the surface, when tbe floating color adberes to it; it is then put to dry. After the application of colors sundry bakings and polishings finish the work. Tbis marbleised slate is quite elegant, possessing sixteen times the strength of marble and scarcely distingnishable from it.

SCIENTIFIC PROGRESS.

Zoellner's Theory of Terrestrial Magnetism.

Zoellner proposes a new tbeory in regard to the origin of terrestrial magnetism. He adopts the idea of drift currente upon the liquid surface of the sun, by means of which he tries to explain tho movemente of tho sun-spots. These drift-currents originate, according to bis conception, from the current of best continually ascending from tbe interior, and from the rotation of the sun. Such currents, Professor Zoellner maintains, exist in all rotating cosmical bodies, even after tbe surface, cooled by radiation, has become rigid to a certain extent. Tbis is the case with the earth, and the continuous regular currents of the interior liquid mass produce different effects upon the outer shell, mechanical, thermal, and also magnetical, the latter as a necessary consequence of the electricity originated by the currents. Zoellner further maintains that by thie hypothesis the general phenomena of terrestrial magnetism msy be satisfactorily explained, and thst they are related to the currents of the inner liquid mass, and whatever effects theee currents, as, for instance, volcanoes, reacts immediately upon the magnetism of the earth. Whenever n cosmical body becomes entirely solid, no induced magnetism can exist; so our moon, which appears entirely solidified, and in which all volcanic action has ceased long ago, has no influence on the terrestrial compase-needle.

That terrestrial magnetism is caused by electric currents runniug from east to west under its surface, and which compel the compass-needle to place itself at right angles with the current, thus in a north and south direction, according to tbe law discovered by Oerstedt, in 1819, wse already suggested hy Ampere forty years ago; but to apply this idea to cosmical bodies in general, and even to the eun, where a temperature prevails excluding sll magnetic action, according to our preeent experience, ie an idea entirely orignal with Zoellner, and if it were not supported by eo eminent a nsme as Zoellner's, we would not take any notice of this theory.—*Exchange.*

Phenomena of the Spheroidal State of Liquids.

At the recent meeting of the British Aesociation Mr. W. F. Barrett read an interesting paper upon the conditione affecting the spheroidal etate of liquids and their possible relstionship to eteam boiler explosions. It appesrs, in brief, that he has found that tbe preeence of alkalies or soape in water quite perceptibly aids in the production of the phenomenon of the spheroidsl state. He relatce as oue experiment, which first drew his attention to the subject, that having occseion once to cool a red-hot copper ball, he plunged it into some water in which he hsd just washed his hands. He etatee that, to his surpriss, the ball entered tbe water without hissing, snd without visible evolution of steam, snd on being removed was appsrently as hot ae before.

This sccidental obscrvation led to experimente, with a view of ascertaining the causes of this curious pheuomena, since it appeared impossible that the epheroidal etate could be maintained with water by a body at so low a temperature. Fresh water wae tried, hut with a different result. The hall, upon immersion, evolved a lond hissing sound and gave off a copione discharge of steam. By adding s little eoap to the water, he was enabled to reproduce the phenomenon at first observed, the ball entering the liquid quietly. Albumen, glycerine, and organic eubetances generally produced the eame results.

The bcst method of reproducing the phenomenou, the autbor eays, is to make use of a eoap solution mixed with water, and to plunge into this a white-hot copper ball about two pounds in weight. The ball enters the liquid smoothly and quietly, and glowe white-hot at a depth of a foot or more beneath the surface. Even against so great an hydrostatic pressure, tbe ball will he surrounded with a ehell of vapor perhaps an inch in thickness. The total reflection of the light from the bounding surfacee of the vapor hubble eurrounding the glowing ball, gives to the envelope the appearance of burniebed silver, making the experiment quite an interesting one. As the ball gradually cools, the bounding envelope becomes thinner, and finally collapees altogether, followed by a loud report and the evolution of large volumee of steam. From the facts elucidated hy his experimente, the author makee the euggeetion that the tracee of oil, or other organic matters which find their way into a steam boiler, may similarly produce a eudden generation of steam sufficient to account for certain problematical explosione.

The Constitution of Matter—Matter and Force but a Single Entity.

Matter, ae we conceive it, is inert, that ie to say, is unable to change of its own accord its condition of motion or of rest. Thst which ia capable of communicating a movement ie known as force.

There are several forcee of which wa hava knowledge—heat, light, electricity, magnetism, attraction of gravitation, life. For many centuries theee various forces were considered sa eo many distinct entities, but in our age it is understood that they are merely different manifestations of a single force. In fact, these forme are converted one into another with the greatest facility. When we heat an iron bar, it lengthens, mechanical action ie produced, heat is absorbed. If we could reduce the bar to its original size by compression, the me hanical work produced by the heat wontd be destroyed, but the hest sbsorbed would be set free. When we pass an electric curr nt of certain intensity through a fine copper wire, the wire becomee hot; and at the time the intensity of the current diminishes, electricity is converted into heat. The identity of light and radiating heat has, moreover, been distinctly demonstrated, as well as that of electricity and magnetism. It may be considered certain, tben that but a single force exists, msnifesting itself to us under different aepects according to circumstances.

At the time when the different manifestatione of force were thought to be so many distinct entities, the disappesrance of heat, of light, and of electricity could only be accounted for by assuming a total snuihilation of these agenciea. On the other hand, eiuce hest, light, and electricity are slwaye everywhere found in Nature, besides their possible annihilation, some were led to conjecture the possibility of their creation and to seek for perpetusl motion. We have passed this period of errors; mathematical calculation as well as experiment demonstrates that force can neither be created nor destroyed. A constant ever-living force exists in the universe, manifesting itself sometimes in oue way, sometimes in snother, but the sum of which is absolutely invariable.

Should we then preserve these two entities, force and matter, se having a distinct exietence? I think not. Force and matter: these are abstract ideae serving to assist our comprehension of that which exists nnder a two-fold aspect. Accordingly, then, we should admit hut one thing, matter endowed with motion.

All these forces with which we are acquainted are but the resultant of the motions of matter, and differ from one another only in the nature of this motion.

Finally, then, minnte indivisible particles or ultimates grouped in atoms, molecules, and tangible bodies, each endowed with motion capsble of being communicated from one to another without the possibility ot the quantity of matter or motion being increaeed or diminished—such we hold is the grandest conception of the universe.—*Naguet, in the American Chemist.*

FILIFORM SILVER ARTIFICIALLY PRODUCED.—Native silver occurs frequnently as metallic threads or wires twisted in every direction, and often bent at sharp angles. Specimens of this filiform silver were exhibited, from Kongsberg, in Norway, associated with calc spar, and from Chili, associated with greenstone, and it wss shown that the metal was tough and non-crystalline. Precisely eimilar threads of silver were produced under the microscope by decompoeing a solution of nitrate of eilver with suboxide of copper. The white filamente shoot forth in every direction, and twist about or double back in their course; while the cuprous oxide becomes black, splitting up, in fact, into cuprio oxide and cupric nitrate. Most of these threads are so fine that their dismeter is only one-twenty-five thousandth of an inch, snd a gramme of such silver wire would stretch from London to Brighton, and many are much finer still. Sometimes these filaments will end in crystalline knobs, or crystals of silver will form upon them, as is not unfrequently the case in mineralogical specimens. Attempts to prepare them by means of other snbetances than suboxide of copper had not proved successful; but, as that substance is by no means a rare mineral, it wae thought that their formation might result generally from its action on silver salts in solution.—*Dr. J. H. Gladstone.*

DISCOVERY IN MAGNETISM.—Paget'e recent discovery of new forms of permanent magnete is a matter of much interest to electriciane. It is well known that it is impoesible to magnetize a plate except in the direction of ite greatest length, and that a equare cannot be made to show the magnetic action at all. This new discovery, however, ehowe thst by cutting slits nearly up to the middle of a eteel plate, a square plate in one piece can, with euch slits, he regularly magnetized. By this means even an oblong square can be regularly magnitized, and with as many poles as may be required, in a direction transverse to ite greatest length.

PREVENTION OF EXPLOSION OF FULMINATES.—In the working of fulminate of mercury in the manufacture of peroussion caps, dangeroue explosions frequently take place. These may he to a great extent prevented, by granulating and mixing the fulminate in vacuo. A mixture of cyanide of copper and chlorate of potash may be eubstituted for fulminate of mercury.—*Ph. Neumann.*

NOTE.—†—California. *—Washoe. ‡White Pine. §—Ely District. ¶Eureka District. ‖—Idaho. ‖—Nearly.?—Over.

S. F. Stock and Exchange Board.

THURSDAY, November 7th, 1872.

The sales at the San Francisco Stock Board for the week ending Wednesday, October 30th, amounted to $2,361,000. Business in Mining Stocks hae begun to improve again, after a depression which has lasted eeveral weeks. Work hae beeu temporarily suspended on some of the Waehoe minee and mills, on account of a scarcity of wood aud timber, caused by the interruption of traffic on the Virginia & Truckee Railroad by the tunnel fire. This will soon be remedied and everything will go on as usual. The Raymoud & Ely mine has declared a dividend of $7 per share for this month, amounting to $210,000, but we have not heard from any of the Washoe mines as yet in this respect, although it is high time if promises are to be depended on. Against this dividend there are already nine asseements, viz: Alamo, Washoe, 25 cents; Schell Creek M. Co., Schell Creek, 10 cents; St. Patrick, Placer Co., Cal., $2; War Eagle, Idaho, $2; Star Consolidated, Eureka District, 25 cents; New York Consolidated, Washoe, 25 cents; Julia, Washoe, $2.50; Arkansas, Ely District, 50 cents; and Pioche, Ely District, $1.

On Friday the market was rather quiet, but Crown Point rose $3; Belcher, $4; Jacket, $3; Empire Mill fell $1; Caledonia, $2; Confidence, $1; Chollar, $5; Ophir, $3.

Saturday stocks were firmer, most kinds showing a elight improvement. From the highest ratee on Friday morning, Consolidated Virginia advanced $8; Alpha and Yellow Jacket each $4; Crown Point, $3; Chollar-Potosi, $2.50; Belcher and Hale & Norcross, each $2; Savage and Woodville each $1; Golden Chariot declined $2; Eureka, $1.50; Eureka Consolidated and Ophir each $1.

Monday Virginia Stocks were lively, the riee in Gould & Curry in particular being the feature; it sold $40 higher than on Saturday.

Tuesday being election day there was no session of the Board.

Wednesday the market was rather active, bnt pricee were irregular as compared with Monday; Belcher wae $1 higher; Chollar, $2; Ophir, $1; Yellow Jacket, $4; Gould & Curry, $3; Caledonia was $4 lower; Con. Virginia, $1; Empire and Imperial, each 50 cents; Savage, $4; Raymond & Ely fell $5; Pioche, $2; Meadow Valley, $1.

To-day, stocks were generally weak and pricee irregular. The pricee of the different deecriptione as compared with last week'e ealee will be seen by reference to onr Stock Tables.

Below are items of interest from prominent mines later than that in our "Mining Summary."

Crown Point.—The developments on the 1300-ft. level are excellent.

Chollar-Potosi.—Still prospecting with no new developments ae yet.

Belcher.—They have again commenced to ship ore to the river mills. The usual amount of ore is coming out and about 900 tons are on the dumps in addition to what has accumulated at the different mills. The assays run very high.

Hale & Norcross.—During week euding Nov. 2, 297 tons of ore were extracted; 379 tons sent to mills, and 1,456 remain on the dumps.

Raymond & Ely.—The total bullion shipments for October amounted to $344,411, equal to $11,110.03 per day. On November account $34,847 have been sent down, equivalent to $11,615.60 per day. The mines are looking well as usual, with a slight improvement in the west end of the Panaca.

Eureka.—A letter of the 2d inst. saye the clean-up, for the last eix day's run of 15 stamps, is 1,000 ounces of amalgam.

A good body of ore ie expected to be developed in the Buckeye shortly. From the Amador Tunnel some very rich ore is coming out. The vein in the second level of the Adams Hill is better than ever. Four of the Eureka Consolidated Company's furnaces are running. Splendid ore is coming out of the east stope of the American Flag; 200 tons of ore on dump. The Superintendent of the Huhn & Hunt sent down $8,269 in bullion on the 2d inst.

Mining Suit.—Charles F. McDermot has inetituted suit against the Raymond & Ely Mining Company and allegee that he is a tenant in common with the defendant aud owns 800 feet of 1,350 feet of the Raymoud & Ely Mine, and that the defendant hae excluded him and appropriated all the proceede of the mine amounting to upwards of $1,500,000. He aeke that an injunction be iesued to reetrain the Company from paying out dividende of its stock.

——* Advertised in this journal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Tarshish.—Alpine *Chronicle*, Oct. 26: Work has been resumed, and Mr. Hunter ie having the mine, mill, furnace, etc., examined by experts from Virginia.

Globe.—Work will be resumed on Monday next. A contract has beeu let for contiuuing the tunnel 100 ft. from its present face.

I. X. L.—The erection of the buildings for the hoieting works and carpeutere will be commenced on Monday.

AMADOR COUNTY.

Progressing.—Jackson *Ledger*, Nov. 2: The large new shaft on the Kennedy is progreesing fiuely. The workmen are down 20 odd ft. The Company intend running a tunnel iu to etrike the lead when they reach 100 ft. The mill is kept running day and night, and the ore is averaging about $22,000 per month.

CALAVERAS COUNTY.

Gwin Mine.—Calaveras *Chronicle*, Nov. 2: Last Saturday the regular, fortnightly, $10,000 clean-up was made.

INYO COUNTY.

Lida Valley.—Inyo *Independent*, Oct. 26: The Lida Belle shipped, during the past Summer, $43,000 in bullion—the proceeds of a 5 stamp mill, not in operation more than one fifth of the time. They have on the dumps at the mines $30,000 worth of secoud class ore, and have recently purchased the Washington Mill (au 8 stamper). Mr. Hickey calculates to have it in place by Dec. 1st.

To be Rebuilt.—Belshaw & Co. have a new engine and other machinery on theway to Cerro Gordo, to take the place of that in their furnace, a good portion of which is to be rebuilt and put in coudition for work.

KERN COUNTY.

Eclipse.—Havilah *Miner*, Oct. 26: This mine is turning out a large quautity of first quality rock. The mill is kept in constant operation; 22 miners are engaged.

Big Pump.—The big steam pump for the Joe Walker will arrive on the 10th of next month.

Big Blue Mine.—Rock of exceeding richness is being taken out in large quantitiee. The mills were etarted up last Wednesday and are doing their beet at a 150-ton dump of $45 rock.

Bacchus.—A run of $33 rock is being made at the mill of this mine; 50 tone of rock will be put through thie week.

Papoose.—The ledge has widened 2 ft. and now meaeures 5 ft. from wall to wall, with an immense body of rock in sight, valued at from $22 to $40 per ton.

NEVADA COUNTY.

The Situation.—G. V. *Union*, Nov. 3: The Iudependence tunnel is in 250 ft. The Dairy Hill shaft is down 280 ft. or 55 ft. below the second level. The shaft will be continued down 25 ft. further wheu the third level will be opened. Iu the bottom of the shaft the ledge is over a foot in thickness. In the north part of the second level there is a large ledge. In the south of the level the rock is very good, being capable of yielding by mill process about $60 per tou.

Reese Mine—On Randolph Flat is yielding well. The miue averagee about $50 to the pan.

The Idaho—Will etart up 35 etamps this week. There ie a great quautity of ore broken up iu the miue, ready to be sent to the surface.

In the Coe the shaft is to be put down to a much greater depth and thorough explorations are to be made.

The Sappho Co. have run a tnnnel from the Wolf creek side, into the hill 485 ft. The tuunel has cut a ledge which is over 3 ft. in thickness and which prospects well in free gold hy the use of a hand mortar.

Green Mountain—Will have its 5 stamp mill in operation this or next week.

The Knight of Malta—Is being prosecuted with energy. The ledge in the shaft is about 4 ft. wide and shows liberally in free gold and is heavy with sulphurets.

The Empire—Coutinues to send out rich ore. The batteriee and the plates at the mill indicates a good clean up.

The Eureka—Is being explored. A cross cut from the lowest part of the shaft has struck into a crevice of 3 ft. between walls and the crevice is filled with ledge matter.

Cunningham.—Nevada *Transcript*, Nov. 3: Tunnel completed 600 ft., aud ledge struck 80 ft. helow the old works. Since they struck the ledge they have taken out 17 tons of rock, which paid $25 per ton.

SAN DIEGO COUNTY.

Bullion.—San Diego *Union*, Oct 26: Bullion amounting to $3,000 was shipped on the steamer Pacific to S. F.

Owen's Mine.—Mr. DeFrees exhibited to us yesterday, 4 bars of bullion valued at $4,000, from Owen's rock.

TUOLUMNE COUNTY.

Putting up a Mill.—Sonora *Independent*, Nov. 2: The Vau Trump quartz claim, Fox Gulch, has been honded to a S. F. Co. for $6,000. A mill has been purchased and moved to the locality, near Summit Pass.

Excelsior.—Sonora *Democrat*, Nov. 2: Work on the adit tunnel is progressiug at the rate of 8 ft. per day, aud when completed will tap the old works at 210 ft. vertical depth and be 1,000 ft. long. The Co.'s new eteam mill will start up on Monday to crueh the ores taken ont in extending the adit level.

Nevada.

RAILROAD DIST.—Elko *Independent*, Oct. 26: The Last Chance looks well. Over 1,000 tons of good ors on dnmp.

The Ella is yieldiug 10 tons of 30 psr cent. copper ore per day.

The Shoo Fly Co. recently tapped their vein hy tunnel 130 ft. below the snrface. The ore is very rich and from 5 to 7 tons per day is being extracted.

The Bob Hnnter is being vigoronsly worked, and shows a fine hody of copper ore. The Hussey furnace fired np on Saturday to dry out.

EUREKA DISTRICT.

SILVER CONDOR.—Eureka *Sentinel*, Oct. 29: This shaft has hesn sunk 20 ft. and a very good hody of ors struck.

ELY DISTRICT.

REVIEW—BULLION.—Ely *Record*, Oct 27: The supply this week reaches $131,782.71.

MEADOW VALLEY.—Though the mill only commenced to run regularly on the 15th of this mouth, the product of hullion will reach $110,000 for Oct. At the Snmmit or No. 5 shaft sinking is progressing rapidly. From the workings connected with No. 3 shaft, much ore of a very high grade is being produced.

EXCELSIOR.—During the past week exceedingly rich ore has been takeu from a winze that is being sunk from the 150-ft. level in the easterly drift. The winze is down 80 ft. and reveals a strong, well-defined ledge, 3 ft. thick, all pay ore, with a streak of about 6 inches wide of decomposed chloride, which assays over $2,500. In the other parts of the mine stoping is going on in the upper and lower levels, and about 15 tone of ore are being raised and shipped daily. The returns of hullion from the Excelsior ore average about $12,000 weekly.

RAYMONN & ELY.—Connection has been made from the 523 ft.-level of the Lightner shaft with the vein. The shipments for the last 3 days of bullion reach $36,500.

HUHN & HUNT.—Two hundred tons of ore have heen eent to the Amorican Flag mill and 300 tons are on dump ready for shipment. At the mine a new shaft is being sunk and is 40 ft. deep from the level of the tuuuel. The ledge shows all the way down 2½ ft. in width with an oar streak of about 10 inches at the bottom. The upper etopes are open for about 200 ft. and show well. A winze haa heen sunk 123 ft. from the turn-table, from which drifting and stoping has boen commenced. Here the ore shows about 2 ft. in width, is rich and improving as depth is attained. One huudred ft. south of the turn-table a small ledge wae cut through last spriug, and at that time but very little was thought of it. A short time ago drifting was commenced. Twenty ft. was ruu and the ledge wideued. A winze was then sunk 5 ft. and the ledge opened 2 ft. in width, from which assays went as high as $525 to the ton.

NEWARK.—The main shaft is down 440 ft. A cut will be made to tap the ledge at the depth of 375 ft. The east drift in 40 ft., ehowe porphyry to the face where quartzite begine to show. The ledge matter shows at the opening of thia drift some 20 ft. in width. A drift has heen run 60 ft. in a westerly direction. A cut wae made in the south side of this drift, to connect with a winze that was started from the 225-ft. level. Fine ore shows where the winze cuts the main ledge. Some 15 tons have been extracted, and will be hoisted soon. In this westerly drift the pay ore varies from 4 to 12 inches. Stoping has been commenced at the opening of this drift.

ARKANSAS.—The incliue shaft hae reached 350 ft., with a strong vein of ore at the bottom. A station will be shortly opened at thie point, and levele commenced. In the 120-ft. and 250-ft. levels the veiu ie being etoped out. It is 3 ft. in width and will average large figures.

IVANHOE—The working shaft has reached a depth of 200 ft. Hoisting machinery for use in this shaft is on the way from S. F. In the old working a winze ie being eunk from the 300-ft. level of the incline, and shows a 3 ft. ledge.

PORTLAND.—The vein shows a large stratum of unusually rich ore.

PAGE & PANACA.—Sinking the main ehaft, which is down 470 ft. Laet week a ledge of soiue size wae passed through, but not bearing ore in any quantity. The 360-ft. level is 165 ft. from the shaft.

CHAPMAN.—A vertical shaft ie being sunk which ie 420 ft. deep. The 360-ft. level is looking favorably.

CHIEF OF THE HILL.—Laet week about $7,000 in bullion wae shipped making a total of $24,000 since crushing was commenced. The third level is in good ore at the face. The winzes being sunk from this level are developing ore of an excellent character.

SUNBEAM.—The hoistiug machinery ie working satisfactorily.

PORTLAND EAST EX.—The ehaft is down 40 ft., aud for the last 5 ft. has been in ledge matter, with flattering prospects.

AMADOR TUNNEL.—The winze is being ennk on the blind ledge cut by the tunnel. This hae attained a depth of about 50 ft., and shows ore throughout its depth. About 30 feet from the level of the tunnel, a station is being opened and a tunnel commenced.

HERMES.—The work of einking the vertical shaft is progressing rapidly. A depth of over 500 ft. has been attained.

PIOCHE PHENIX.—The newehaft has attained a depth of 125 ft., and is well and eecurely timbered in two compartments. Sinking is still progressing. In the old works the incline shaft ie 380 ft. deep and etill sinking.

CHIEF EAST.—A winze haa heen sunk from the drift which was run from the bottom of the inclins. This winze is 20 ft. deep, and at the bottom shows the ledge to be widening and carrying ors of su extremely high grade.

MAZEPPA.—Sinking on the incline, which frequently cnts ore seams. It is 90 ft. in depth. Hoisting works for this mine have been ordered at S. F.

THE PACIFIC TUNNEL has attained a total length of 1,020.

JOLLY TRAVELER.—The shaft is 120 ft. deep. At the bottom sevsral strata of ore are heing cnt.

MARION.—The drift from the bottom of the shaft is in ahout 75 ft. The shaft is 90 ft. in depth. The ledge shows well in the drift and the assays are improviug.

ORLEANS.—The incline is 180 ft. in depth, is bcing straightened and timbered.

REESE RIVER.

BELMONT. — Resse River *Reveille*, Oct. 26: COMBINATION has had reduesd 2 lots of fins ore from their Transylvania; first lot of 60 tons yielded $375 per ton, second of 18 tons yielded $450 per tou. Working 25 men.

BELMONT CO.— Continuing levels north and south, taking out some good ore from levels above water.

MONITOR CO. — After running lower level north 100 ft. from south incline cut across the vein towards foot-wall, drifted 15 ft. and cut through a 3-ft. veiu of very rich horn silver ore.

EL DORADO SOUTH CON. CO. — The large chimneys, hoth north and south, on the 340-ft. level looks better than ever. Same level ie being continued southerly through the ore hody. The new 400-ft. level is being pushed through spleudidly. In the Arizona a 2-ft. strata of chloride ore was cut into in the 2d level yesterday.

WASHOE.

LOCAL SUMMARY.—Gold Hill *News*, Nov. 2: IMPERIAL-EMPIRE.—A large force ie employed on the surface work for the new pumping machinery. The incline ie down 45 ft. below the 1700-ft. level, aud the einking makiug fair progress. The main south drift on the 1700-ft. level is making excellent headway, the face in soft porphyry. The maiu south drift on the 1600-ft. level is pushed steadily ahead, the face in a mixture of quartz and porphyry. The main drift on the 1500-ft. level is driven ahead, the face in porphyry and quartz.

HALE & NORCROSS. — Work is stopped for want of wood.

CON. VIRGINIA. — Surface work for the new machinery is almost suspended on account of a lack of timber, caused by the railroad blockade. The maiu west drift on the 1167-ft. level is pushed vigorously ahead, the face in porphyry. Prospecting the 500-ft. level is continued. Sinking the incline is making fair progress.

GOULD & CURRY.—The incline down 60 ft. below the 1600-ft. level is making good headway. The main east drift on the 1500-ft. level is in 353 ft., the face in porphyry. The east cross-cut from the eouth drift at the 10th station is in 60 feet, the face in porphyry and quartz. The main north drift at the 10th station is in 219 ft.

BUCKEYE.—A prospecting drift north from the first etation developed a new body of fine ore during tho week. The drift at the fourth etation is in 33 ft., and will have about 30 ft. more to run to reach the ledge. The mill was started up last Monday, working finely.

CALEDONIA.—The main west drift on the 400-ft. level of the new worke ie driven ahead, the face is a mixtnre of clay, quartz and porphyry. The uorth drift in the 400-ft. level ie pushed steadily. The prospecting drift eouth on the 300-ft. level of the old works is in 300 ft., the face in clay.

SAVAGE. — Daily yield 160 tons, worth $28 per ton. Sinking the incline ie making good headway. The ore-breasts on the 1500-ft. level are opening up finely, the ore gradually improving in quality. The chute at the 1600-ft. station is about complete, so that drifting ou that level can soon be prosecuted.

JULIA.—Sinking the ehaft is progreesing rapidly; it is down 200 ft. below the 800-ft. level. The main eaet drift is in 240 ft., being driven vigorously ahead. The machinery works splendidly.

SIERRA NEVADA.—The prospecting drifts on the 500-ft. level are pushed steadily ahead. The mill ie kept steadily ruuning on ore from the upper and middle portions of the old mine. The different ore-breaete are looking well.

WOODVILLE. — The fine body of ore shows better as further developed, and the yield of the mill ie satisfactory.

CROWN POINT.—The ore-breasts at the 1100 and 1200-ft. levels hold out wonderfully. The developmente at the 1300-ft. level are more promising than ever.

YELLOW JACKET. — As eoon as the water is drained out of the lower levels prospecting at that point will be resumed. Drifting and cross-cutting at the 1300-ft. level progresses.

SILVER HILL. — Both the north and south prospecting drifts at the first station are in ore, with a decided improvement in quality during the week.

CHOLLAR-POTOSI.—The main shaft ie repaired to the head of the incline. The surface work on the new machinery is completed. The daily yield has been iucreased to about 166 tone worth $29 per ton.

BELCHER.—Hoisting through the new incline and shaft progresses. The various ore stopee are looking and yielding finely.

OVERMAN.—The surface work for the new machinery ie completed.

INSURANCE.—The incline is down 20 ft., and the ledge gradually widening out, the full face of the incline ie in good ore.

OCCIDENTAL.—A new contract hes been let and the work of driving the main drift ahead to the northward, is being prosecnted with vigor.

KNICKERBOCKER. — Good progress is being made with the main west drift which is in 258 ft., cntting streaks of qnartz and clay.

UTAH.—All work is stopped for the present, it being impossibls to obtain the necessary snpply of wood.

CROWN POINT RAVINE.—Clsaning out and repairiug tho shaft is progressing finely.

WHITE PINE.

BULLION.—White Pine *News*, Oct. 26: The shipment dnring the past week, was $12,892.59.

TREASURE HILL MINES—EBERHARDT & AURORA MINES.—The Eberhardt and Blue Bell shafts connect with the Atwood shaft for ventilation, and are sinking to the depth for better ventilation in the Blue Bell shaft. In the Ridsdale and De Pass chambers the lower tunuel of the South Aurora is conuected with the North Ridsdale shaft, and are continuing ths drift to the North to connect the workings with the Lady's chamber at the North end of the North Aurora, and are still working in the sonth chamber from the Lady's chamber.

BEECHER CONS.—In the Beechsr works it is snpposed a hody of ore has heen struck.

O. H. TREASURE.—The various workinge are looking well. The Wheeler tunnel is being pushed ahead in spar and vein matter, which is dipping downward.

SUNBEAM.—Sinking in Moscow ehaft, and running a little to the south in quartz. The mine shows some improvement.

MAMMOTH.—The hottom of the shaft is looking well, and down about 55 ft. in good ore.

SILVER PLATE.—Running in tunnel, which ie over 50 ft. deep, in good ore.

NOONDAY.—Resumed work on the cross-cut in the lower tunnol.

EAST SHEBOYGAN.—Prospectiug and forming connection hetweeu the air shaft and South drift.

COPPER GLANCE.—A force is employed in getting out ore from the northwest drift and making connection with the north drift.

REVIEW.—Schell Creek *Prospect*, Oct. 26: The McMahon in the bottom of the shaft shows 6 ft. wide of ore which assays all the way from $100 to $1,400 to the ton.

Work ou the Tehama ie going ou lively, aud the mine is constantly improviug.

The mines in Ruby Hill, Centreville aud Queen Spriugs are looking as well as cau he expected.

Arizona.

MINES ANN MINING.—Prescott *Miner*, Oct. 9: At Lyux Creek the mines are doing well with workers.

AT ANTELOPE CREEK.—The parties ruuning arastras on the Marcus rock are getting, regularly, $100 to $110 per ton from quartz cruehed.

Mexicane are working the old Antelope placers, and several large chispas have been found recently; one weighing over 8 ouncee was taken out last week.

From the new diet., 30 miles south of Wallapai, we learn that the Gun-sight lode is creating a sensation.

Colorado.

BOULDER CO.—Colorado Springs *Out West*, Oct. 17: Logue & Burhage are working the Isabella, Carhon hill, with a 12-inch pay streak.

The Carbou tunnel is driven in over 200 ft., and 20 ft. ie made weekly.

Mr. Bottleson and others working the Sherman are down about 35 ft. and drifting each way.

The Carbon is turning out 20 tons of high grade ore every 24 hours.

CLEAR CREEK CO.—The proprietore of the Pelican have 900 tons of ore on hand awaiting treatment.

Iu the Cashier a 10-inch vein of mineral has been struck.

In the Ocean Wave, at the head of the tunnel which has been driven in 200 ft., a vein of mineral, seven inches wide, hae been etruck.

Idaho.

LOCAL RECORD.—*Owyhee Avalanche*, Oct. 19: EMPIRE.—The shaft ie now down for the 3d-level. They are waiting to get the drifte etarted in order to increase the yield of ore from 25 to 35 or 40 tone of ore per day. The 2d-level drifts are in ahout 140 feet each way.

FLINT.—Driving away on the Rising Star.

IDA ELLMORE.—The prospect of finding a rich deposit of ore from the 7th level np to perhaps the enrface is very encouragiug. The work of prospecting this ground ie being pushed ahead. The 8th level stopee are producing very rich ore, and in the winze now being sunk for the 9th level good ore ie also found.

MAHOGANY.—In the 5th level eouth, and also in the 6th level both north and south, the vein is from 14 inches to 2 ft. in width, and looks well throughout, especially in the 6th level. They have out over 200 tons, and will have 500 tons ready by the 25th inst., at which date they intend to commence crushing.

SOUTH CHARIOT—Has connected the shaft with the raise from the 6th level, and in a week or eo, the main shaft will be completed to the 6th level. Sinking will then be commenced for the 7th level.

SILVER CORD.—This mine is to be etarted up again.

PAUPER.—The new hoieting works are doing excellent work.

ILLINOIS CENTRAL.—The new ehaft is down 56 ft. at which depth they are running a level and etoping out the ore both north and eonth. The ledge is from 12 to 18 inches in width and richer than ever.

RED JACKET.—The adit levsl drift, is being pushed ahead rapidly, and shows a fine quality of ore.

GOLDEN CHARIOT.—The 5th level sonth is open for 200 ft. in length, and stopes ars being raised. Stoping is goiug on in the 8th and 9th levsls. The 9th level drift goiug sonth looks well.

RED MT.—Ars running the 100 ft. level north, where the ledge is from 1 to 2 ft. wide, with a prospect of paying well.

NOAFOLK.—Taking ont rich ore.

SOUTH MT.—Cor. same. The S. M. S. Co's furnace huildiug will be nearly completed this week.

The Independent is improving, being 5 ft. wide of good grade ore.

Montana.

CLEAN UP.—Deer Lodge *Independent*, Oct. 26:—Rodgers, Strickland & Collin's claim, Carpsnter gulch, cleaned up from 50 day's work for one man, with small head of watsr, $2,000 one day last week. The clean-up made 3 or 4 wseks ago amonnted to $4,000.

CARPENTER'S BAR.—The average run to the pipe has been about $100 per day.

TO BE REOPENED.—Helena *Herald*, Oct. 24:—The Helena Smelting Works will be put in operation on or abont Nov. 1et.

Utah.

BULLION —S. L. *Tribune*, Oct. 29:—Within the past few days 17 bars have been received from the Pioneer Mill, East Cañon. The bullion ie over 996 fine, some running as high as 999. The aggregate value of the 17 bars ie $33,511.

COTTONWOON SMELTERS.—The Germania Refining works are being rapidly pnehed to completiou. The Davenport Smeltere will be finished very soou. The Flagstaff Smelter is in full blast, aud turning out largo qnantities of bullion daily. The Saturn works at Sandy are buying a great amount of ore.

WINSOR CO.—This Co. is carrying on active operatione on property in Little Cottonwood, consisting of the Montezuma, Savage, Hiawatha and Last Chance Minee. The Savage from which ore is being taken yields from 9 to 11 tons of ore daily, aseaying from $100 to $300 per ton. A tunnel about 200 ft. in length is being ruu from the Savage to the Hiawatha and Last Chance and Montezuma mines. Another tunnel down the mountain haebeen commenced below the present Savage tnnnel, which will tap 4 lodes at a depth of about 600 ft.

DAY CANON.—The mine that attracte most attention here is the Mono. Incline ie down 260 ft., passing through ore the entire distance. There are 8 drifte run from the main incline, an equal number on either side, for a distance varying from 20 to 40 ft. The ore body variee from 2 to 6 ft. In the bottom of the incline there appeare to be from 5 to 6 ft. of solid mineral of a very high grade.

The Kearssge incline is down 360 ft. and there is an 8 ft. ledge commencing 150 ft. from the surface and running to the bottom of incline. There ie about 150 tons of ore on dnmp which will average $280 to the ton.

The Utah Queen incline is down 180 ft., ehowing a vein varying in size from 1 to 14 ft. The character of ore is Galena and Carbonate with an apparent showing of Chloride, and averages about $200 to the ton.

The Converee shows a very well formed vein averaging from 2½ to 3 ft. in thicknese.

The Wandering Jew incline is down 140 ft. The ore seeme to lie in pockete, the whole averaging perhape 20 inches. In the bottom of the incline there appears to be 1 ft. of mineral.

The Monntain Chief has an incline down 85 ft., and ehows a vein 4 ft. thick in placee, thongh considerably broken. In the bottom of the incline there is a good showing of mineral. This Co. have a tunnel run 45 ft.

The Tennessee Co. incline ie down 165 ft., and ehows a vein of mineral averaging about 16 inchee. The character of ore is galena, gray carbonate, chloride, and occasionally horn silver. The owners have taken out about 100 tons that averaged $300 to the ton.

OPHIR.—On the 4th of July there are 2 inclinee run, one to the depth of 230 ft., and the other about 300 ft. This Co. are working from 20 to 35 men.

The Chicago main incline ie down 200 ft. and well timbered. The vein which appears to be a fissure, varies from 2 to 6 ft. On the dump and in the ore house there are perhaps 500 tone of ore, which will average from 60 to 75 ounces of silver to the ton, and 60 per cent. lead.

The McCullom incline ehows mineral nearly the entire distance run—250 ft—thongh the vein appeare to be broken in placee.

The Velocipede Co. are talking abont putting up reduction works.

LITHOGRAPH. — We have received a very neat and handsome colored lithograph representing a 6-horse etage of the California and Oregon Stage Company, with a view of Monnt Shasta in the distance. The lithographieas well execnted a one ae we have ever seen, mnch reeembling a chromo, the figuree very life like and scenery magnificent.

MOAE RAIN.—We had a fine shower on Saturday, Oct. 26th, and another on Monday, Nov. 4th, snfficient to lay the dnst and clear the air beantifully; whilst they portend the usual November rains.

The Eureka (Grass Valley) Mine Report.

We have received the annual report of the Eureka Gold Mining Company for the fiscal year ending September 30th, 1872. From the Superintendent's report we condense the following summary: They have driven 881 feet of drifts, 644 feet of cross-cuts, sunk 223 feet of main shaft, and also sunk 105 feet of winze and run 363 feet of tunnel. The vertical depth of the main shaft is 961¼ feet, or 1,072 feet on the inclins. They have hoisted 9,925 tons of quartz, and crushed 9,730 tons in 293 running days, averaging 2.079 tons per day to each stamp. Of sulphurets 103 tons have been concentrated, 77 tons worked, and 30 tons remained on hand worth about $3,900. During the year 9,925 tons of quartz were extracted from the various levels of the mine. There were upwards of 4,000 tons of good pay ore in sight, that the Superintendent calculates will pay all ordinary expenses, for the further development of the mine for the next six months at least.

The expense of mining has been higher than usual, owing to quartz from the intermediate level, 2,839 tons, having to be handled twice, and also the stringers taken out on tribute. The milling has also been higher owing to the company not being able to keep more than 15 stamps running, requiring the same number of amalgamators and engineers as 30 stamps do. The Superintendent gives no decided opinion as to the future prospects of the mine.

The Secretary's Report shows the following items:

RECEIPTS.

Cash, Oct. 1, 1871	$ 25,867.90
Bullion	220,010.31
Construction	50.00
Sulphuret Reduction Works	4,872.24
Milling	150.00
Wood Ranch	1,068 00
Wood Account	6,072 13
Premium and Discounts	415.75
McDougal Works	771.13
Total	$259,277.46

DISBURSEMENTS.

Dividends	$ 20,000.00
Mining	101,864.91
Mining Account (Prospecting)	18,301.50
Milling	22,956.32
Sulphuret Reduction Works	4,663.24
Roumania Mine	8,617 50
Mobile Mine	3,274.16
Construction	8,885.00
Mine Purchase	6,008.50
Sulphuret Concentration	1,821.25
McDougal Works	612.00
Wood Ranch	1,018 25
General Expenses	5,705.69
Bullion Expenses	843.44
Discount	53.16
Cash Sept. 30, 1872	59,654.54
Total	$259,277.46

The assets are estimated at $150,599.31 of which the mill is calculated at $40,000, and the building and improvements at the mine, $30,000. There are no liabilities. The average value of the ore worked was $22.95 per ton, and the average yield of the sulphurets $127.22 per ton. Bullion from the mill was worth $17.56 per ounce, and that from the Chlorination works $19.74 per ounce. The cost of mining 9,175 tons was $101,184.07, or an average of $11.03 per ton. The cost of milling 9,730 tons was $22,856.32, or an average of $2.35 per ton. The cost of concentrating sulphurets was $17.68 per ton, and of reducing them $28.06 per ton. The net profits were $61,799.86 of which $20,000 was paid as dividends to stock holders; 8,835 for construction and 6,003.50 for the Mobile Mine.

From the formation of the Company, October 1st, 1865, to September 30th, 1872, the receipts were $3,606,265.91, of which $3,585,543.85 were from bullion taken out. Of the disbursements $1,714,000 was paid out as dividends; $1,381,614.79 for mining and milling expenses. $301,906.50 for titles to property etc., and $141,939.71 for construction. The net profits from Oct. 1st 1865, to Sept. 30th, 1872 were $2,224,651.12.

Efficiency of the Signal Corps.—The Signal Service Bureau predicted, several days before they occurred, the late frosts that have been so severe in the Northern States. The truth of the expression, "forewarned is forearmed," was verified in this instance, and those engaged in agricultural pursuits in the sections visited were prepared for the frost, and were materially benefitted by anticipating its approach. This is another proof of the benefits of scientific investigation applied to every day life. The "probabilities" proving correct much more frequently than the old rules and signs in the days when Virgil's Georgics were an authority. The farmers and merchants are principally interested in these investigations, but the results are none the less important to the general public.

Bidders for Our Smelting Ores.

The German smelting works are making offers for American ores and have established an agency in this country for that purpose, as will be seen by reference to our advertising columns. The works of these companies have combined those of Clausthal (Hartz), Freiberg (Saxony) and Eisleben (Mansfield), under the name of the Royal Smelting Works. The agent in New York, Mr. Henry Robertson, 149 Broadway, is authorized to receive and to realize on ores at these smelting works on owner's account, on every quality of ore. The actual contents, of silver, gold, lead or copper found by careful official assays, are paid for in conformity with the tariffs published by the works which, with the circulars, have been sent us. Cobalt, nickel, and zinc in the ore will be paid for according to special agreement. No commission is charged by the agent in New York, he being the official agent for the management of the business.

For silver they pay about as follows: 10 ounces to the ton 35 per cent. of its value; 20 ounces 62 per cent.; 30 ounces 75 per cent.; 100 ounces 90 per cent.; and for qualities over this a slightly increasing percentage. Of course no one would ship silver ore of less than 90 to 100 ounces, depending upon the presence or absence of lead, so that the offer is practically from 90 per cent. for 100 ounce ore up to 95 per cent. for 500 ounce ore; with an addition under usual circumstances of two per cent. for ores that contain more than one per cent. or 292 ounces. The payment for gold ranges from 80 per cent. for ores containing one-tenth ounce, to 92 per cent. for ores with 20 ounces. The tariff for lead and copper are based upon an average price of 5⅓ thalers for 100 German pounds, (about 3¼ cents on gold per English pound) for lead; and 25 thalers for 100 German pounds, (about 16¼ cents gold per English pound) for copper. In case the actual prices are higher the difference is paid extra.

These works possess excellent advantages for working ores, having borne a good reputation for many years, and although this is the first time that they have made any particular effort to obtain ores from this country they have always treated those sent to them in a satisfactory manner. Assays are made at the works by sworn and competent assayers free of cost. In case shipments are made from here or other ports shippers should forward shipping documents to the Agent in New York, and it is also desirable that a small sample of the ore should be sent to him in order to ascertain beforehand for which of the works the ore will be best suited for. The circular says that in most cases shipment by way of New York will prove the most practicable, especially as six or eight weeks from date of shipment from that port will be sufficient to get the returns there. We see no reason, however, why the ores could not be shipped from here as well as from New York if sent in any amount. This is a chance for owners of mines with smelting ores to have them satisfactorily worked with a certainty of correct returns.

Cotton Prospect.

The *Rural Alabamian*, for October, published at Mobile in the very midst of the cotton-growing districts, speaking of the present cotton prospect says: Whatever interested parties may say to the contrary, the cotton crop of the present season is destined to be a short one—far below the sanguine expectations of both producer and consumer two months ago. Prices, therefore, will in all probability, not only be maintained but materially advanced, as the evidences of greatly diminished supply manifest themselves. With this well-founded assurance before him, it behoves the provident planter to be fully up with his picking, and, further, to see that his crop is gathered in the very best condition. The difference in cost between carefully picking the crop and slovenly gathering it, as is getting to be too much the fashion, is comparatively little, while in the sale it makes all the difference between the highest price and the lowest. Every moment that cotton remains unpicked after it is fully open injures its commercial value by bleaching it and rendering its fibre more harsh and brittle. It also loses rapidly in weight, and thus entails a postive loss of income upon the purchaser. The crop once housed in good order, no great haste need be made in running it through the gin, for the longer cotton lies in bulk unginned and unbeated, the heavier, and richer in both look and feel, its fibre becomes. With the probabilities of a rising market before him, therefore, the planter, who is fortunate enough to own his crop after it is made, will do well to turn his chief attention to properly housing his crop first, and then, at a more leisure period, to the proper handling and marketing it.

Ice Works on Prosser Creek.

The new ice company on Prosser Creek, says the Truckee *Republican*, are progressing favorably with their enterprise and expect to be in complete readiness for storing ice by the first of December. Their works are located about 1200 feet above the mouth of Prosser creek. A splendid side track has been graded and laid from the railroad direct to the spot where they are erecting their ice house and all the timber, lumber and material used in its construction are freighted in on cars. We visited the locality yesterday, upon invitation of R. P. Moore, the general superintendent of the new ice company. We found a busy camp of over one hundred men employed in constructing the dam, the ice house and other buildings. The dam is being built of heavy timber, some 500 pieces from 25 to 50 feet long by 15 inches in diameter being required. When completed it will be 29 feet high and about 95 feet in length as it crosses the channel from bank to bank. The dam is built in a spot where the creek narrows into a cañon, and immediately above there is a broad flat. The water, when the pond is full, will flood a distance of 3,000 feet, and will overflow from twenty to twenty-five acres. In building the dam the ground is first excavated down to the bedrock and upon this the timbers are laid lengthwise. The flume to carry off the surplus water will be four feet square. A fish-way or ladder for the finny tribes will also be provided.

The main building has just been commenced. It is to be 450 feet long, 50 feet wide, and 24 feet high. Owing to the narrow cañon through which the creek runs all of the ground upon which the building is to stand, had to be excavated from the bank, and the building itself will be in the form of a semi-circle, conforming to the sinuosities of the stream. Besides the ice house, a boarding house 80 feet long by 20 feet wide is being erected. In the erection of the buildings, over 500,000 feet of lumber and 350,000 shingles will be used. The timbers for the ties and cross beams of the ice building are 55 feet in length, and 6 by 10 inches wide and are sawed and furnished by the Richardson Brothers, at Summit Valley.

The ice-house is built immediately below the dam, so that the ice when it is made, will slide directly from the pond into the building by its own gravity. This will obviate the expense of any hoisting machinery or extra handling of frozen liquid. The capacity of the building when finished is estimated at 10,000 tons, and they expect to be able to fill it from one freezing of the pond. Sixty white men and fifty Chinamen are now employed by the company, and they desire to procure about thirty more carpenters, in order to complete their improvements, if possible, within the next thirty days. It is claimed by those who have lived on Prosser creek, and kept a thermometer, that it is one of the coldest localities in the winter season in the Sierra Nevada mountains, and it is for this reason, as well as for its local advantages in being accessible to the railroad, that induced the company to engage in this enterprise. The foreman of the company in the erection of the dam is Seth Green. The principal owners, we understand, are W. E. Brown and B. B. Redding, of Sacramento. The ice business of Meadow Lake township, already large, will be increased fully one-third this coming winter over any previous year, and will probably aggregate not far from 25,000 tons. This is not only the great lumber-producing center for Nevada, Utah, and a portion of California, but it is the great ice-producing center for the Pacific Coast. And the demand for this article is not limited to this Coast only, but extends to the Sandwich Islands, and the principal towns and cities along the western coast of South America. This demand has but just begun, and is likely to increase for many years to come.

Eberhardt and Aurora. — The directors' and managers' reports and statement of accounts for the six months ending June, to be presented at the meeting on October 15, have just been issued to the shareholders. The profit realized at the mines amounted to £122 11d., and the general profit and loss account shows a credit balance to carry forward of £31,767 4d. The directors regret that, owing to the unprecedented severity of the winter, the strike of the miners, the time occupied in the conversion of the wet stamps, the defective wire-rope of the tramway, which greatly limited the quantity of rock conveyed to the International Mill, and the variable nature of the ore mined, the produce of bullion during this period has fallen short of their expectations. The sum standing as the total cost of the company's properties, including the White Pine Waterworks, amounts to £280,747 2d., as compared with £296,533 11s. 11d, in the previous balance-sheet—the difference—15,786 11s. 9d. being chiefly due to the terms of the settlement with the vendors, by which they surrendered 1,000 of the shares issued for the purchase of the White Pine Waterworks. The directors have confirmed the purchase for £1,600 of about four acres of mineral land, which it is believed will be a valuable acquisition to the company. Since the destruction of the International Mill, arrangements have been made for crushing the company's ore at the Big Smoky Mill, and the first week's return by telegram, received Sept. 30, reported that 130 tons had been crushed, averaging $56 per ton. The directors also anticipate being shortly able to communicate further arrangements with other mills in the district.—*London Mining Journal*, Oct. 5th.

Australian Tin.

Most encouraging accounts continue to be received from the various tin mines in the North. At Cope's Creek Maclean and party commenced sluicing two or three weeks ago, and the results are highly satisfactory; two bucketfuls of tin per day can be obtained by the labor of two men. Moses and party have now upwards of two tons of tin on hand; from 200 to 300 cwts of tin, it is stated, can be obtained by the labor of four men from top stuff; and from indications, they expect to meet with very rich deposits. At the Tyngarra Mine, in the same locality, six bucketfuls of tin of good quality were obtained on the 10th ult., by the labor of four men with one sluice. From nearly all the mines the reports received from day to day are of the most satisfactory character, and keep up the interest in mining speculations. In the New England district alone 17 Government surveyors are busily engaged in marking off land for tin mining companies. The Surveyor-General states that "a good deal of land has been taken up for tin and copper-mining (principally tin), extending over very large portions of country east and west of the main north road between Glen Innes and Tenterfield. The secretary of the Ellsmore Tin Company reports that the first crushing of the lode yielded 67 per cent. of tin, Mint assay. A very rich block of land on Vegetable Creek is being worked by Marshall and party, who hold a selection of 40 acres. The four men who are at work are able to raise 6 cwts. of tin per day, as the claim is very rich and close to a granite bar which stands below them, forming a catch where the creek narrows. Tin has become an important item of export both from Sydney and Brisbane. Most of the produce of our nothern mines finds its way to the latter port, where a portion is shipped direct to England, the balance to this market. Smelting works here on an extensive scale are projected, and a site has been obtained for the purpose close to the harbor. Last month's shipments to London were 479 ingots tin, 501 packages. Deposits of tin ore have been found at Barrow Creek in the Tumut district.—*Sydney Morning Herald, Aug.* 10.

Manufactures in the United States.

The ninth census furnishes interesting data showing the extent of manufacturers in the several States. There are 252,148 establishments, 40,090 steam-engines and 2,053,988 persons employed in manufacturing industries; the capital invested is set down at $2,118,247,069; wages paid annually $775,621,593. The value of manufactured product for the year ending June 1, 1870, was $4,232,625,892. The manufacturing interests are represented by the several States, as follows:

Alabama	$ 13,010,844	Missouri	$200,213,429
Arizona	185,410	Montana	2,494,511
Arkansas	4,629,234	Nebraska	5,738,512
California	66,594,556	Nevada	15,870,539
Colorado	2,852,820	New Hamps're.	71,038,249
Connecticut	161,085,474	New Jersey	169,237,722
Dakota	178,500	New Mexico	1,489,868
Delaware	18,791,382	New York	785,194,551
Dist. Columbia.	9,292,173	North Carolina.	1,921,327
Florida	4,685,403	Ohio	269,713,610
Georgia	331,196,116	Oregon	6,877,837
Idaho	1,047,625	Pennsylvania	712,178,941
Illinois	205,620,672	Rhode Island	111,418,354
Indiana	106,617,278	South Carolina.	983,498
Iowa	46,534,322	Tennessee	34,362,628
Kansas	11,775,823	Texas	11,517,302
Kentucky	54,625,809	Utah	2,343,019
Louisiana	24,161,905	Vermont	32,184,606
Maine	79,497,521	Virginia	38,354,322
Maryland	76,593,613	Washington T.	2,851,052
Massachusetts	553,912,568	West Virginia	24,118,051
Michigan	118,304,675	Wisconsin	77,214,326
Minnesota	23,110,700	Wyoming	755,424
Mississippi	8,154,758		

Experiments in Working Ores.—The Monitor *Miner* says that the experiments now being made both at the Tarshish and Monitor mills are of a highly interesting character, as calculated to set permanently at rest the question of raw amalgamation on our ores. The Tarshish folks have gone the right way to work, and will thoroughly test both plans before deciding on either. Mr. Huyck, the champion of roasting, has the inside track yet, and is very sure Mr. Hanson, Superintendent of the Yellow Jacket mill, and one of the best amalgamators by Washoe process in the State of Nevada, will find after a fair trial that his plan will not work on these ores. Mr. Hanson says our rich ores, like those coming out of the Silver Glance shaft now, should be roasted, but thinks the common grade can be worked up to 50 per cent. raw, and that it is the most profitable way. Mr. White, the foreman of the Monitor mill, pronounced first-class in raw amalgamation by Mr. Hanson, who has worked with him on Washoe ores, and also conversant practically with the amalgamation of roasted ores, is doubtful of Mr. Hanson's success, but anxious to see it tested, and willing to aid all in his power in a fair trial. Things are working, and donbt will be dispelled in one time.

Coal in Turkistan.—In Turkistan, Central Asia, near the Yusaf Pass, splendid coal deposits have been discovered. There are foundries at Kabul, and it is considered a most opportune event for their prosperity. Three hundred camel loads of the valuable article were transported from the coal fields to these works; and it is considered that the discovery will in many other ways add to the development of the material resources of the East. If the Turkistanese were a progressive people, which they are not, we might soon hear of some enterprising Yankee undertaking to build a narrow-guage railroad from the coal-beds to the Kabul foundries.

Useful Information.

Lime a Preserver of Wood.

Lime is likely to be used largely as a preserver of wood. It has lately been discovered that vessels which carry lime last much longer than others. For a block pavement it is said an application of lime can be successfully made. In frame-houses, the space between the lath and siding could be filled compactly with lime, and the usual decay prevented at no very large expense. In regard to lime in connection with ship timber, the experience of an old shipbuilder on the coast of Maine, published in the *Mechanics' Magazine*, is of interest. He had been in the habit of filling up the spaces between the timbers with hard stone lime, and ramming it in, calculating that slight leaks would cause the lime to expand and fill the crevices. Long observations led him to consider lime a good preservative. A coasting schooner, built of Maine timber, unseasoned, and loaded with lime, had gone ashore and hilged. Being raised and repaired, the schooner remained sound for thirty years, with exception of the wood that had been used in making the repairs. It had been noticed, also, that the vessels carrying cargoes of lime generally lasted longer than others. But the most striking case was that of a platform of pine planks, used to mix mortar on, and that had been employed by father, son, and grandson, and, being no longer needed, was suffered to remain on the ground and become overgrown with grass and weeds. After a period of sixty years, having occasion to use the ground, the planks were removed, and found to be as firm and hard as when first laid down.

A writer in the *Western Rural* makes the following statement. If true, it is a very important discovery

I discovered many years ago that wood could be made to last longer than iron in the ground, thought the process so simple and inexpensive that it is not worth while making any stir about it. I would as soon have poplar, basswood or quaking ash as any other kind of timber for fence posts. I have taken out basewood posts after having been set seven years, that were as sound when taken up as when first put in the ground. Time and weather seemed to have no effect on them. The posts can be prepared for less than two cents apiece.

For the benefit of others I will give the recipe: Take boiled linseed oil and stir in pulverized charcoal to the consistency of paint. Put a coat of this over the timber, and there is not a man that will live to see it rotten.

Chemistry of Honey.

A correspondent of the *Scientific American* says:—The chemical formula for honey is, carbon, 12, hydrogen, 14, oxygen, 14: for beeswax, C, 24, H, 34, O, 2.—Glucose, or grape sugar, is obtained from honey by treating it with alcohol. This sugar is employed in Europe for ordinary sweetening purposes, for confectionery, etc. But the abundance of cane sugar in this country makes its manufacture unprofitable.

Chemists have given us the foregoing formula for honey, but, when first gathered, honey partakes more or less of the essential properties of the plant from which it is gathered. This essence soon evaporates, if the honey be obtained from certain plants; while from others—buckwheat, for instance — the odor and taste is retained for a great length of time.

The crystallization of honey is an evidence of its purity; but many persons are more fastidious than wise about the food they eat. Honey in the comb is generally preferred, because of its beautiful appearance, and the impossibility of its being adulterated. Still wax is very indigestible, and pure, extracted honey is not only cheaper, but far more healthful and convenient to handle. There is a process for converting honey into wax, but owing to the large amount of honey required to produce a small quantity of wax, the manufacture is unprofitable.

Solomon's Temple in the Vienna Exhibition.—Francis Langer, a sculptor of Kaeden, but born at Weiport, began to cut the model of Solomon's Temple out of lime tree wood according to the details given by the historian, Josephus Flavius. For thirty years he worked unceasingly at this laborious work, and at length died in 1850 at the age of 72. His son continued the unfinished work until his death in 1858. Two citizens of Kaeden then took the matter in hand, and, partly by working at it themselves, and partly by getting others to follow the plans and details left behind by Langer, succeeded in perfecting it. The completed work takes up a space of 325 square feet; or, if in a square, a space 18 by 18 feet. The present owner applied to the director of the Vienna Exhibition as to whether they might exhibit it, and after some little delay, received a reply that space would be reserved for it. This result of their labor during so many years requires twenty-eight chests to pack it in, and will now be forwarded to the exhibition at Vienna.

Grease and Pearls.—Owners of pearl jewels should be careful to keep them from exposure to greasy surfaces, as contact of this kind destroys their lustre.

Patchouly.

It is well known that the real India shawl possesses a peculiar and agreeable odor, which was as new to European noses as the shawls themselves were to European eyes. The odor pertinaciously clung to the fabric, and a genuine "India" unfailingly advertised itself as such in its perfume. The cause of this odor was fully inquired into, and it was found to be given to the shawls by contact with a herb known to the Hindoos as putchapet or patchouly, as it is commonly spelled.

Importation of the dried herb, as an aid to the shawl-makers enterprise, naturally followed, and this led to its introduction as a perfume in Europe, and thence to our own country. Patchouly resembles our common garden sage, and is largely distilled in India. It comes to us in large, black wine bottles, holding the odd amount of twenty-one ounces, and is worth about $75 at wholesale rates, or $4 to $4.50 per ounce. The handkerchief essence known as "extract of patchouly" is simply a solution of the ottar in deodorized alcohol, a small proportion of ottar of rose being usually added, which materially improves the scent.

Genuine India shawls and India ink were formerly distinguished by their odor of patchouly; but since the perfume has become common in Europe the test does not hold good. Ill effects, such as loss of appetite and sleep, nervous attacks, etc., have been ascribed to the excessive employment of patchouly as a perfume.

A Good Idea.

The *American Chemist* has a notice of a new social safeguard in England, which promises to become a terror to evil-doers. To sand sugar and water milk are vile practices which—the latter especially—have been so laughed at as good jokes on city people that they have not received the punishment they deserve. The blue cow's tail, which is the pump handle, has figured in cities since milk was first dispensed; how much water might be put in was only limited by the scarcity of milk, the capacity of dealers and the patience of customers. But the much suffering English people are at last to be protected. Official chemists have been appointed by a recent law as public analyzers; they are empowered to examine suspected articles of sugar and milk, and, if they find them adulterated, to summon the persons who supplied them before the magistrate. For the first offense the penalty is a fine of $250; and for the second, imprisonment at hard labor for six months. In order to make this practical, any buyer who has been thus cheated may have the article analyzed on payment of a small fee, which will be returned to him and charged in the costs of court to the seller if the examiner's report is adverse. Such a law, if found of ready application abroad, should be enacted in this country. It can injure none but the fraudulent seller; and the abolition of "sky-blue" would insure comfort, soothe ruffled tempers, and make happy and thriving babies.

Autumn Leaves.—Who does not admire the forests in autumn? What a glory of gold, and crimson and richest brown the leaves present! The cool autumn mornings seem warm as we look upon their brilliant colors. Many persons think that all the brilliancy is the work of the frost, while the fact is we have the finest coloring in those seasons in which the frost holds off the longest. The appearance of the color shows that the leaves are ripe. They have finished their work and are just ready to pass in to decay, just as the ripeness of fruit is the first step toward decay. The dying leaves are so beautiful that many gather them in that they will retain their brilliant colors, and are disappointed in finding them turn in a few days to a dull brown. The colors can be preserved, but to do this you must arrest the process of decay, and this can only be done by drying as rapidly as possible. As soon as the leaves are gathered, place them between perfectly dry papers, old newspapers will do, and change the papers every day until the leaves are quite dry, which will be known by their becoming brittle. When the leaves are dry keep them between papers until you wish to use them for making wreaths and other decorations. To make the colors come out more brilliantly, the upper surface of the leaf should be lightly brushed over with boiled linseed-oil. The leaves may then be pasted or glued upon card-board to make wreaths or lamp-shades, or used in any other way that fancy may suggest.

Fishes' Eyes.—The eye in the lancelet and the hag is of the simplest form, consisting of a nerve termination coated with black pigment and capable only of perceiving the presence of light. In young lampreys, while they remain buried in the sand, the eyes are very minute and undeveloped; but when they reach the adult period these organs are developed to an average size. In the majority of fishes the eyes are admirably adapted to the purposes of vision in water, and in the four-eyed fish of South America not only are the eyes very perfect, but they are also divided into an upper and lower portion, giving them the appearance of two pupils and enabling the fish to pursue its prey when out of as well as when under the water. In the cat fishes the greatest variety is found in the size and arrangement of the visual organs, from the large eyes on the sides to minute ones placed on the upper surface of the head. In some of the members of this family they are so buried under the skin or incased in folds of cartilage as to be of little or no use.

Good Health.

A Ferocious Parasite Taken From a Man's Leg.

A short time ago a sailor went to the City Hospital from the British bark "Georgiana," who was supposed to be suffering from a sore leg. The men had been ailing for near three months, but none of his shipmates supposed there was anything serious the matter with him. Accordingly, when a few days before his removal to the Hospital, he declared himself unable to walk about, the Captain of the ship supposed that he was endeavoring to make an excuse for getting away from the vessel that he might be left in port, the ship being prepared to sail in a few days. When removed to the Hospital, the man's right leg was very much swollen, and manifested all the symptoms of erysipelas, for which malady his affection was at first mistaken. At the end of a few days however, an abcess formed upon the inner side of the ankle, from which, after it had burst, protruded about three inches of a white membranous-looking substance, about an eighth of an inch in diameter. This singular manifestation induced a careful examination of the leg, which developed the fact that the man was afflicted with *dracunculus*, or Guinea worm. This is a horrible parasite, found only along the shores of the Indian Ocean, Red Sea and certain portions of the Mediterranean. It infests damp and muddy soils, and impure water, and generally attacks the feet and legs, but sometimes other portions of the body. At the time that it forsakes its native element for the more luxurious habitations of flesh and blood, it is scarcely larger than a common flea; but having once buried itself beneath the skin, it grows with alarming rapidity, and will attain a size varying from six inches to six feet in length by one-twelfth to one-eighth of an inch in diameter. It lies dormant until it reaches the age of maturity, after which it commences a series of wanderings and meanderings about the muscles and bones which cause intense pain to the unsuspecting victim. It always travels downward, and with such rapidity that it will sometimes travel the whole length of the human frame in twenty-four hours. It will sometimes come to the surface and lie under the skin like a long white cord; but should the surgeon attempt to extract it with the knife without first securing it with a nipper, it will elude his grasp and scamper away with the agility of an eel. If a portion of the worm is removed the remaining portion will not die, but continue as gay and lively as ever. The first symptoms of the Guinea worm are a disagreeable itching and irritation of the infected parts. After it begins to move about, its paths are followed by external abcesses, and when the paths be along the stomach, internal abcesses also. It always ultimately endeavors to leave the system by working its way through the skin, generally near the ankle, but this is only after it has left from ten to fifteen young behind. The usual number of worms that is found in one person varies from one to fifty. There is one case on record, however, of a man dying from the effects of the Guinea worm, whose body and skin were nothing but a network of these horrible creatures. Death rarely results from the ravages of this worm, and when it does it is generally the result of some disease produced by the inflammation and other effects of the worm's wanderings. The Guinea worm does not confine its ravages to man, but will also attack dogs and horses. The sailor in question made a voyage to the eastern coast of Africa, about six months ago, and while there received the parasites into his system. One of these worms has already been extracted from his right leg, but another has made its appearance in the left. He is doing as well as can be expected under the circumstances. This is probably the first case of the kind ever known in Charleston.—*Charleston News.*

Our Food.

There is no country where there is so much dyspepsia as in America, because our people pay so little attention to food, and eat too much meat for the exercise they take. If one has mental labor, fish every second day at least is requisite. Soup sets all the glands at work, and prepares the stomach for the more important functions of digestion, and therefore should be taken at dinner every day. Beef broth is to the old what milk is to the young. Cookery properly attended keeps a man in health. If the stomach is out of order, the brain is affected. We should eat more fruit, vegetables, soup and fish. Good and well-prepared food beautifies the physique, the same as good and well-directed education beautifies the mind. Wrinkles are produced by want of the variety of food. The men who does not use his brain to select and prepare his food is not above the brutes, which take it in the raw state.—*Home and Health.*

Iodine and Boils.—As soon as a boil becomes hard and inflamed, paint it with iodine. The poison will not be scattered, but will be absorbed by it.

Popular Physiology.

Much importance has been justly attached to the subject of temperament, both as respects the training of children and the education of adults, and the selection of companions for life in the matrimonial relation. Respecting physical and mental training there is much error, not only in our system of common-school education, but also in vocations and habits of life. Children who are weak in body often take precociously to books, and the early indications of mental talent are often treated with a forcing or hot-house culture, to the utter ruin of the bodily constitution; while children who manifest vigorous muscles are put to the excercises or business pursuits which aggravate the disproportion between mind and body, and produce an adult with a strong body and imbecile mind. The proper application of the doctrine of temperaments reverses this custom. The feebler parts of the organism should be most assiduously trained. A harmonious organization should always be aimed at in the rearing of children and education of youth. There will always be unbalanced conditions enough; and when the child has attained the vigorous development of full-rounded manhood or womanhood, there will be time enough to cultivate special talents. In this manner only can genius be placed on an enduring basis, and extraordinary original capacity be rendered safe to its possessor and most useful to mankind.

In the selection of conjugal partners, some authors advocate the rule of similarity, and others that of diversity of temperaments; and it has been most absurdly pretended by some writers on human temperaments that two perfectly harmonious temperements are constitutionally incompatible, indeed, "physiologically incestuous." The teachings of nature, however, as manifested in the history of all the races of men, and as illustrated throughout the whole animal kingdom, are not difficult to understand. *From the Science of Health.*

How Royalty Sleeps.—It is now commonly believed that where two persons sleep together, one abstracts from the other some amount of vital force. This is especially the case where old and young persons share the same bed. Besides, in a room where there is no decided current of air, the emanations from the lungs and skin of a sleeper poison the atmosphere for a considerable distance. In the public wells of great hospitals, never less than two and a half feet is allowed between each bed for this reason. In the sleeping apartments of royalty and nobility single beds are everywhere the rule, and nowhere the exception. The Emperor of Germany sleeps upon a narrow bed and a hard mattress. The single bed covering is a wadded silk quilt. The Emperor and Empress of Austria take their royal slumbers on similar beds, with the same description of coverlet. One of the principal advantages of these narrow beds is that the mattresses are more easily aired.—*Galaxy.*

Treatment of Asthma.—George Gaskoin, surgeon to British Hospital for Diseases of the Skin, has had success in treating this disease by rubbing briskly into the chest, for the space of an hour, a chloroform liniment. The counter-irritation produced by the liniment was of benefit, but this benefit was increased by the jolting resulting from the rubbing. Anything that leads to the displacement of the air stagnant in the vesicles has proved able to relieve in many instances. It is advised that the friction be made with as much roughness as the case admits. Slight blows with the palm of the hand or the end of a towel on the ribs are quite allowable; and the friction should be extended to the front of the neck at the lower part, where the vagi enter the chest. The composition of the liniment need not trouble us, provided it be warm and work well.—*British Med. Jour.*

Dreams.—The following are medical signs of dreams, as published in a medical work:—Lively dreams are, in general, a sign of nervous action. Soft dreams, a sign of slight irritation of the brain; often, in nervous fever, announcing the approach of a favorable crisis. Frightful dreams are a sign of determination of blood to the head. Dreams about blood and red objects are signs of inflammatory conditions. Dreams about rain and water are often signs of diseased mucous membranes and dropsy. Dreams of distorted forms are frequently a sign of abdominal obstructions and disorders of the liver. Dreams in which the patient sees any special part of the body suffering, indicates disease in that part. Dreams about death often precede apoplexy, which is connected with determination of blood to the chest.

Home Comforts and Health.—A neat, clean, fresh-aired, sweet, cheerful, well-arranged house exerts a moral influence over its inmates and makes the members of a family peaceable and considerate of each other's feelings and happiness. The connection is obvious between the state of mind thus produced and respect for others, and for those higher duties and obligations which no laws can enforce. On the contrary, a filthy, squalid, noxious dwelling, in which none of the decencies of life are observed, contributes to make its inhabitants selfish, sensual, and regardless of the feelings of others; and constant indulgence of such practice renders them reckless and brutal,

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

OUR EUROPEAN AGENCY.—Frederick Brash, 21 South Grove East, Mildmay Park, London, is our general agent. Subscription £1 3s. 9d. for 12 months, or 12s. for six months, including postage. Friends at home and abroad will favor us by mentioning this agency to Europeans who would be interested in receiving this paper.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, Nov. 7th, 1872.—Legal Tenders buying, 88⅝; selling, 89. Gold in New York to-day, 112¾.

Table of Contents.

ILLUSTRATIONS.—D. O. Gilman, President of the University of California, 289. A Miner's Safety Candlestick, 296.

EDITORIALS.—Variations of the Needle; Academy of Sciences, 289. Commercial Reporting; Advance in the Price of Metals, 290. Bidders for Our Smelting Ores, 294. The Horse Disease, 296. Inaugural Address of President Gilman, of the University of California, 297.

MECHANICAL PROGRESS.—Imperfect Constructive Materials; An Invention Wanted; New Process of Combining Iron and Steel; Marbleizing Slate, 291.

SCIENTIFIC PROGRESS.—Zoellner's Theory of Terrestrial Magnetism; Phenomena of the Spheroidal State of Liquids; The Constitution of Matter—Matter and Force but a Single Entity; Filiform Silver Artificially Produced; Discovery in Magnetism; Prevention of Explosion of Fulminates, 291.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho, Montana, and Utah; Mining Shareholders' Directory, 292-3. Market Reports, 300.

USEFUL INFORMATION.—Lime A Preserver of Wood; Chemistry of Honey; Solomon's Temple in the Vienna Exhibition; Patchouly; A Good Idea; Autumn leaves; Fishes' Eyes, 295.

GOOD HEALTH.—A Ferocious Parasite Taken From a Man's Leg; Our Food; Popular Physiology; How Royalty Sleeps; Treatment of Asthma; Dreame; Home Comforts and Health, 295.

MISCELLANEOUS.—Inventions Needed; Diamonds in New York; From the San Feliciano Mines; Hayden's Yellowstone Expedition; Extent of American Peat Fields; Chemical Laboratories in Japan, 296. The Eureka (Grass Valley) Mine Report; Efficiency of the Signal Corps; Cotton Prospect; Ice Works on Prosser Creek; Eberhardt and Aurora; Australian Tin; Manufactures in the United States; Experiments in Working Ores; Coal in Turkistan, 294. The River Nile; The Cotton Plantations; Increased Consumption of Sugar; Result of England's Coal Famine; A New Enterprise; The Andes on a Decline, 298.

Inaugural Ceremonies at Oakland.

The inangural ceremonies connected with the inatallation of Prof. Gilman as Prest. of the State Univeraity, took place in Oakland, on Thnrsday laet, and the occasion will long he remembered as one marking an important era in the history of the University. President Gilman reached the Broadway Station ou the 10 o'clock train from thia city, where he waa met by the Board of Regents, the Faculty of the College and the Alumni of the University, who moved in procession, escorted hy the batallion of University Cadets and a band of music, to the Congregational Church, which waa soon filled by a large and appreciative audience.

Tho services consisted of an address of welcome by Nathan Newmark, of the Senior Claee; an address on behalf of the Academic Senate of the Univeraity, by the retiring President, Durant; an address, on behalf of the Regenta of the University, by the Preeident of the Day, Hon. Edward Tompkins; and closed with the inangural address of President Gilman, which we give entire in the present isaue. The addressess were all moat happy in tbeir character, and in the manner of delivery, and we regret our inability to give them all.

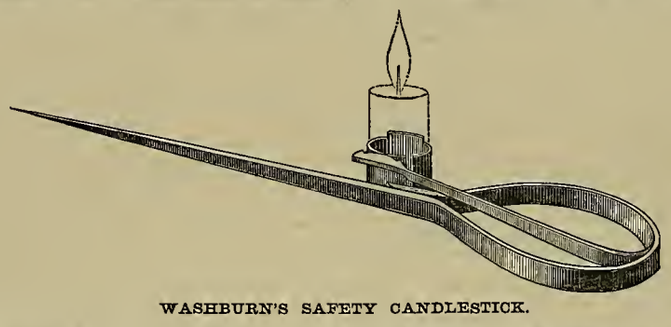
MINT MATTERS.—The coinage at the San Francisco Branch Mint for Octoher was as follows: Donhle eaglee, $1,800,000; eagles, $50,000; half eagles, $45,000; total, $1,895,000.

A Miner's Safety Candlestick.

The improvement in miners' candlesticke shown in the accompanying repreeentation is one, the importance of which will he readily recognized hy tbose familiar with mining operatione. It is specially adapted for the common candlesticks need in minee on thie Coast, which are secnred to the wall hy a apear attacbmeut which is stabhed into the wall, or timber of the mine and consists of an attachment for extinguishing the light when the candle has hurned down to the socket. As will be seen by the cut, a flat eteel spring is secured to the candlestick at a oonvenient distance from the socket, while its opposite end extends to the npper end of the socket, and has a sharpened blade or plate which lies across the eocket.

This hlade is semi-circulars to correspond with the ehape of the socket and leaves no projecting pointe. The edge of the hlade is not sharpened so as to cut into the candle nor is the strength of the spring sufficient to force it into the candle when in use.

To insert a candle tbe blade or plate is drawn hack hy hinding the spring until the socket is uncovered. The candle is then inserted, and the edge of the plate allowed to press against the candle just above tbe socket. Tbe blade, or plate, will remain in this position until the candle burns almost to it, but when the candle has burned low enough to cause the heat to soften the tallow agaiust which the blade presses, the spring will gradually force the blade across the socket and extinguish the flame. After the blade hae commenced to pass across the candle sufficient time will elapse before the flame is extiuguished to allow another candle to be lighted from it hefore it is extinguished.



WASHBURN'S SAFETY CANDLESTICK.

Thia simple and convenient little device ia the invention of Theodore A. Washhurn, of Gold Hill, Nevada, who has taken steps to patent hia invention through the SCIENTIFIC PRESS Patent Agency. By ita use fires can he prevented in minea, where the candle often burns down and then drops throngh the socket in a burning condition upon some inflammahle suhstance. In many of the large mines are piles of tallow in certain apots in the drifts and levela where lighta are always kept burning, and numerous instances are on record where a conflagration haa ensued from a ehort end of candle with wick falling on to the tallow and igniting the timhers. It was only a few weeks since that one of the Comstock mines was accidentally set on fire hy thia means, and hut for prompt measures seriousresults might have occurred. The meana employed to extinguish the light in this instance are effective, and have the additional merit of simplicity, while the whole device will probably cost very little more than the ordinary caudlestick, althongh it has douhle the value in partially insuring against fire.

COAL DISCOVERY.—There seems to be more foundation to the report of the discovery of coal, at San Rafael, Marin County, than was at first supposed. The ledge waa struck on a hill out of town while blasting rock. A dispatch statea that work has been commenced in the new mine, and the vein haa increased so that a large amount of coal has been taken out and is heing used in fnrnaces. There has aleo been discovered several new veins running toward the main ledge which average two inches in width. The experts who have examined the mine say that the indications are of a large and valnahle deposit of mineral coal. Lumps weighing ae heavy aa 100 pounds have been blasted out.

SILVER IN KANSAS.—An excitement exists in Lum County, Kaneaa, over the reported discovery of rich silver lodes in that neighborhood. A ehaft 140 feet deep has been sunk in one place bnt with what results ie unknown except to owners of the property.

The Horse Disease.

At the last meeting of the Academy of Sciences, Dr. Arthur B. Stout read a paper on the snbject of the horee disease now prevailing in the Eaetern States, whioh will he read with interest in view of the wonderful spread of the disease, and the probability of its reaching ns here. The subject caused an interesting discussion among the membere in which Dr. Gibbons deecribed a remarkable epidemic in tbe form of catarrh, which broke out among the hnman family in the year 1831, spreading throughout Europe and invading the Eastern States. It proved to he the forerunner ot a terrible visitation of cholera. He believed from paet experience that the preeent horse epidemic wae the first of a seriee of epidemics that wonld attack the hrute creation and poseihly extend to the human species. Dr. Stont's paper read as follows:

The possibility that the "horse disease" now prevailing in the Eastern and Western States may reach California, rendere it a eubject worthy of earnest stndy. It ie probable, or at leaat greatly to be hoped that the elevated and cold barrier of the Sierrae may interrupt and prevent its passage across tbe Rocky Mountains. Even if it ahould uot, the original germ elements of its existence may as well he generated primarily, if climatic influences favor their production on this, as on that side of the mountains.

It may then prove a public benefit to throw what light we can on this malady as far in advance as possible of its invasion. Being thus armed in advance with information every horse owner in the State may be prepared to act ae his own Veterinary Surgeon.

We may premise by saying that the usual appliancee of veterinary surgeone will not succeed. The nature of the malady is that of an intermittent fever dieposed to assume a typhoid type. The naeal catarrh, the throat disease, and the congeetion of the lunga wbich appear with more or less acnteneea are only aecondary affectiona, and ahate so aoon as tbe primary fever, and brain disorder are controlled. Hence it is that purgativea, drenches, sweata, bliatere, and clystera if relied npon alone aesist the malady hy promoting debility. Whatever debilitates the animal will favor the disease—because the diaease itself is one of debility caused hy the poisoning of the blood throngh malarioue influence. Thia poison prostratea the power of the hrain and corrupta the blood; nervous fever results, and the animal requires support rather than debilitating agents.

The Symptoms of the Disease

As yet obtained are very vaguely described, hut the one symptom, that of the coldneas of the legs and eara is almost sufficient to define the malady. No journals have aa yet given a clear account of the general symptoma. When the air containing the germ poison which the horae hreathee, comes in contact with the lining membrane of the noee, mouth and throat it is quite natural that enough of those poison particles should attach themeelvea to these membranes, on the way to the lnngs, and excite inflammation with discharge of matter, firstly thin and clear, and afterwarda thick and yellow; if they have activity enough so to excite a local inflammation, how much more eerioua muet he their energy when absorbed throngh tbe lunge, iuto the blood and thence transmitted to the hrain.

While then it may be very well to make some local application to tbe noee and throat, to aoothe that irritation, aud empty the digestive organs of the horse by mild purgation, tbe object of the cure can only he affected by counteracting the influence of the poison on the hlood and hrain. Thia fairly attained the local catarrhs will rapidly ahate. The fatality of the disease will depend upon the degree of intoxication (empoisonment) and the celerity with which remedies are applied in ita earliest appearance.

The Fatality of the Throat Affections

Is less to be feared, for it dependa upon the neglect to relieve the primary malady. The inflammation in the narrow passage to the lungs hecomes dangerons, by superceding the primary in acutenees, aud then kills by direct suffocation, or strangulation, rather than hy the malarious influence on the hlood and hrain The rational and

Natural Treatments

To be derived from these viewa, is to apply the same remediee to the horee aa would he reaorted to for the human heing. Due allowance heing made for the comparative differencee hetween man and the horae, the same treatment whicb is known to counteract malarione disease in the former, will also cure the latter. It is not asserted that all climatic germ-poiaons are identical, but that they are eo nearly allied in their action on living beinge that modifications of the same general treatment will enffice to control them all. The eame accuracy of doeage cannot he obtained for the horee ae may he attained for man, hecauee the animal cannot define his sensatione, and the preecribers, horse-owners and farmers are novicee in the art of medication. They cannot eetimate the differences dependent upon age, strength, sex and the degree of acuteness of the malady. On such discriminatione tbe animal must take his chance.

Being eatisfied of the identity of the diseaee with that of the human subject and the similarity of treatment, the next question would he tbe dosage or the comparative qnantity of the remedy. If tbie were estimated by the ratio of hulk and weight, the relative dose would be from 5 to 8 times greater for the horse than the man. But the organ to be acted upon is the brain, whioh in the horee heare no snch proportion to that of man. Again, the simplicity and uniformity of food and habits of tbe horse, would render his nervous syetem much more impressionable to active therapeutic agents. The same would be true of the other functional organe of the animal. A safe inference would he the eame; or at tbe utmoet douhle doses wonld amply suffice.

Horse Disease in California.

Horse disease is no new thing in California. It hae existed witb more or lese intensity for years. The cbicken disease may be mentioned in the same category, and doubtless ie referable to the same climatic conditions. How often have we heard of four or five horses dying within a few days in the same stahle, and suepicions heen excited that the water had been poisoned, or some foul play heen practiced. Sometimes two or three horses, where there wae no imputation of over driving or abuse, have died iu a night, especially where the horses have been kept in hasement etalle, and where the access of pure air wae defective. These horees were in truth the victime of malarioue infection, hut unfortunately tbie truth was not recognized.

The Rinderpest of Germany is another illustration of a similar infection, only ite intensity wae felt by the horned cattle. If then the horse disease appears as a general epidemic in California, eome cautious reserve may well be exercised before the disease is pronounced to be an importation from the Eastern States, for it is certain that it may exist from local climatic cause, and not necesearily he the result of propagation hy contagion, or by the diffusion of an onward march from State to State.

The Cure.

The sbeet-anchor of treatment ie Quinine; to it all other remediee are only auxiliariee. This should he at once administered without waiting for other prelimiuary treatment. The best moment to give the aulph quinine, if the prescriber is capable to judge, is in the cold stage of the fever, or when itis at its loweat temperature, as indicated hy the coldnesa of the legs and eara. Fifteen to thirty grains at the dose every tbree hours—continued for 24 or 48 hours—according to the aeverity of the attack. During tbia time a mild purgative of jalap, gnyac and glauherealt may he of service. Let the animal he well hlanketed to promote perspiration, and fed with warm maeb.

Tbe catarrh will be relieved by a local application of infusion of golden seal (hydrastus) in which a few drops of carbolic acid, dissolved in a teaspoonful of spirit of wine or whiekey, have been mixed. This remedy ehould he injected into the nostrils with a eyringe having a long beak. In this way it will not only hathe the naeal membrane, but will reach the throat. Some of it will aleo he swallowed, which serves a good purpoee in cleansing the atomach. In thia mixture the quinine may be dissolved and be poured from a hottle down the horse's throat, serving tberehy at the eame time the purpose of a throat wash. A wineglaseful of the infneion of golden seal will suffice for each nostril. If the fever is high the shoes should be taken off and warm poultices of flaxeeed meal be applied to the feet and fetlocks.

The Hygiene of the Stable

Ie a subject of the ntmost importance. A bad and dirty stable ie of itself enough to engender the disease, so tbat any falee economy in this respect may lead to very expensive results.

All sick horses should be forthwith removed from hasement stalls. Free ventilation to free the stable from ammoniacal and nrinary odora is indispensahle. Probably the hest disinfectant, hecause not poisonous, and very efficient, ie the hromochloralum, which should he frequently sprinkled from a watering pot through the atalla and passages. A pint to a hucketful of water anfficea. The addition of carbolic acid (¼ oz. to the eame measure) may he advantageonsly added. The hromochloralum, may be ohtained as well aa the golden seal infnsion at Steele & Co.'a drug store.

This disinfectant, freely aprinkled iuto tbe manure-pit, will not injure the fertilizing properties of that subatance; bnt here chloride of lime may alao enter. But if chloride of lime is too freely used in the atable, the chlorine set at liherty will make tbe horses oough and increaae tbe nasal catarrh.

Before closing, we venture the inquiry—May not the glanders (farcin) be closely allied to the malarione contagione, and, althongh the glandera is always considered an incurable, fatal diease, might not this eame treatment prove that this disease may likewise be cured?

The Building of the University.

An Inaugural Discourse, Delivered at Oakland, November 7, 1872.

[By DANIEL C. GILMAN, President of the University of California.]

Grateful for the kindness with which I have been met, and full of hope for the future which opens before us, I accept the trust now put upon me, imploring for the University of California the generous support of all good men within this commonwealth and seeking the divine blessing upon our united efforts for the advancement of knowledge, the formation of science, and the furtherance of the welfare of our fellow men.

It is an academic usage, in our land at least, that on occasions like this the incoming officer should give utterance to his views upon the higher education, and the usage cannot well be disregarded when one who is almost a stranger first enters a community of experienced teachers and aspiring scholars like this which is here assembled. My theme will therefore be the Building of the University.

The Building Elsewhere.

Since the University of California was organized it has happened that several of the leading colleges of the country have witnessed ceremonies like that in which we are now engaged, and so there have been ample and fresh discussions of some of the questions which most interest us.

At Cambridge, New Haven and Princeton, those historic seats of learning where traditions and usages both help and fetter, at Ithaca, Ann Arbor, Minneapolis and St. Louis, in newer, freer and harder circumstances, and in other places, which are neither old or new, have the voice of experience, and there the voice of hope has been heard, sounding different notes in harmonious eulogy of learning and culture and in earnest plea for progress and support.

Whoever reviews these various utterances and makes a note of the topics which are taken up must be impressed with the fact that great changes have come to pass in American education within the last few years, great improvements have been made, and great results are not far off. If then he turns to the venerable shrines at Oxford and Cambridge, before which every scholar loves to bow, and traces the wonderful changes which have been introduced into those homes of conservatism and precedent, since the Parliamentary inquiries of five and twenty years ago began their revelations he will find abundant reasons for surprise and congratulation that the doors have been open to modern science as a teacher, and to nonconformists as pupils. If his eye is turned toward the continent he may see scholastic Germany, the United States of the old world, engaged at this very moment in the foundation of a new University at Strasburg, as the greatest boon which can be given by a triumphant nation to a recovered province—a university which in its comprehensive faculties, its liberal structure, its probable power, approaches the University of Berlin, and may well serve as an example to those in this country who desire completeness, and who want it quick.

Side by side with the university foundations, sometimes a part of them, oftener apart from them, the modern schools of science and technology are springing, up at Zurich, Aachen, Carlsruhe and Vienna, at many places in the new born Kingdom of Italy, and in every State of the American Union, partly under the beneficent action of the Morrill bill for the formation of agriculture and the mechanic arts, and partly under the generous gifts of Sheffield, Cornell, Stevens and their peers. Everywhere, among enlightened people, universities in their most comprehensive spirit are in this year of grace, receiving impulses which are as creditable to the spirit of this age as they are hopeful for the ages yet to come. Especially in this country our State and National Governments have discovered that the questions of the higher education must be met in legislative and administrative councils and in many places are vieing with each other to devise wise schemes of educational development; the builder's hammer is heard in many seats of learning, at Harvard, at Yale, at Amherst, at Princeton, at Cornell, at Philadelphia, constructing the walls which shall furnish homes to successive generations of pupils; collections of books, maps and charts, of works of art, museums of geology and natural history, and archæology, laboratories for chemical, physical, botanical and zoölogical researches are multiplying with a marvellous rapidity; lenses are made for the microscope and the telescope surpassing any which the physicist and astronomer have hitherto possessed; prizes, scholarships and fellowships have been endowed sometimes for continued residence at the college and sometimes (like the Kirkland scholarship, at Cambridge, just given by the historian Bancroft) providing for residence in foreign universities; to the traditional schools of law, medicine and theology, and schools of advanced study are added schools of philosophy, of history, of the fine arts, of chemistry, engineering, agriculture and mines, devices and arrangements to allure young men to higher attainments and to aid them in their onward steps; underlying all this, supporting all this, indispensable to all this, have been the prolific gifts of men of wealth, farsighted and generous benefactors, whose names a grateful posterity will cherish forever as the true nobility of the republic, the lords and gentlemen of the American state.

California's Opportunity.

Such is the hopeful aspect of University education in the States beyond the Alleghanies and to some extent likewise in the valley of the Mississippi. Now comes the turn of this new Empire State, California, queen of the Pacific, to speak from the golden throne, and decree the future of her University;—California, the land of wonders, riches and delights; whose valleys are decked with purple and gold, the luscious vine and the life giving corn; whose climate revives the invalid and upholds the strong; whose harbors are the long-sought doorways to the Orient; whose central city is cosmopolite like Constantinople of old; whose pioneers were a bold, strong and generous class, illustrations of the modern notion that in the struggle for life, the fittest must survive; the builders of whose institutions have been farsighted and catholic, bringing hither the best ideas of many different climes, and laying with faith, hope and charity, the foundations of a modern Christian State, whose people are patriotic, determined and intelligent in a very uncommon degree; whose future no seer can foretell.

California thus endowed and thus inhabited is to build a University. What sort of an institution shall it be? This is the question of the hour. Let us consider it well, for though time only can determine the answer, forethought and faith may be factors in the problem.

Two things are settled by the charter of this institution and are embodied in the very name it bears. First, it is a University, and not a high school nor a college, nor an academy of sciences, nor an industrial school which we are charged to build. Some of these elements may indeed be included in or developed with the University, but the University means more than any or all of them. A University is the most comprehensive term which can be employed to indicate a foundation for the promotion and diffusion of knowledge, an organization to advance the arts and sciences of every sort, and to train young men as scholars for all the various professions of life. Universities greatly differ in their internal structure. The older institutions are mostly complex in their organization, including a great variety of collegee, chairs, halls, scholarships and collections, more or less closely bound together as one establishment, endowed with investment privileges and immunities, and regarded as indispensable both to the moral and material progress of the community, or in other words, as essential both to church and State. In this country the name is often misapplied to a simple college, probably with that faith which is the substance of things hoped for and the evidence of things not seen. We must beware, lest we too have the name without the reality. Around the nucleus of the traditional college which has been so well maintained since the earliest days of this State, we must build the schools of advanced and liberal culture in all the great departments of learning, just as fast as may be possible, and we must at least begin to recognize the various sciences by chairs which may each in its turn be the nucleus of a school or department.

Secondly, the character and the name declare that this is the University of California. It is not the University of Berlin, or of New Haven, it is not the University of Oakland, or of San Francisco, it is the University of the State which has created it. It must be adapted to this people, to their public or private schools, to their peculiar geographical position, to the requirements of their new society and their undeveloped resources. It is not the foundation of an ecclesiastical body or of private individuals. It is of the people and for the people—not in any low or unworthy sense—but in the highest and noblest relation to their intellectual and moral well being.

What Have We to Build Upon.

Bearing then in mind that this is to be a University, and that it is to be the University of California. Our first inquiry is what we have to build upon?

You may all be supposed to know much better than I, the conditions of the State University; but having taken an account of stock, before deciding to join you in an enterprise which seems to be full of promise, a rapid enumeration of the features which have arrested my attention may be of use.

In the first place I observe you have a good Charter; I will not call it perfect, for what human instrument is perfect, but a charter carefully drawn up after a study of the best kindred enactments in the United States, gathering the needful and rejecting the cumbersome, and adapted in all its provisions to the wants of California. The freedom from tuition charges, and the admission of women to the privileges of instruction are two of its most marked peculiarities. The generous recognition of all the arts and sciences, the new and the old with scientific, literary and professional culture, shows a liberal prospect. The long tenure of office given to each elected and appointed Regent adds dignity and responsibility to the Board and tends to conservative and steady progress. The care which has been taken to enlist for the University's service the influence and counsel of the high executive officers of the State, to secure the all important aid of the Superintendent of Public Instruction, and at the same time to enlist a popular interest in its welfare through the Agricultural Society and the Mechanics' Institute, should insure the confidence of the people, while the peculiar mode of selecting the Regents would seem to entirely prevent sectarian or ecclesiastical control.

Under this charter you have a good body of Regents—men, so far as I have become acquainted with them, who are earnest, unselfish, determined and strong, who mean that the trust committed to them shall succeed, and who will not be disheartened by the difficulties and perplexities which beset all great and endearing undertakings. Their unpaid labors deserve the grateful recognition of the community.

The University has inherited a good College, with its buildings for present use, its collections, its repute, its experience, its short but worthy list of graduates, and its hold upon the people of the State. Hence it does not begin entirely anew, but the foundations of over twenty years are ready to be built upon. I cannot here refrain from paying the tribute of gratitude and respect to those pioneers who endeavored with the earliest organization of this State, to establish a college. They followed the footsteps of the earlier pioneers of the Atlantic, who founded the college at Cambridge when the country was still a wilderness. Here the task was no less difficult than there. The lack of funds, the lack of an organized society, the pressure of material wants, in short the struggle for life was so great that the wonder is the college lived at all. It was the harbinger of good not yet fully realized, not yet fully appreciated; but be sure that a hundred years hence, when the centennial of the University is celebrated, as it surely will be, grateful homage will be rendered to the foresight, the vigilance, and the self-denial of those who founded and cherished the College of California. Then, too, just credit will be given to those who were sagacious enough to admit that a University was greater than a college, and when the hour arrived were ready to offer that which had already been accomplished, as the foundation for greater things to come. There are chapters of unwritten history which may some day see the light, and illustrate the intelligence, the public spirit, and the wisdom of more than one of the counselors by whom I am now surrounded.

With other goods bequeathed by the college, the University has inherited a Site at Berkeley, the beauty of which is already renowned, and none can tell what it will be when academic halls and monuments shall have added their architectural charms, and when a society of scholars and of cultivated families shall have made a dwelling there. Some regard it as an open question whether all departments of the University can best be maintained at a distance from the great city, where every form of human activity is manifested, where hospitals favor the study of medicine, and courts of law promote the study of jurisprudence, where libraries and picture-galleries, and the collections of science are likely to be accumulated. Upon this question I will not enter. Fortunate is it that the site selected is so near to the great metropolis of the Pacific—so that ample space, delightful prospects, salubrious air, and academic quiet may all be enjoyed without the complete surrender of the advantages of the town. Indeed, the growth of this neighborhood is so rapid, that one can readily believe that the distance between the city and the suburb, will soon appear no greater than the distance of Cambridge from Boston; it may even be that at Berkeley the time will come, as it has has already come at Cambridge, when the curators will find more space essential to the growth of the University; never, I trust, will an acre of our fine domain be sold.

When I first stood at Berkeley, under the kind auspices of one of the Regents, and looked at the mountains and the bay, the town and the distant glimpses of the open sea, I recalled an hour under the elms at New Haven, more than two years ago, when I listened to the story of how this spot was chosen, of the rides and walks which were directed by an observing eye over the hills and into the valleys of this charming region, with a prophetic anticipation of the coming day when the college germ, already planted, would require a site worthy of its growth. The services of that enthusiastic scholar, whom California would gladly have kept, if Connecticut would have spared him, are honorably recorded in your early college annals, and are not forgotten by those who labored with him; but I cannot forbear to utter at this time the name of one to whose counsels and whose benedictions my presence here is due,—the name of Horace Bushnell.

Among other possessions you have the credit of a good system of Public Instruction, of which the University is to be the crown. I rejoice that it is so, and I hope that in all time to come, the primary school, the high school, the college and the University shall all be regarded as one system, essential and honorable to the State by which they are fostered.

You have a good community, made up in a very remarkable degree of men of intellectual force and superior education. The list of college graduates resident on the Pacific has been scrutinized in the colleges of the East, and the number of professional men who are resident in this immediate vicinity occasions wonder. Here also are graduates of other colleges than the chartered institutions,—those who have been taught in the stern schools of experience, and who have learned wisdom and judgment by the hardest and most varied lessons of practical life. The children of such are now ready for their higher training; how well it will be if they can have a worthy training almost at their own doors.

Again, we have as a foundation on which to build a vast amount of scientific and literary work of the highest order, already performed, and which is good not only in itself but as the seed-corn of future harvest. The work of the United States Coast Survey, for example, in its careful study of the hydrography of the coast, its accurate delineations of the harbors, its study of the tides and currents, its co-operation with men of science at the East in the solution of astronomical and geodetic problems have gained renown for California science, not in our own country only but in Europe. The day is, I trust not far off, when the geodesy of the Pacific coast, will be connected with that of the Atlantic sea-board, and the triangulation of our continental domain will thus be completed as a basis for all future cartography.

A kindred service, and of equal merit has been rendered by the engineers of the army. Then there is the Geological Survey of the State, which surpasses in thoroughness and completeness any kindred work undertaken in the country, and is the delight and pride of all American scholars who take an interest in the lasting investigation of the natural characteristics of the land, either for its own sake or regarded as a basis for social and political growth. I have sometimes thought that this great work would have been more popular if its designation had not been restricted to Geology, for the law requires and the observers carry on much more than geological researches. There is no State in the Union which has such good maps (Massachusetts, not even excepted) as those prepared by the Geological Survey of California, and when the extraordinary diversity of the surface, its vast area, and the lack of roads and habitations are remembered, it is wonderful that so much has been done and so well done in this short time. But the topography is only one part of the survey; its geology, palæontology, ornithology and botany, subjects on which I have less right to speak, are equally commended by those who are expert in these branches of science. Growing out of this survey, though beyond the limit of the State, and under the national authority, are the excellent surveys of the fortieth parallel, by a party of civilians attached to the corps of army engineers. Binding all the men of science together as a brotherhood of scholars is the Academy of Sciences, whose publications are of great scientific value—so valuable that you need not be surprised to learn that a part of the series, the supply of which is exhausted, was transcribed a few days ago with pen at the request of Agassiz, as essential to his work. A young society which has done so well, will be an important supporter of our growing University.

I would remind you, that the literature of this coast has already, like the fruits here growing, a richness and flavor of its own, so that some have even said that California has alone of all parts of America made quite new and original contributions to one literature. The humor, the wit and the poetry of the Sierras are fresh as the breezes of the hill tops, and as spicy as the groves of pine. Oratory has here spoken with a golden tongue, the echos of whose patriotism still are floating around us. To foster genuine literature there is a journal whose fame has gone Overland and over seas as well, the encourager, the suggester, and the producer of that which is choice and enduring.

Where such science and such literature flourish, the day of the university has certainly dawned.

Finally we have to build upon the good will of the State, manifested already in generous appropriations, ripe clearly for generous culture, and ready I believe to sustain and advance its youthful University,

Who are the Builders.

Can we now like master-workmen distribute the parts so that the various toilers will recognize their tasks? Let us make the attempt.

It is on the Faculty more than on any other body that the building of a University depends. They give their lives to the work. It is not the site, nor the apparatus, nor the halls, nor the library, nor the Board of Regents who draw the scholars—it is a body of loving teachers, skilled in their specialties, eminent in their calling, loving to teach. Such a body of teachers will make a University anywhere. Agassiz wherever he goes is surrounded by a company of disciples. Whitney would have his class in language at Berlin or Beuares. Such men will draw not pupils only, but the books and the collections they require as naturally as the voice of Music drew the rocks and stones. The *genius loci*, the spirit of the place, will be the spirit of the Faculty. If truth and culture are their aim, truth and culture will flourish in the college where they toil. If sordid motives or unworthy jealousies spring up among them, the trust they bear will be in peril. More than any thing else, a University requires a large and vigorous staff so that the various sciences and languages may have their devotees, young men of different tastes and characters may find fit guides, the idiosyncracies of one school or chair may be modified and counterbalanced by the qualities of another. It is now difficult both in Europe and this country to secure enough eminent teachers, for other walks of life are better paid and are held in equal honor; let then those who are honorably engaged be not suffered to depart and let their numbers be increased at every opportunity.

The Regents or Trustees of a college have the great responsibility of appointing the body of teachers and of promoting their work. They are the power behind the throne, unseen in the daily work of the college, but never for a moment unfelt. Upon their wise choice of instructors, their careful guardianship of funds, their constructions of buildings, their developments of new departments and schools, their mode of presenting the University to the public will depend the confidence and liberality of the community. On them the shafts of criticism are often inconsiderately hurled, but in the long run, they will add the gratitude of the community to their own consciousness of fidelity and self sacrifice in behalf of learning and the country.

The State authorities, executive and legislative, have also a great part to perform in the support of the University, not by over much legislation nor by hasty action in respect to its development, but by steady, munificent and confiding support.

None of the higher educational establishments in this country will flourish without the support of the ministers of religion. Their counsels, and those of other educated professions, are continually sought by parents and young men; they are interested in all that promotes

[Continued on page 300.]

Domestic Economy.

An Oyster Chapter.

A famoue French cook eays the American ie, without douht, the best oyeter in the world. This heing the case, something more definite about the precious hivalve may be pleasant and profitable.

It often is a matter of much convenience to he able to keep oysters alive in the ehell, especially when one lives a distance from market. To do this, place the oysters in a tuh, with the concave side of the shell undermost, and eprinkle each well with salt and Indian meal. Fill np the tub with cold water, and over the top spread an old carpet or hlanket. Freshen daily the water and food. They may be kept in this manner from a week to a fortnight. The tub must be kept in the cellar.

Oysters raw are inexpressibly delicious, if you happen to like them. Wash the shells clean before opening. Serve with vinegar, pepper and salt. Lemon juice is preferable to vinegar. Horse radish is an excellent addition to the lemon juice.

Oysters pickled will give the happy eater an appetite that only another and another oyster will satisfy. They form a very desirable and convenient dish for parties, country "donations," and, in fact, for any entertainment inclnding refreshments. Remove the ahells and all pieces of shells from one hundred and fifty fine, large oysters. Lay them in a deep dish and strain the liquor over them. Add salt to taste, as salt adds to their firmness. Simmer over the fire until the oyeters are heated through, but not until they hoil. Then drain out the oysters, putting them in a stone jar. To the liquor add a piut of cider vinegar, a large teaspoonful of blades of mace, three dozen whole cloves, and the same of pepper corns. Let all come to a boil, and when the oysters are quite cold iu the jar pour the liqnor over them. They can he used at once—will he better next day—and will keep a week in cold weather.

Stewed Oysters are served as a soup. Open them on a eieve to draiu. Put them, with a little more than half the liquor, some whole pepper kernels, a few blades of mace, and some grated nutmeg, into a stew pan. Simmer gently for five minutes, adding, meantime, a piece of butter rolled in flour, or a quantity of sweet cream, which is better. The oystere need only be heated through to be sufficiently cooked. Try one before removing from the fire. When done, turn the contents over huttered slices of thin toast, in a deep dish.

Crumbled Oysters.—Eight sqnare soda crackers, rolled fine, seven ounces of butter, one quart of oysters. Put the crackers and oysters in alternate layers, dividing the butter equally through, and spriukling a dust of pepper over each one. Use salt spariugly. Have crackers at top and bottom of dieh. When ready for the oven, pour over a coffee cnp of the oyster liquor. Bske a light brown.

Clams make a p latable breakfast dish, stewed, or made iuto fritters. They possess touic properties, and are esteemed by invalids. They may he eaten raw like oysters To stew, wash the shells clean with a scrubbing brush. Add water euough to preveut their burning, and boil until the shells open; then take out and remove the shells. Cook the clams in the same water, adding pepper and hutter. Stir in rolled crackers. Long clams are nice broiled or roasted in the shell.

Lobsters.—A live lobster, weighing from one to two aud a half pounds, is the kind to he chosen. To boil, lay it alive in a fish kettle; cover with cold water; cover the dish well and set on a brisk fire. Boil from fifteen to twenty-five minutes, accordiug to size. When boiled, take it from the kettle, separate the body from the tail, aad place in a colander to drain. Use everything but the stomach and the black or blueish vein running along its back and tail. It is eaten with salt, pepper, vinegar, oil, muetard and chopped parsley. Crabs may be broiled and eerved similarly.

Craw-Fish, sometimes called river or fresh water crahs, and often taken for young lobsters, are excellent to eat, decorate dishes finely, and are dressed and served like lobsters and crabs.—*Rural New Yorker.*

The Ventilation of Cupboards.—In the sanitary arrangement of houses, even for the richer classee, the ventilation of cupboards is neglected. In places let out as tenements, closets are the receptacles for bread and the fragments of various other kinds of food. Often the dirty clothee are put away in these placee waiting for the washing. It is therefore most important that air should he plentifully paesed through snch corners; generally, however, there is bnt little arrangement made for tbis purpoee. The doors are kept close without any perforation. There are no veutilatore in the walls and, in conesequence, those places become caes of polluted air, which, when tbe doors are opened, escapes over the apartmente. This defect is visible in nearly all houses of old date; and while looking at some dwellings of recent construction it is seen that, although care has been generally taken to ventilate stair cases and rooms, the cupboards are in this respect neglected.—*Ohio Farmer.*

Cool, But Not Clean.—Bogue ice cream ie mainly manufactured of oorn starch, French clay, and poieonous coloring matter. The beautiful carmine which pervades the treacherous compound comes from the cochineal bug. A continued course of this poieon produces the moet terrihle maladies. Firet dyspepsia, then scrofulous eruptione, accompanied hy a looseening of the teeth and a dropping out of the hair. After this a deathly lassitude seizee upon the frame of the unfortunate victim, and insanity or hopeles idiocy ends the unfortunate career. From experiments made by eminent physicians in France, it hae been shown that four ordinary plates of thie horrible mixture will cause death in from one to two hours. The same quantity given to a baby will produce at first convulsions, and in five minutee afterward a state of coma—ending in a most terrible death. This agent of deetruction is not confiued to the street corners alone. It lurks in gilded saloons and places of fashion resort.

Preserving Milk.—It is said that milk can be kept a year or more as sweet as when taken from the cow, by the following method: Procure hottles, which must he perfectly clean, sweet, and dry; draw the milk from the cow into the bottles, and as they are filled, immediately cork them well, and fasten the cork with packthread or wire. Then spread a lit le straw in the hottom of a boiler, on which place the bottles, with straw between them, until the boiler contains a sufficient quantity. Fill it up with cold water, heat the water, and as soon as it begins to boil, draw the fire, and let the whole gradually cool. When quite cold, take out the bottles and pack them in sawdust in hampers, and stow them away in the coolest part of the house.

The River Nile.

The bed of the Nile, like that of the lower Mississippi, is higher than the valley through which it pasees. Warburton said: The Nile's hed is a sort of savings bank by means of which the deposits of four thousand years have enabled him to rise in the world and run along a causeway of his own." It is the only river in the world which runs upward of twelve hundred miles, iu undiminished volume, without a tributary stream. It moves on its long course without the help of even a creek, tapped by innumerable canals and thirsty gardens with which it is fringed, abeorbed by hot sand banks aud hotter sun, and emptiee greater bulk at ite mouths than it has between the cataracts. The products of Egypt are the gifts of this stream. The land on which the towns and hamlets of Egypt repose is foreign soil, brought from the far south by this public carrier. For more than four thousand years he has faithfully brought his burden and deposited it at the feet of Egypt. The Rameses and the Ptolmies come and go, aud the Nile remains unchanged.

Narrow Gauge Railways are exciting great attention in Great Britain, and Mr. Robert F. Fairlie has just published in London a pamphlet entitled "Railways or No Railways, or the Battle of the Gauges Renewed in 1872." The pamphlet comments severely on the English reviews of the report of Gen. Buell in favor of a three feet eix inch gauge for the Texas Pacific Railway, and arrives at the conclusion that hroad gange means "costliness with extravagance," and narrow gauge means "economy with efficiency."

Poplar Lumber for California.—One car load of poplar lumber was shipped from Indianapolis to San Francisco, Cal., the other day, the freight on which was four hundred dollars. They have no poplar growing west of the Rocky mountains, and have been shipping it round Cape Horn altogether till recently the Overland Railroad has transported large quantities to the Pacific alope.—*Am. Manufacturer, Oct.* 17.

Abalona Shells.—Sixteen tons of shells have been ordered from this coast by two firms, one in Boston and the other in Philadelphia. They are for manufacturing into buttons and many kinds of fancy articles, and bring good prices. The islands opposite to this county are literally covered with the finest shells for this purpose found in the world. Why are they not utilized? On the shores of Anacapa of Santa Cruz, a few men could soon load a schooner.—*Ventura Signal.*

Sherman Island.—The overflow of Sherman Ieland last winter, although producing great damage, was not wholly destructive. The farmera have been enahled to raise a fair crop of potatoes. The Antioch *Ledger* says that the levee is approaching completion, and that its dimensions are such as will hereafter prove an effective barrier to the floods.

The Last Novelty in Patents.—Three Chinese have taken out a patent in Parie for the invention of a new automatic and autographic continuons telegraphic instrument, by the aid of which apparatus the dispatch ie transmitted to the receiver as an exact fac-simile of the transmitter's autograph.

Land in Sonoma.—William Hooper, of this city, is the purchaser of General Sewell's farm of 1,000 acres, five miles from Sonoma, for $35,000.

Large quantities of dark-colored salmon trout are canght in Eagle Lake, near Snsanville, weighing from two to fivs pounds sach.

The Cotton Plantations.

The cotton plantations are upon the Merced river bottom, from three to eeven milee below Snelling'e, and mostly in the vicinity of Hopeton, the latter a small place where there ie a post-office, a store, a blacksmith shop, and a dozen or more other houses.

Col. J. M. Strong has 200 acres of cotton planted this year, npon the farm known ae the Stockard place, six miles below Snelling's. The Buckley Brothers have 250 acres of cotton planted on their farm, next below Strong's. J. B. Coconaur has from 12 to 15 acres of cotton on the south side of the river uear Col. Strong's place. C. S. Peck, three miles below Snellings has 75 acres of cotton on his farm, a short distance above. Claihorne Dean in the eame vicinity, has 25 acres of cotton, and Mr. Farrell has five acres. His farm adjoins that of Peck. A. B. Anderson, the hotel keeper at Snellings, has a few rows of cotton in his garden, which people passing through the town who have not come to visit the large plantation can readily examine.

The Crop.

I have visited and examined with much interest all these plantations, excepting the small one of Mr. Farrell. I would say generally that there is very little difference in the condition of the crops upon any of these plantatione. Iu every one of them it ie apparent from the most casual inepection that no plant ever grew more luxuriously, and in every possible way evinced the complete adaptation of the soil and climate in which it was placed, to its growth and the maturity of its fruit, than do the cotton plants here. They are evidently healthy, strong and vigorous. The amount of growth made in a eingle season is remarkahly large. Many of the stalks are over an inch in diameter, and from four to six feet high, with abundance of branches. The number of holls upon a branch is large, in fact, eometimes out of all proportion to the size of the plant, for branches half an inch in diameter are frequently seen broken down from the main stalk by the weight of the bolls they contain. The bulk of tbe bolls are well advanced towards maturity and beyond the reach of damage from frost. Ou the strongest plants the lowest branches are so loaded down that the bolls lie upon the ground and are also shaded from the sun. Usually these bolls are not yet open. The bolls upon the next branches above are now beginning to open well, so as to be ready for picking. Ou the branches above these again the bolls are from as largo as pigeon's eggs to full size; but not yet opening, while at the tops of the plant aud on the ends of the branchee, new leavce are yet putting out; blossoms are still opening, and squares forming, which, of course, will not reach maturity before tbe plaut is killed by frost. Now, however, the plants are full of vitality and will mature, all but the lateet sets of blossoms aud bolls. A single frost would open these fruits of all the bolls formed, and render the entire crop ready for picking. This is on the moister land, where irrigatiou was applied.

On the small patches, where the soil ie light and thin, and underlayed hy gravel which has drained it of moisture, the growth of the plant has often ceased, the leaves are yellow aud drying up rapidly, no new leaves or blossoms and squares, and all—or very near all—the bolls are completely open and ready for picking. On these patches, where a good stand of plants was obtained, the cotton will average, at least, twenty good, perfected holls to the plant. Where it is a little better, there will he as many bolls already matured, or nearly so, and ten or a dozen more that will yet mature aud open.

There are occasional emall patches of drift eand, where the stand was lost entirely, and the land is bare, or nearly eo. Whenever a few plante in euch cases survived, and stand pretty much by tbemselves, the growth is remarkably vigorous and rank.

The patches upon which the crop was lost by the drifting of the sand and hy extreme dryness are not numerous, very small and of little importance. The patches upon which the plants started well but have now matnred and ceased growth and are only developing or have already developed and opened all the bolls formed, are aleo emall and not sufficient yet to juetify the employment of any large number of cotton pickers. In theee patches the plants are from eighteen inches to three feet high.

On the moister lands where no irrigation has been applied, the plants throughout, stand from three to five feet in hight with plenty of side branches. On lands that are still damper, and those where irrigation has heen applied, the growth is extremely rank, the plants are five aud six feet high, the branches are so thick as to shade the ground completely, though the rowe are four feet apart, the branches interlock eo thickly as to render it difficult to pass between them. Upon such plants the number of bolls and squares is enormous and the blossoms continue to open. Mr. Buckley assured me he had counted over four hundred bolls and squares upon a single plant, about twenty-five more than the largeet number observed in any instance last year. In fact it is not desirable to have so rigorous a growth as irrigation produces, and even this year the Buckley Bros. did not irrigate at all, while upon other plantations sometimes only portions of the crop were irrigated, and next year, if eimilar to thie, little or no irrigation will be nsed on any of the Merced cotton farms.

Cotton Picking—Splsndid Results.

Mr. Strong commsnced picking on September 26th, and has a pile of seed-cotton in his barn over thirty feet long, twelve feet wide and five feet high. Mr. Peck had five hands picking during the past week. Mr. Coconaur had a couple of hands picking on Friday for the first time. The Buckley Bros. eay that this year the stand ie finer, larger, and looke hetter in every way than laet seasou, and promisee a larger yield. Samplee of the staple you have already eeen are of euperior quality. Last year the crop upon their farm yielded twenty-one or twenty-two thousand pounds of ginned cotton, the area cultivated being fifty-one acres, being at the rate of 400 pounde per acre. Every one who sees the crop speaks well and favorably concerning it. All pronounce it entirely successful and no longer experimental, being quite as snre and eafe ae any other crop. People from the cotton-growing regions of the Southern Statee all say they never saw better looking or more promising cotton-fields, and many say they never saw their equal.—*Cor. Bulletin.*

Increased Consumption of Sugar.

Though the manufacture of sugar was commenced in the West Indies early in the sixteenth century, yet its use in domestio economy did not become general in Europe or America before the beginning of the last century. In the year 1700, only 10,000 tons were used in Great Britain, though the English were at that time the leading manufacturers of sugar. The consumption of sugar in the British Islands in the year 1870 is stated at 600,000 tons. In this country the consumption of sugar is steadily increasing. Since the close of the late war, the ratio of increase has been about 10 per cent. annually, and in the year 1871 the sugar consumed in the United States amounted to 700,000 tons, an increase of 15 per cent. on the preceding year. This is the largest consumption of sugar, in proportion to the population, found in any nation on the globe. A very small proportion of the sugar consumed in the United States is produced withiu our owu territory, while in Europe the production of sugar is rapidly increasing and bids fair soon to render the principal nations of that quarter independent of the tropical regions in regard to the supply of sugar. Since the year 1850, the production of sugar from beets in France has risen from 60,000 tons to 300,000; in Austria, from 10,000 to 80,000 tons; and Russia, where beet-culture was introduced since 1850, now produces 100,000 tons of sugar. The increased consumption of sugar may be taken as the evidence of an advance toward a higher civilization.—*Ag. Report for September.*

Result of England's Coal Famine.

A correspondent of the New York *World* writes from Washington as follows: The people of this District, surfeited with politics, are now experiencing a genuine seneation in the growing up of important commercial connections with England and the British Provinces, growing out of the coal famine. Coal is now actnally being shipped from the port of Georgetown direct to India, to South America and the West Indies. It is authoritatively etatod that several hundred thousand tons of American coal have recently been purchased here on orders traneferred from England to the United States. The greater portion of these purchases is of the soft or bituminous coal of Maryland. The larger number of these ordere will be filled at the Cumberland mines, and will be sent thence to Georgetown by way of the Cheeapeake and Ohio Canal for trans-shipment. Several vessels have already left this port within a few weeks with cargoee for foreign conntries, and others are expected to arrive and clear before the close of navigation. Foreign bottoms are mainly employed for thie service, because of their peculiar rig and construction, which render them more seaworthy than American vessels.

A New Enterprise.—Among the new enterprises in coutemplation among some of our capitaliste is the erection of a flax-mill. This will set our farmers to thinking about the raising of flax. Linen goods may be manufactured here as cheaply as iu any part of the country. Besides it is another step toward the encouragement of home manufacturing interests, which are so much needed to make our city prosperous. We are assured that such an establishment will be constructed somewhere within the city limits, if a site suitahle can be had. If not the company will go to some adjoining city, probably Oakland or Alameda.

The Annes on a Decline.—A recent nnmber of the *Ausland* tells ne a sad story of diminiehed altitude. Quito was fonnd by La Condamine in 1745 to be 9,596 feet above the sea; Humboldt, in 1803, could only make 9,570 feet of it; Boussingault, in 1831, wae started to find it waa only 9,567 feet; Orton, in 1867, found it reduced to 9,520 feet; and Reiss and Stuhel fonnd, in 1870, that it had shrunk to only 9,356 feet above the level of the sea. Quito, it seems, has annk 246 feet in 125 years, and Pichincha 218 feet in the same period. Its crater has sunk 425 feet during the last 26 years, and Antisana 165 fsst in 64 ysars.

It is Cheaper Handsomer, more Durable and Elastic than the best of any other Paint.
Office, corner Fourth and Townsend streets, San Francisco. Send for sample card and price list.
15v23-3m HELY & JEWELL, Agents.

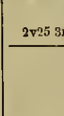
Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Opsrates as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street,
San Francisco

S. W. HOWLAND & CO.,
Crushers and Samplers of Ores,
No. 16 DRUMM STREET,
BETWEEN CALIFORNIA AND SACRAMENTO STREETS.
S. W. HOWLAND, the Pioneer Crusher and SAMPLER of Ore and Pulverizer of Mineral and Chemical substances, has returned to San Francisco and resumed business at the above, his original stand. He wishes it to be DISTINCTLY UNDERSTOOD that having several months ago dissolved partnership with Mr. Thurman at the Mission Street Mill, he has now NO CONNECTION WITH THAT ESTABLISHMENT whatever.
The Same Faithful Sampling
Formerly performed by him may be relied on, and such is guaranteed. oct9l5p3m

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.



Of all sizes and in any quantity, furnished to order Full instructions sent for operating.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

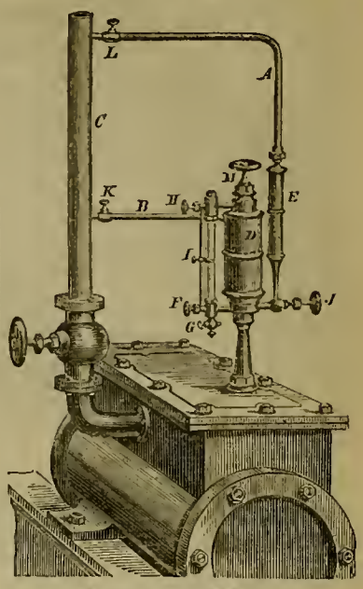
SHEET IRON PIPE,
THE
Risdon Iron and Locomotive Works
Corner Howard and Beale Streets,
Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.
Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.
☞ All kinds of Machinery made and repaired.
24v22-3m JOSEPH MOORE, Superintendent.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM
Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.
These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and steme lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopped; H, F, valves to shut off in case of frost, steam does not enter the cup; it is always cool; warranted to give satisfaction Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

Agents Wanted for Zell's Encyclopedia.

Z.E. is a Dictionary of Language. It contains every word in the English language with its derivation and definition.
Z.E. is a Biographical Dictionary. It has a sketch of every noted person of all ages, many of them with portraits.
Z.E. is a Complete Gazetteer. It has a description of every county, sea, lake, river, mountain, town, etc., in the world.
Z.E. is a Medical Dictionary. It contains a description of diseases, remedies instruments, surgical operations, etc., etc.
Z.E. is a History of the World. It contains a description of the migration of races, the progress of nations, their customs, laws, religions, etc.
Z.E. is a complete Natural History. It describes all animals, birds, insects, fishes, and reptiles.
Z.E. is a complete work on Botany. It describes every plant, flower, vegetable, and tree, with their properties, uses, etc.
Z.E. is a complete work on Mechanics. It describes all new inventions, engines, machinery, tools, etc.
Z.E. is a complete Church History. It describes impartially the various divisions of the church of all ages.
Z.E. is equal to a whole library of works. It describes every material or non-material thing that is capable of description in the language.
Z.E. is well illustrated. It contains nearly three thousand engravings of persons, animals, plants, trees, flowers, machines, buildings, etc.
A specimen number, containing forty pages, will sent to any address on the receipt of ten cents. Sold only by subscription. Apply to

Manufactured at the CYCLOPS MACHINE WORKS, 113 and 115 Beale street, San Francisco.
3v24-3m WM. CALDWELL.

[Continued from page 297.]

intelligence and truth; they have been from the earliest colonial days the founders, guardians, and teachers of our best institutions. I trust this University will always merit their support for if worthy it will surely win it.

The Press is another social power on whose help we must rely. It can quicken or retard the establishment of a complete University, by its favoring or censorious attitude. Its criticism, the University should not fear; its cordial support the University should desire. Powerful everywhere, the Press in a free country is a force which all must appreciate; let us hope that its assistence will be generously accorded.

On the men of wealth in this community I greatly rely. It is true the State has been, and is likely to be liberal in its appropriations,—but a new University requires almost unlimited means for its support. The library alone could well employ in the purchase of books, and the payment of salaries, the income of half a million of dollars. A school of science would not be liberally endowed with a capital of that amount. Funds to the extent of several thousand dollars might be annually be employed in scholarships and prizes. Homes or halls will be needed in some form or other for the occupation of the students when the University goes to Berkely. Professorships representing studies which are not taught to undergraduate students, but which should be cherished in the University must also be founded. I trust the day will come when the spire which silently points heavenward will mark our place of worship. But for all these things we cannot expect the public treasury to be opened. Relying upon that for the most essential things, we must look to men of wealth to provide more complete endowments.

What are we to Build.

[This portion of the address is here omitted. It consisted of a discussion of some of the elements which make up an American University,—the classical college, the school of science, the departments of agriculture, mining and mechanics arts, the advauced schools of physiology, philosophy, law, medicine, the fine arts, and other branches,—the library, the museume, the observatory, the fellowships and scholarships.]

The Spirit of the Builders.

[Under this head allusion was made to the necessity of keeping the individual subordinate to the University; of building both for the present, and for the future; of maintaining an Catholic liberelity toward all departments of le rning; of keeping well before us a high ideal. Reference was also made to the relations which should subsist between the scholere and the teachere, and between the teachers and the public; and to the possibility of promoting simultaneously abstract science, and practical advantages.]

Method of Building.

One of the next topics to he considered is the relative importance of different branchee and what studiee most deserve encouragement? Shall literature and language, the traditional classical course of our colleges be made first in rank? or shall the place it has held he given up to science in its theoretical and practical aspects? are the modern languages to he chosen rather than the ancient? shall history and political science, with the etudy of the Roman law, or the theory of the State be preferred; or shall mathematice he the dominant theme? is the acquisition of knowledge, or the acquisition of discipline, as it is called, be the end of instruction? Shall general etudiee which may he presumed to have an equal value in all the varied callings of life, or epecial etudies which have decided reference to a profeeeional or technical career be commended to the ycuthful student? shall lectures, or shall recitations. or shall literary and scientific research be the method of education? shall univereity freedom of choice and of work he permitted, or shall collegiate restrictione and control he insisted on? These and a score of kindred questione are now under discussion in the various colleges of this country.

A part of the difficulty arises from confnsing the requirements of young scholars, like those who have just left the high school and the academy, and those of more advanced etudents whose tastes, talents and wants are specialized. Give the former, prescription; give the latter, freedom; hut let prescription vary with the varying peculiarities of individnals,—and let the freedom allowed, he the freedom which ie governed and protected hy law. College work for college hoys implies daily guidance under prescribed rules; professional work impliee voluntary, eelf-impelled euthusiasm in the acquieition of kuowledge.

Another difficulty arises from the rapid extension of human science. It would be impossible for any one, were he gifted as Leibnitz, or long-lived as Humboldt, to master the details of modern researchee. The average scholar, haviug neither the genius of the one, uor the life-assurance of the other, muet be content to fill a much more restricted field.

I take it for granted that in the State of California, thcre is occasiou to make a plea for the study of modern science. The need of civil, mining and mechanical engineers, of expert geologists and mineralogists, of devoted naturalists, and physicists, of chemists and metallurgists, of geologists, topographers and mapmakere, of agriculturists, mechanics and manufacturers and merchants, well trained for their various callings is now so obvious, that I need not advocate the importance of science in education. Its place is acknowledged. The question is how to secure the hest eort of inetruction, the fullest sequence and relation of studies, the most emiuent teachers, the most complete lahoratories, and the best apparatue; and likewise how to encourage that special proficiency which is indispensable to success in modern scientific professions with that literary culture which makes a scholar, and hefits a gentlemen. Health, wealth, popular intelligence, and the spread of Christiau civilization are eo dependent npon the discoveries of ecience, and the applications of these discoveriee to a thousaud useful arts, that a young and still undeveloped State may well afford to he liberal in the enconragement of this class of studies. How best to secure this scientific education it would take long to tell and I postpone the epecial consideration of this theme for another near occaeion.

But while nature and its laws in all their various aepeote and applicatione are thus engroesing, Man and all his experience and achievemente are likewiee of tranecendent importance. Above all matter is man; above hoth matter and man, ie the "Divinity that shapee our ende, rough hew them ae we will." So that the individual or the institution that regards the natural forces of this glohe only, without observing likewise the intellectual and spiritual forces which are aleo at work, sees only half the world.

I recognize in the fullest degree the need there is of science. Give us more of it and not lese. Encourage the moet thorough and prolonged eearch for the truth which is to he found in the rocke, the eea, the eoil, the air, the sun, and etars; in light and heat, and magnetic forcee, in plants and animale, in the human frame, in phyeical ethnology and in archæolgy, hut let ue also learn the lessons which are embodied in language and literature, in laws and iuetitutione, in doctrines and opinions, in historical progress and international relations. Let language, hietory and literature, oratory, poetry and art still form a chief part of liheral culture, while mathematical, physical and natural sciences be admitted to the rank from which they have long heen excluded.

When the time ehall come to discuse in detail the poesible changee in the university coureee, when an enlarged faculty and increasing funds shall enable the authorities to provide a more generous and varied culture, we shall find the experience of other institutions in a high degree suggestive

At West Point we see the excellence of enperior mathematical training, a well devised course of text-books, rare qualitiee in the chief mathematical inetructor and in his associates, power to prescrihe exactly what the course shall be, life-long honors dependent upon success; hence comes the renown of that school of Engineers from which Bache and Humphreys, and Trowhridge have heen sent forth. The echolar's choice ie Hohson's.

At Harvard, in the undergraduate department liheral provieion is made for instruction in ancient and modern languages, in chemistry, mining, physics, mathematics, in history, metaphysics and ethics, in hotany, mineralogy, and natural hietory. The choice in all this variety of studiee ie given to the scholar, soon after his entrance.

At New Haven, the traditional college course has heen maintained with a cordial recognition of the modern languages and of history; and side by eide with thie classical college, the Sheffield School of Science hae grown up, where scientific etudiee predominate. The scholar chooeee when he enters between the scientific and the classical course; the latter allows but little further freedom of election,—in the Sheffield School, there ie again a choice between eeven different courees.

At Cornell Univereity, there ie the Harvard freedom of choice with easier conditions of admieion to all lines of study hut the classical, with manifold modern appliances and helps for the pureuit of technical and scientific etudiee, and with a generous recognition of history and humanity fostered by the etudies of Preeident and of the illustriove Oxford graduate, who hae there made his home.

At Princeton, eince the acceseion of the able Scotch metaphysician who guides its affairs, required etudiee, mathematical and linguistic as of old, engage the stndent in his first two years; in the last two yeare of hie residence, he eelects one of eeveral prescrihed specialties.

Besides these universitiee and colleges we must also inquire what the independent echools of agriculture and technology are doing, as in Boeton and Amherst, Hoboken and Troy, Urbana and Laneing.

English and German experience will likewise be of valne. Everywhere the problem is one, hut the solutious are manifold, for the conditions are complex and vaguely determined.

The Need of a School of Science.

With all the experience of other placee hefore us it ie my helief that one of the first wants of California is a distinct, complete and well organized school of science and technology, such ae your organic laws contemplate, in which men of eminence shall have the means and leisure to make reeearchee in all the departmeuts of investigation, to whom young men shall resort for traiuing in the etudies which are closely related to the development of minee, agriculture, manufacturee and means of transportation, and from whom the public at large, by the press, by the lecture aud by informal conenltation, may be instructed in the characteristics of this remarkahle country and the mode in which its resources cau he made most serviceable to mankind. My chief anxiety is whether the people of this coast are yet ready to pay for the luxury and the advantage of so serviceahle an institution. It will require a great many teachere, costly laboratories, large funds,—more I fear than the University with all the claims npon its treasury is yet able to command. Perhaps some individual whoee experience has brought him the valne of ench knowledge, and who has an honorahle ambition to have a name among the beuefactors of the State will supplement the resourcee of the University with a generous private gift like those which have done eo mnch for the culture of Eastern youth and the improvement of the Atlantic Statee.

A Plea for History and Language.

[The address next considers the importance of historical and linguistic study—eepecially with reference to the geographical and historical elatione of Califo ruia.]

The recognition which should be given to religion in a State University involves considerations which are not to be encountered in colleges founded by church authorities or by private corporations. The old English colleges, whose traditions New England has gratefully accepted, were the children of the church, and though their doors are no longer shut to nonconformists, their ecclesiastical character is still decided. Harvard College, the mother of all our higher institutions, still bears upeu its escutcheon "Christo et ecclesial," the motto of its founders. Yale College went back to the Old Testement for a symholic watch word, and bears upon its seel, the open oracles inscribed with Hebrew characters. At Nassau Hall, we are told that "in regard to religious truth there will he no uncertain sound." At Cornell University a generous gift has heen accepted for a chapel, with a foundation, if I am rightly informed, which will secure the services of eminent preachers, and with a plan for daily religious worship. But none of these institutions is a State University, though all of them were fostered in their infancy by the kindly nourishment of the public treasury. We are on the contrery the guardians and friends of a State University, estahlished in the midst of a community more varied than almost any in the land. Here ere still seen the traces of the Spanisb pioneers who brought to these shores so long ago, with the symbol of the cross, and the emblematic keys of the Roman pontiff; nearly all the various forms of Christian faith which the Episcopal and non-Episcopal churches of the Reformation have adopted, find here their advocates; there are many among us, likewise, who look for a Messiah yet to come; and crowding into these harbors behold the children of Confucius and the worshipers of the Unknown Gods.

The State, as a body politic, protects the assemblies and the worship of all these bodies; it favors none. How shall it he with the University and the public school which perform the service of the State in the education of the young? Shall religious teaching he excluded from the University, or shall it have a covert end apologetic placo—shall it he an organized force or a silent and all pervadiug influence? Shall its spirit he narrow eud sectarian, or shall it he catholic and free? The difficulty is not felt in Califoruia aloue. It is involved in the toleration of the modern Christian state toward all forms of religious belief, and in its generous provisions for the promotion of education. In meeting the difficulty it may be well to beer in mind that religion includes four different elements, worship, doctrines, precepts end spirit. A religious spirit no ono objects to; it is the spirit which works "outward and not inward, upward and not downward, forward and not backward, and wbich lends a hand;" it is the spirit which "loves justice, shows mercy and walks humbly hefore the Lord;" it is the spirit of truth, of faith, of hope aud of charity; it is the spirit of "peace on earth, good will to meu." We may say as we say of scieuce, the more we have of the genuine the better for mankind. Whatever precepts will tend to cherish the inward spirit and the outward uprightness end unselfishuess which procced from it, all good men will welcome. When we begin to formulete doctrines into creeds and symbols, then comes controversy aud difference—the right wiug against the left wing, the conservative against the liheral, so that an attempt to enforce the doctriues of thie or that ecclesiastical body will be sure to come to grief. The University is no place for sectarian controversy or denominationel zeal. It is a school of learning. But as a school of learning it must teach the history of opinion and helief, it must teech the riso end growth and decay of institutions, it must show how Christian civilization has overcome pagan practices and helief, and hes purified the home, the State, and the relations of nations, modifying laws, usages, manners and language, establishing charities, reforming prisons, securing honesty, virtue and justice. All this should be taught hy scholars and not by partisans. If the body of teachers and scholare imbued by this spirit of truth and cherity will daily essemhle of their own accord to acknowledge their dependence upon Divine wisdom, to chaut a Psalm of David, and to join in the prayer which the Master taught his disciples—who can doubt that this communion of worship will elevate the character of all who engage in it aud of all tho institution to which they belong? So far as this I would have this Univcrsity go, forcing none to attend upon such religious worship, drawing all to it by tbeir own consciousness of its value.

But many would go further than this. Many a parent, many a religious teachcr, many a church desires and insists that, youth at the critical period of college life shall be surrounded by positive, outspoken, and persuasive religious influences. They are afraid of a State University, and long for a denominational college. Hence come the many attempts to promote the higher educatlon, when one united effort would hardly be adequate. But it seeme to me that tho end in view might be secured by hetter methods. Why may not any religious body or association, or private individual, desirous of protecting the young men from temptation and encouraging them in the higher life, estahlish in connection with the University, a home, or hell, or college, which should be controlled according to the founder's views, should be a privileged residence, should be endowed perhaps with prizes and purses. I can imagine on the slopes at Berkeley, a group of students houses, bearing honorable nemes, end made attractive by the convenience of their errangements, the good fellowship within their walls, the privileges of the foundation. I should hope they would not be barracks, or dormitories—but homes, with rooms of common essembly and of private study. I should hope the beth room, and the dining ball would be included in the structure, and if any would go so far as to have a place of light amusement and recreation, I for one, should not object. Within such college halls, associations would be cherished like those of Oriel and Christ Church at Oxford, of South College and Faruam Hell in New Haven. Here too, und r rigbt guidance, the hest of moral and religious influence migbt be promoted. What church, what association, or what generous individual, will be tbe first to establisb such a hall?

Conclusion.

[The address concluded with the question, "What is all this culture for,"—an eulogy of the services which High Schools of learning have rendered to the world, and an appeal for generous confidence and support so that the University of California may become worthy of the great name of the State, and of its leading position in the next or Pacific phase of human civilization.]

SINGULAR EXPLOSION.—Some workmen were recently engaged in a blacksmith ehop, in heating the piston of an engine employed at an Englieh colliery, when a sudden explosion of the iron occurred, by which two men were killed and several othere injured. It was the opinion of the jury of inquest that water had found ite way into some cavity in the piston, which heing suddenly converted into steam by the heat of the forge, caused the explosion.

MINING SALES.—We learn from the Humboldt County *Silver State*, that the Butte mill aud mining company's property, at Rye Patch, has heen sold to a San Francisco Company for a price which rumor ecte at $100,000.

ELECTION.—Tbe St. Patrick Mining Company have elected the following Trustees: Robert Sherwood, (President) W. B. Bourne, J. W. Gaswiler, John F. Boyd and Joel F. Lightner; Superintendent, J. H. Crossman; Secretary, D. A. Jennings.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

FOR WEEK ENDING OCTOBER 8TH, 1872.*

STONE-PAVEMENT.—Jacob Bolliger, S. F., Cal.

METHOD OF BLASTING ROCK.—James Brodie and Samuel H. Wheeler, S. F., Cal.

TURBINE WATER-WHEEL. — James Cumming, Ione City, Cal.

COMPOUNN FOR DESTROYING BED-BUGS.—Elizabeth Hooper, Diamond Springs, Cal.

SEWING-MACHINE.—Abednego D. Hopkins, S. F., Cal.

HYDRAULIC ELEVATOR.—Timothy Stebins, S. F., Cal.

SAFETY DEVICE FOR ELEVATORS.—Timothy Stebine, S. F., Cal.

AUTOMATIC BRAKE FOR MACHINERY.—Timothy Stehins, S. F., Cal.

REIN-HOLDER.—Edwin Charles Every Vile, Santa Clara, Cal.

*The patents are not ready for delivery by the Patent Office until some days afterword.

NOTE.—Copics of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) et the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other ageucy.

New Incorporations.

RED JACKET M Co.—October 31. Location: French District, Owyhee County, Idaho Territory. Capital stock, $2,000,000 in 20,000 sharee Trustees—W. M. Lent, John Boyd, M. J. McDonald, G. W. Grayson and Hill Beachy.

BROWN'S VALLEY CONS. M. Co.—October 31. Locatiou: Yuba County, California. Capital stock, $2,500,000 in 20,000 shares. Trustees—J. M. Livingstou, Geo. W. Bowie, F. B. Stieb, P. S. VenRensslaer aud W. I. Kip, Jr.

WASHINGTON QUICKSILVER M. Co.—Novemher 1. Location: Trinity County, California. Capital stock, $8,000,000 in 81,000 shares. Trustees—George C. Hinckley, A. C. Taylor, J. W. Winter, C. L. Williams and Q. L. Adams.

PORTLAND S. M. Co.—Novemher 2. Location: Ely District, Nevada. Capital stock, $3,000,000 in 30,000 sheres. Trustees—J. W. Gashwiler, Joel F. Lightner, Henry Raymond, B. F. Sides end G. W. Lightner.

YELLOW STONE M. Co.—Novemher 2. Location: Ely District, Nevada. Capital stock, $3,000,000 in 30,000 shares. Trustees—Henry C. Hyde, Geo. W. Allen, Roht. Sherwood, Geo. B. Treadwell and M. A. Sharp.

THE CALIFORNIA HIDE AND LEATHER CO.—Novemher 4. Object: The manufacturing of leather and dealing in hides, leather findings, material, aud all matters appertaining to a hide and leather husiness. Capital stock, $100,000. Trustees—E. W. Park, J. A. Nickerson end William Knight.

THE FIRST CHOICE DIAMOND M. Co.—November 6. Object: Mining for gold, silver and other precious minerale and substances in all tho States and Territories of the United States. Capital stock, $10,000,000 in 100,000 shares. Trustees—John F. Boyd, J. W. Bost, Chas. D. Cleveland, E. M. Fry and F. B. Latham.

And in accordance with law, and an order of the Board of Trustees, made on the third day of October, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at No. 327 Montgomery street, San Francisco, Cal., on the 25th day of November, 1872, at the hour of 10 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.

Office, 28 Merchants' Exchange, California street, San Francisco, Cal. no9-3t

Excelsior Silver Mining Company—Location

of works, Yellow Pine District, Lincoln County, Nevada.

At a meeting of the Trustees of the above named company, held October 29th, 1872, at the office, No. 640 Washington street, San Francisco, it was, on motion, ordered that the following resolution, which was unanimously passed at a meeting of the Stockholders, held on the 28th, 1872, be advertised for one month in the Mining and Scientific Press, and a personal notice served on each member:

Resolved—That we, the Stockholders representing in our individual names 4,480 shares of the Excelsior Silver Mining Company, do hereby mutually agree to return our individual certificate or certificates of stock now held by us and standing in our names, agreeing that upon a pro rata division of the entire stock between the stockholder, that we will individually pay a monthly assessment of ten dollars ($10) per month for one year, unless sooner rescinded by the Trustees of said mine.

Also, that said monthly assessment shall be paid on or before the tenth day of each month, commencing November 10th, 1872. By order of Trustees,

no2-1m W. A. KOLLMYER, Secretary.

Golden Rule Mining Company—Location

of works: Chili Hill, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1872, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at the office of the Company 432 Montgomery street, (Room No. 5) San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the third day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fourth day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. B RUSSELL, Secretary.

Office, Room No. 5, 432 Montgomery street, San Francisco, Cal.

Indus Gold and Silver Mining Company—

Location of works, Virginia City, Storey County, Nevada.

NOTICE is hereby given that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1872, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at No. 24 Merchants' Exchange, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 24 Merchants' Exchange, California street, San Francisco, Cal DAVID WILDER, Secretary. oc26-4t

Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of October, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 220 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 21st day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. H. CORNELL, Secretary.

Office—No. 220 Clay street, San Francisco, Cal. oc19-4t

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly teeted in the East for Three Yeare, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperatures.

The timber used is placed so directly in the line of strain, that less material is required to support the eams load.

It is not perceptibly affected by shrinkage. It is ths most Economical Bridgs built. It is adapted to any practicabls LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridgs, and no charge mads unless the Plan is nsed. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low ratee.

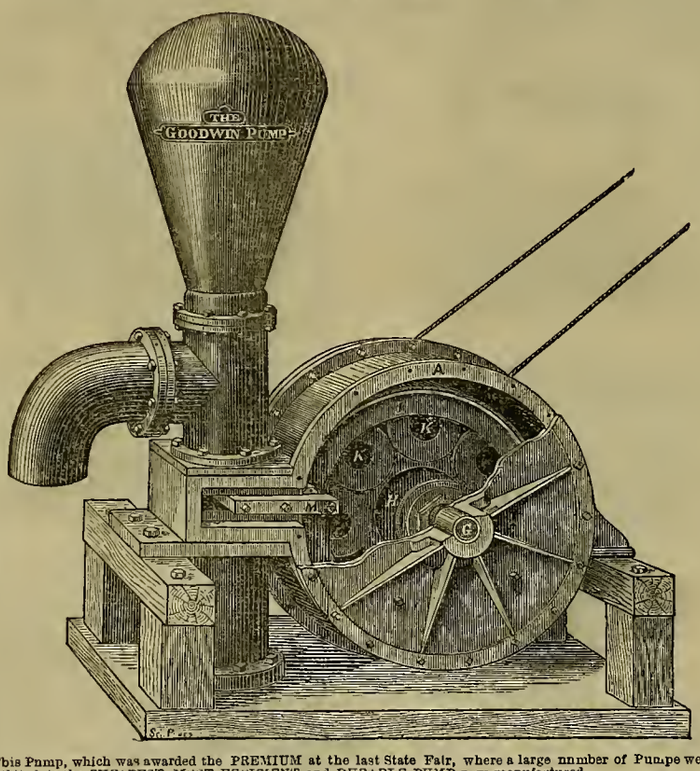
THE GOODWIN PUMP.



Tbis Pnmp, which was awarded the PREMIUM at the last State Fair, where a large nnmber of Pumps were exhibited, is the CHEAPEST, MOST EFFICIENT and DURABLE PUMP now manufactured.

We are rapidly increasing our Patterns and extending our facilities for manufacturing, but bave not yet been able to fully eupply the demand. As our Pump has no valves, it is the bset Pump for mines wbere water containing sand or sediment, or where bot liquids have to he pumped.

It is Unsurpassed for Hydraulic Mining,

And will throw a stream of from two to six hundred inchee of water with a force equal to a fall of two hnndred and fif y feet. It is peculiarly adapted to windmills for irrigating, or domestic purposes, and is equally as efficient and noiseless at a high or low speed, the water raised being in the ratio of its revolutions. Our large irrigating Pumps will throw twenty thousand gallons per minute.

LIGHT FROM THE WEST.—The spirit of progress has somewhat upset our old notions on the subject of light. We used to look to the East for knowledge in the arts, sciences, religion and everything else. We were accustomed to receive all good things from the Orient and all evil things as well. Plagues and contagious diseases, as well as literature and science, followed the course of the sun, and came to us from Europe and Asia. But lately we are reversing this order of things, for here comes to us from San Francisco the SCIENTIFIC PRESS, one of the very best papers of its kind in the world—fully up in the latest discoveries and inventions, and altogether a most valuable and ably conducted journal. —[Industrial Age, St. Louis.

"Full of Practical Information."

DEWEY & CO.:—Your paper (the RURAL) is all it claims to be—full of practical information and useful knowledge to every farmer. I remain, yours most respectfully, W. H. P.

"Glad to See It a Success."

SAN JOSE FOUNDRY, SAN JOSE, Oct. 22, 1872.—MESSRS. DEWEY, & CO., 338 Montgomery street, San Francisco.—Dear Sirs:—Enclosed herewith you will find Post Office order for both SCIENTIFIC and RURAL PRESS. I am glad to see the RURAL PRESS has proved such a success, and I hope it is as great a benefit to its owners financially as it is to its readers instructively. Yours truly, D. McK.

☞ SEND BY LETTER, AND GIVE YOUR NAME AND P. O. ADDRESS, when you wish this paper stopped, if it is continued beyond the time paid for, as sometimes happens through request of agents or other parties. Returning the paper, telling the P. M. you will not take it, is not sufficient notice. Parties requested to notify us, frequently fail to do so. Papers sent back are liable to miscarry. Without your address with your name we might have to look over near 10,000 a mee before finding yours, to erose off. We do not intend to send the paper to a single person who does not desire it, and in case of mistake, will thank any subscriber to inform us. bptf

MARAVILLA COCOA.—No breakfast table is complete witbout this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved uotil Messrs. Taylor Broth rs discovered the extraordinary quali ies of 'Maravilla' Cocoa. Adapting their perfect system of properatiou to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For Homœopaths and Invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brotbers' Original Homœopatbic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium.

THE PORTABLE SAFETY GAS LIGHT, noticed in last week's issue, can be seen at 608 Clay street, in this city. P. J. PHILLIPS & Co., Agents.

San Francisco Co-operative Printing

Company.—Location: 411 Clay and 412 Commercial Sts., San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of the San Francisco Co operative Printing Company, held on the 5th day of November, 1872, assessment No. 4, levied on the 17th day of September, 1872, of $12 per share, having been rescinded, on same day, an assessment of Five Dollars per share was levied on the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, 412 Commercial street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Monday, the 9th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 31st day of December, 1872, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

B. H. DAILY, Secretary.
Office 411 Clay St. and 412 Commercial St., San Francisco, Cal.

State of Maine Mill and Mining Company

—Location of mine, Amador County, California.

NOTICE is hereby given that at a meeting of the Board of Trustees of said Company, held on the 17th day of October, 1872, an assessment of five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 305 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 26th day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

oc26-4t H. B. CONGDON, Secretary.
Office, No. 306 Montgomery street, San Francisco, Cal.

The North San Francisco Homestead

and Railroad Association. Location of property: City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of Nov., 1872, an assessment of Three Dollars per share, was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 314 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid, on the sixth day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. D. SMITH, Secretary.
Office, 314 California street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,

ONE DOLLAR A YEAR

—FOR THE—

PACIFIC COAST MERCANTILE DIRECTOR

This is a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain reading of interest and importance to all business and professional men on the coast.

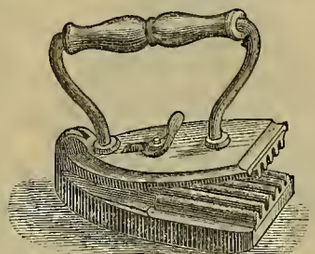
OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Produce Markets; Rates of Freight and Passenger Fares—corrected monthly; Illustratione and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provision;" "Dry Goods;" "Trades and Manufactures," etc., etc.

Our first issue for May consists of 24 pages, embracing FORTY-FIVE COLUMNS of important reading matter—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

Published by MURRAY, DEWEY & CO.,
At the Publishing Office of the Mining and Scientific ress and Pacific Rural Press, San Francisco.

Polishing and Fluting Iron.



This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for Fluting is made of brass, and highly polished. The Polishing Iron and Fluter, being in one, are both heated at the same time.

We are now prepared to furnish them in quantities to suit.

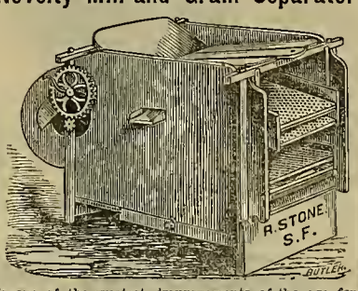
THE PATENT Novelty Mill and Grain Separator

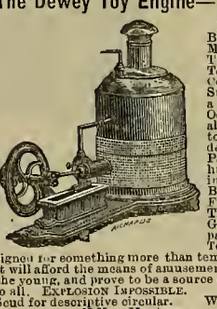


Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE.
eow-bp 422 Battery street, San Francisco.

TOYS.

The Dewey Toy Engine—Patent Secured.



NOVELTY COMBINED WITH AMUSEMENT AND INSTRUCTION. Most Ingenious Toy of the Nineteenth Century. A Genuine Steam Working Engine, a Model of its Style, Complete and Perfect in all its Parts. Adapted to the wants of the Student, School-Room, and Parlor. This is not a humbug, but is a genuine Steam Engine, with Boiler, Cylinder, Piston, Fly-wheel, Safety and Throttle Valve, and a Grooved Pulley for imparting motion to other Toys. This Engine is designed for something more than temporary amusement, as it will afford the means of amusement for the old as well as the young, and prove to be a source of pleasure and profit to all. EXPLOSION IMPOSSIBLE.

SAN FRANCISCO, SATURDAY, NOVEMBER 16, 1872.

VOLUME XXV. Number 20.

The Great Fire in Boston.

Tho metropolis of New England has just euffered a desolation from fire, that if not equal in extent to tho great Chicago fire, hae consumed the very bueiness heart of the city, and with it more staple and valuable merchandise than could have been encircled within limits of the eame extent probably in any city in the Union.

The blackened ruins cover 60 acres in extent, whilst the losees are eetimated to be between two hundred millione and three hundred millione of dollars; thns exceeding the losses by the Chicago fire. It ie a ead calamity, and even though the numbers of people in the lower and middle walke of life that have been rendered houeeless, and deeolate in prospect and purse, just ae the etern northeaetern winter ie eetting in, may not be as great as at Chicago a year ago, still enough are eufferers to command our eympathiee and material aid.

With many thousand hearts it turns the usual New England holiday into a very eorrowful Thankegiving; and many a feetive board, that but for this event would have played an important part in the ecenes of the in-gathering of happy householde, may now be less bouutifully eupplied, and the re-union of kindred deferred to a time further removed from the preeent heart paine incident to this dire calamity.

Life Insurance Forfeitures.

The *Morning Call* recently intimated that the life-ineurance bueinees was epecially profitable on this Coaet, owing to the unusually large number of forfeitnree of policies here by thoee who, after ineuring from one to eeveral yeare, ceaeing payment. Poeeibly the *Call* is correct in a measure. But it is the fault of the insured, through ignorance or negligence, if the companiee are thne making large sume. The public should know that every first-claee company repreeented in San Francisco providee for ieeuing a paid-up policy for any over-paid ineurance. For inetance, if a young man ineures his life, he pays the same rates annnally while yonng ae when older. The risk, however, is not rated eo high for the firet yeare of his ineurance ae in his later yeare. Coneequently, he pays more ineurance during the firet yeare than the riek demande. But whatever thie difference may be during the years for which the paye iusurance, if he faile to continue, the companiee offer to give him a paid-up policy. If the ineured appliee for it, the company gaine nothing extra by the diecontiuuance. If he faile to ask for it, it would eeem to be his own fault. These facte, we believe, ehould be more generally understood, for the benefit of the insured and the popularity of the ineurers.

THE EMMA MINE SUIT.—The famous trespase euit of the Emma Mining Company vs the Illinoie Tunnel has been decided in favor of the plaintiff, with nominal damagee of $5,000. It wae generally underetood that the case had been compromieed before the deciaion, and that the Emma Company had bought the Tunnel. We notice that our friend Mr. Henry Sewell wae on the etand ae an expert, and some eharp paesages occurred between him and one of the defendant'e counecl, in which the latter ie eaid to have come off second best. The iseue of this case involved a large amount, but thie decision practically settles the whole question of title. Notice of an appeal has, however, been given.

SAFETY CAOE.—A new eafety-cage for mining purposee has been invented by a blacksmith named Duncan McDonald, in the Overman mine. It is said to have great superiority over the common cages in use.

An Improved Self-Coupler for Cars.

Numerous inventions have been brought before the public eince the era of railroade for coupling cars, and a few of them iutended as self-couplers, deeigned to obviate the neceesity of a man going between the cars. One of the most practical and moet recent of theee improvements ie the one shown in the accompanying cuts, the eimplicity and efficieney of which will be apparent as eoon as the device is nnderetood.

Fig. 1 ie a perepective view with a portion broken away, ehowing the interior. *Fig.* 2 represents a section. *B* is a elotted bar which moves vertically up and down in the rear part of the bumper. *A*, the upper part of this bar extende forward at right anglee with the vertical portion and eervee as the pin-holder. *C* is an arm keyed to the horizontal shaft *D*, which paesee through the bumper in the rear of the bar *B*, as ehown. This arm is forked eo that ite branches stand at nearly right angles in the form of a bell-crank. The upper portion serves to euetain the bar *B*, and the pin where it ie raised for the admieeion of the link. When the bar and the pin are raised to admit the link the lower part stands horizontally, ite end juet entering the rear part in the link opening in the bumper head and being beveled or curved eo that when the link strikes it, it will dieengage or trip the upper arm and thus allow the bar *B* to fall, carrying with it the pin *E*, which passes through the link and detains it in position. The end of the ehaft *D*, may be bent at right anglee as ehown in *Fig.* 1 and weighted so as to cauee the arm *C*, to turn readily when released.

Fig. I.

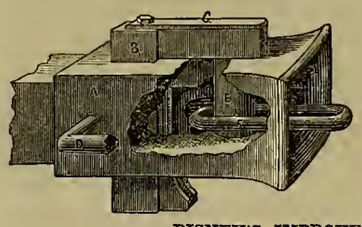

Fig. II.

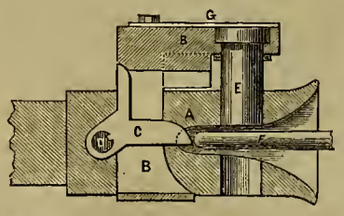

DISNEY'S IMPROVED SELF CAR-COUPLER.

When the bar *B* deecends, carrying pin *E*, through the link *F*, the bell-crank arm, *C*, will be turned so that its upper arm extende horizontally, while the lower one will be in a nearly vertical position, its lower end resting on the bottom of the slot in the bar, *B*, and locking it eecurely, thus preventing any jar from raising it and throwing the pin out of the link. The pin may be of any ordinary description and ite head dropped into a countersink in the horizontal portion of the bar *B*. The plate *G* ie arranged to turn over the head of the bolt which prevents the bolt from being jolted out, and can at any time be turned to one side for the purpose of removing the bolt or substituting a new one.

This self-coupler hae been exhibited to but few intereeted in railroads, and the exhibition and practical workinge have been made but lately. All who have witnessed the effect of the eaee with which a car can be coupled and uncoupled have expreseed themselves well pleased with ite eimplicity. The first reeult of the patent being made public ie that the Nevada Central Company have directed that additional care, now in proceee of construction for them, be fitted with this apparatus. When the link is forced in, it does not press anything excepting the eolid iron of the bumper, not being in contact with the lower part of the bell-crank at all.

The conetruction of the device ie simple, no springs or intricate machinery being employed. No neceeeity exists for the removal or change of the old coupling or bumper in attaching this, and, in caee the self-coupler should be disarranged, which is not probable, the old one can be ueed immediately; the pin employed, either round or square, being euitable for either kind of coupling. It can be placed on any car, paesenger or freight, at slight expense and ensures perfect eafety ae it forms a lock which, when coupled, no wroneh can unlock, but which the elightest touch of those who control the train can disengage so as to operate on any particular car. A chain on top of a box-car will enable a man to nncouple any car in the train from the top of the car. For railroad and mining companies who uee car trains in their buineee thie device will be of great use and will tend to decrease in a wonderful degree the number of accidente on railroads. With this device and the air breake in uee, paesengere will feel much more eecure on a grade, and railroad employée will have less cause for ineuring tbeir lives.

Thie conpling is the invention of Mr. M. Dieney, a Californian, whose former ingenious inventions we have before mentioned.

A full eized coupling can be eeen at No. 111 Leidesdorf etreet, at the Riedon Iron and Locomotive works, corner of Beale and Howard etreete, in this city, or at the Kimball Carriage Factory on Fourth street. For further particulars addreee H. C. Kibbe, 419 California etreet, in this city.

VIENNA EXPOSITION.—The Kimball Manufacturing Company of this city have forwarded one of their wood C spring buggiee for exbibition at the Vienna Exposition. They are building other vehiclee which they propose to forward ae eoon ae completed. We are pleaeed to eee one California firm, at least, alive to the benefite to be derived from this expoeition, and hope that others will follow their example and have our State well represented. Our articlee of manufacture, though limited in variety, ae yet, are of superior quality and their excellence will no doubt eurprise many who will vieit the exposition who aro not awaro of the great progrese the State hae made in the limited time since its settlement. The inducemente held out by those having charge of the exposition are very advantagoone and the benefite to be derived from the exhibition of our manufactured articles are many.

MINEE SOLD.—The Alpine *Chronicle* etatee that the Exchequer Company have purchased the Saugatuck and Fremont mines, adjoining the Excheqner, and that hoisting works are heing erected on the Saugatuck from which both minee can be worked.

Cleaning of Iron-Amalgam.

[Written for the PRESS by G. Kustel.]

In working roaeted eilver ores it sometimee occure that, under certain not yet explained conditions, the iron enters the amalgam, when amalgamated in iron pans, to a very disagreeable proportion, making the cleaning very troubleeome, or, in the usual way, imposeible. It seeme that the iron doee not come from the ore, but from ehoee and dies of the pan; otherwiee it could not be explained why no iron-amalgam is obtained from the barrel-amalgamation, at leaet, never to euch an extent as to form infusible iron lumps in the crucible when the retorted amalgam ie eubjected to melting. It separates then from the silver but retaine up to 60 per cent. and over, of the latter. It ie eingular this amalgam is not often formed in pane in epite of grinding. Artificially, that ie, adding experimentally to nnroasted eilver ore chloridee or snbchlorides of different metals, no iron-amalgam will reeult; on the other hand euch amalgam ie obtained from amalgamating raw gold oree. The amalgam is very magnetic, and the iron only looeely combined with the quicksilver, so that a mechauical treatment, rubbing or grinding, is sufficient to separate the iron from the quickeilver. Thie, however, ie eo slow that no practical nse can be made of it.

The different waye of treatment I will not mention here except one method that I ueed with the best euccees; it is cheap, quick and perfect. A flat-bottomed pan like Knox'e, is put in motion without any water in it, and a bucketful of eifted ashes introduced. The well-etrained amalgam is then thrown in gradually piece by piece, in proportion aa it turns into powder. If the mixture aeeumee a dark color or if the pulverization of the amalgam commences to go elow, another bncketful of aehee ie added, and so on until about 300 pounde are pulverized, which ie effected in about half an hour. The gray heavy powder ie then taken out and another lot of 300 pounds of amalgam managed in the same way and so on till all amalgam at hand is worked np into powder. In caee the ashee are moiet, a reaction in the maee is obeerved by the increase of temperature to a considerable degree. After the mixing is finished, the powder is allowed to lay for an hour undieturbed, then eome water admitted into the pan eo as to cover the bottom about an inch deep. While the muller is in motion, the amalgam powder ie introduced by meane of a scoop till about 300 pounds are charged. Water ie added if neceesary, but not too much. Quicksilver ie generally not required, unlees the amalgam wae etrained very hard. After a while the amalgam becomee more liquid by loosing the iron, which blackena the water. After an hour'e grinding some amalgam ie taken out and examined. If not quite clean another hour will do. A quarter of an hour, before the discharge, more water and quicksilver is introduced—the quicksilver only for the purpose of eaeier diecharge. It ie not exactly necessary to work with chargee of 300 pounde, but with ae much as the pan can stand, without having the driving belt elip off.

I have had no experience ae to whether iron-amalgam has ever been obtained from amalgamation in pans where no grinding at all ie permitted. If the suppoeition is right that the iron comes from ehoee and dieeof the pan, then, if a certain kind of ore is inclined to form iron-amalgam, this could be prevented by omitting the grinding; but treating raw gold oree, the grinding ie indispeneable, and in this case, if iron-amalgam ie formed, an addition of aehee to the ore would likely keep the iron from entering the amalgam, as the aehes are the meane of eeparsting it. Treating eilver ores, thie laet remedy could not be ueed for the eame purpoee, ae too mnch of it would injure the amalgamation.

Pre-historic Remains in the Aleutian Islands.

At the last meeting of the California Academy of Sciencee W. H. Dall, of the U. S. Coast Surveoy, read the following paper on the subject of prshietoric rsmaine in Alaska. The report wae illustrated with mape and diagrams and was very intersting:

Captain's Bay, Analaska.

There are eeveral village eites on this hay which inhabited during the psriod suhsequent to the Russian occupation of the territory, are now, and long have heen dsserted. The principal are ths Postriakoff, or Elder villags, near Caps Cheerful; one on the south part of Amaknak Island, just south of Expedition Island, on Iliuliuk Harhor, and one in Nateckinsky Bay; besids the Kalekuta Bay village, mors recsntly evacuated hy its inhahitants. Ths only locality now inhahitsd are the village of Imagnss, on Summer Bay, the villags of Iliuliuk, and another, of two or three houess, on Uknadok or Hog Island.

In excavating for the erection of a signal, at the northern snd of Makata Spit, Amaknak Islaud, the naturs of the materiale brought out showsd that the locality had once heen inhahited Subseqnent inquiries elicited the fact thst the oldsst inhahitants of Iliuliuk had never heard of any village heing eituats here, although villags which wers deserted in the last century are well known hy tradition to the Alsuts of the present day. Hence it is a rsasonable snpposition that the village undsr consideration must at leaet have aute dated the Russian invasion of 1760, and may havs been oldsr. Hence, the implemeute, stc., fonnd in this deposit, ars in all probahility the same as those originally in uss among the natives of this region hefore ths introduction of manufacturad articlse of trade by civilized nations. On this account they are of singular interest. A careful examination of this locality afforded the following observatioue:

The Ulakhba Spit

Projects from Amaknak Island, treuding nearly in a north and south direction. It is very narrow, beiug in eome places only ssven meters wids, and is composed entirely of shingle overlaid by a stratum of vegetahls mould, which supports a lnxuriant growth of the nativs grassee. Near the junction of the spit with the main island, it rises, and is continued in a ssriss of low mounds for a quarter of a mils. Between thess mounds and ths mountainous portion of Amaknak, called Ulakhba Head, is a low and uarrow strip of ground containing a small pond of brackish water. The highest of these mounds is quite near the north hsad of the spit, and it was here that my signal was located.

Upon this mound, ahout twenty feet ahove high water-mark, by careful scrutiny, I was ahls to detect at least thrse depressions of considsrahls eize, which I judged to bs ths sites of

Houses of the Ancient Aleutian Fashion.

That is to eay, half underground of sufficient sizs to accommodate a nnmher of familiss, sach of which had a sort of compartment to itsslf. The hardy Aleuts had no firss in their houses exccpt for cooking, and this wae often done outside. They dsscended on a uotched stick, through an aperturs iu the middle of the roof, which was also ths only window. Thsse depressions appeared to me to he the remains of soms of thess housee, a supposition afterwards confirmed hy onr excavations.

In digging ths hole for ths eignal we got two stons lamps for hurning ssal oil, about as desp as a saucer, and of an egg-oval shape, exactly similar to some I havs seen in use among the present Esquimaux of Behriug straits. They were of soft porphyritic rock and still retained traces of the action of fire. Whsn used, thsy were filled with dried sphagnnm soaked in seal oil, which gives out considerahls light and heat, as well as smoke. Ws also ohtained a bons arrowhead of the Esquimaux pattern from this excavation. The next tims that we visited the station, while husy in taking trigonometrical ohservations, I directed the crew to dig in the northwest coruer of what I supposed to he the remains of a house or yourt. This depression was on the crest of the ridge facing east and wsst, ths longer sides about forty fset long and ths ends about twenty feet.

The first noticsd was a sort of wall of rough etones evidently ohtained from the neighhoring beach, with here and there a whale-rih, in a perpendicular position, which had probably aasisted in supporting the roof. Further excavatiou for a couple of feet revealed

A Human Skeleton in Perfect Preservation.

The hody had heen donbled up so aa to bring the knees up to the chin. It waa lying on the right aide in a horizontal plane facing the southeast. Two others were afterwards discovered iu an exactly similar poeition. They were ahout three feet from the eurface hut not ao far from the inner wall of the house, one waa the ekeleton of a woman. A few rough flat stonea were placed aronnd aud uuder them, but uo articlea of use or ornament were with the akeletons. It ia a mattsr of record that the ancient Aleuts, when a person died in one of their houses, huilt up the body in the compartment which had belonged to the person when living, and continued to occupy the remainder of the yourt ae nsual. The position in which thsae ekeletone were found, indic ates that euch was the manner in which they had heen interred. It is still a common practics among tribes of the Ovarian stock, to tie np the body of a dead person in the manner just deecribed. Further digging sbowed that a great part of the mound was composed of materials foreign to ths locality. Theee principally consistad of honee of cstaceous, fur eeal, (*Callorhinus ursinus*) eea lion (*Eumetopias Skelleri*) and sea birds, principally ducke and gulle or pstrels. There were aleo large accumulations of ths shells of edihle mollusks, among the most conspicuous of which were the common mussel, (*mytilus edulis*), *Saxidonius squeatidus*, Dest. *Tapes staminea*, com. and *modiola modiolus* L. All ths ahove are still living in theee seas, most of them are still found in Captaiu's Bay, and form a portion of the food of the existing native population. The sea-lion and walrus are no longer found in Unalaska, and ths fur-ssal hut rarely. That they must have heen very abundant at one tims is evident from the great accumulation of their bones in this single mound, which was literally compoeed of such debris, arranged in laysrs separated hy vegetahle moulds. From thsse matsrials we picked out a nnmher of

Articles of Interest.

These were principally stone lamps, like those previously described, of various sizes, dlfferent in form and nicety of finish, to soms extent. Besides theee thers were also many large, rough stonss, sither naturally or artificially hollowed out on one eide, which had been enhjected to ths action of fire, and were probahly the pavement or hearth upon which fire had hsen huilt for culinary purposee. Several rongh pieces of cetscean hone were found brought to a sharp, square edge at one end, and formerly in use for dressing ekine. A fsw stone knivee were found, all of the native pattsrn, *i. e.*, shaped like the chopping-knife. These were of a fine, dark slate-stone, which must have been hrougbt from a locality nearer to the mainland of America, as it is not found iu Unalaska, or the islands west of it as far as known. Also a large part of a flat spoon of carved bone, with a groovsd handle, eevsral awls, usually mads from the wing-bonee of hirds, hone arrowheads of Esqnimaux pattern, fragmente of hones variously groovsd, cut or carved, and a little hall of bone half perforated. This puzzled me for a long tims, uutil an old Alsut informed me that, in his boyhood, hs had seen such things used as buttons, to be put on the end of a hone-lance or arrow, when practising at a mark, in order that ths point might uot hecoms hlunted, or injnred. None of thess articles exhibited any particular skill in carving or any ornamental pattsrns excspt of straight lines. A number of chipped flints, which had evidently been ueed in striking firs wcre also fonnd.

Further explorations made during tho eneuing winter and spring, rsvealed

The Sites of Sevon Villages

On Omaknak Island alons, of which hut one or two ars known, evsn by tradition. Excavations in one or two of thess placoe revealed similar implsmsnts to those already descrihed, others might douhtless have turned up, but my means and time wers too limited to psrmit very extensive excavations. I was ahle, however, to detect two other

Modes of Burial Among these Pre-Historic Natives.

In csrtaiu places at the foot of overhanging cliffs a wall had heen built up until ths rock above was reached, and outside a hank of earth covered this wall. In ths space inside ths dehris had thsn heen removed, and in this space, on a layer of emall sticks of drift wood, the hodies had heen laid, one ahovs the other. In one caee I found six skeletons, ono ahove the other, eeparated only by the layers of sticks and a piece of grass matting eimilar to that still mannfactured hy ths natives of Unalaska. Here again I noticed the remarkahls absencs of any utensils or articles of apparel or ornament. Only one bone arrow-head, with a piece of iteshaft and a fragment of a wooden mask, were found during the examination of some four or five of thess caves, crammed with remsins of skeletons. The bones were much decayed whsrever water, percolatiug through ths rocks, had hsen able to reach them, hut where they were dry they were well preserved. The only anatomical peculiarity of ths bonee, which agreed, in all essential respects, with Esqnimaux remains of similar character, was the great stoutness of the long bones and a remarkahls thickening of the inner face of the under jaw, which was eo extensive, in a majority of cases, as to nearly close the epace between the two halves of the the jaw, the hone heing over an inch in diameter in aeveral casee.

A emall cave exiats, nuder an isolated rock which atands on one of the raised benchee on the middle portion of the islaud. The entrance ia very low, but inside one can atand erect, the cave being about twenty feet in diameter, but of au oval form, the highest point of the dome-shaped roof being ahout ten feet above the floor. A good deal of water had penetrated through the crevicea of the rock, and the bones in this cave were very much decayed. I remarked

Remains of Seven Skeletons,

Arranged around the edges of the cave, that at the extremity of the cave furtheet from the entrance, heing the akeleton of a woman, and close to it the remains of an infant. The floor conaisted of about aix inches of hlack mould, covering the usual ehingle of the beachea. A number of angular fragmente of rock had fallen from above. No remaine of animals were found here, and if thers had been any wooden articles, thsy had all rotted away.

Near one of the skeletons was found, heaped together, a nnmher of stons knives, a bone awl, and two fragments, oue of pumics and ths other of fins sandstone, with their edges and surfaces smoothed and squared evidently for ths purpose of dressing down ths asperitiee of skins to be ueed for clothing. Tho most interesting collection was found near ths skeletou of the woman, and consistsd of two bons lahrets shaped like thoss now in use among the Thlinkete and Botocudos. These are doubtlsss very aucient, as all traces of the usage have long since passed away. Thers were hesidee, a lot of nsedles mado of the wing hones of hirds, a nsedle case made of the humeras of some large hird, closed at each end by a wooden stopper, bons awls, stone knives, a whetstons of fine grained sand rock, and a littls case of hirch hark containing plumhago. Neither ths birch, the sandstone nor the hlack slate of which the knives were made, nor the plumhago, exist on the island of Unalaska.

As proved by othsr researches on the islands of Kadiac and Unga, the early Aleuts were accuetomsd to preserve the rsmains of their more eminent dead by removing the viscera, stuffing ths hody with dry grass and drying it. This was placsd iu eome dry cave,

Dressed as in Life,

Ornamentsd with gay apparel, aud covered with wooden carvings, ths most remarkahle of which were masks of large sizs, paintsd of different colors aud ornamented with feathers, tufts of hair and brietles from the dcer. A very great varisty of othsr carvings were also placed in thsse caves, and sometimes the hodies, placed in natural attitudes, wers covered entirely with carved wooden armor, or placed in a miniature canoe or bidarka, armed as if huntiug, or holding a paddls. Women wers repressnted as if sewing, dreeeing skins or nursing their iufants. Old men as if beating their drums, as they do during the wintsrdances in Esquimaux villagee to this day.

But few of thsse remains exist iu a wsll prsserved condition, yet the extent of ths practice may be understood from the fact that ovsr thirty different masks, all more or lees mutilated, were found in ons cavs at Unga. Any notes in regard to them, possese a certain interest, and may bs worthy of pressrvation, ae hefors many years havs gone hy, evsu the traces of thsse by-gone customs will have entirely disappeared.

Richmond Consolidated Mining Company (Limiten).—The following information respecting the working of ths mine for thres months has heen receivsd from ths manager hy the *Mining and Commercial Times*, of London:—June—tons smelted, 1,641; hullion produced, $86,112; yield per ton, $52.28. July—tons smelted, 1,117; bullion produced, $58,581; yield psr ton, $50.16. August—tons smelted, 1,134; bullion produced, $60,520; yield per ton, $53.36. Total for three months—tons smelted, 3,892; bullion produced, $205,213; average yield per ton, $52.72. The ore smclted dnring August was therefore richer than at any time sincs Septsmhsr, 1871, as is likewies ths averags of yield since June 1, eay $52.72 per ton. The ore now in sight in the mine is fully up to the ahovs high grade, and, unlsss ths character of the ore should change conseirahly with further explorations, we may expect an avsrage yield of $50 per ton. Unless we havs an average monthly product of $80,000, I shall bs much disappointed—eay a gross hullion product of a million dollars per annum. The result of the emelting for June—$86,112—has already proved what may bs reasouably expected for ths future. Yesterday I let a contract to sink the engine shaft 100 feet deeper. The Lizette tunnel is progrsssing finely at ths rate of two feet or mors daily." Copy of cahle recsived this day: "Hall, London.—Last week, five days' ruu, smelted 176 tons. Produced $9,900. Fisher."—Yours, etc., Thos. Westbury Hall, Secretary.

The New Atlantic Cable.—A London letter says of the next Atlsntic cahle, soon to bs lsid: In addition to the prssent three marine cahlss, a fourth is in processs of rapid construction and embarkation on board the "Great Easteru." Thie new cable is a duplicate of ths French one, and is to have its tsrmini at Land's End and Halifax. Its main length will bs 3,600 miles, and it will cost, lees the laying down, £1,200,000 and upward. It is heing placed on hoard the "Great Eastern" in lengths of 250 mile coils. Already a large portion is on hoard, and early in the coming ycar it is contemplated to put it in use. The experience of the past haa given eome important leesons on the conatruction of thia cable, and every approved and new feature that haa heen suhmitted by electricians and engineers has met investigation and adoption. The machinery for submerging and laying is also improved, and marine cable-laying ia now a thing of ease and energy only. The London Construction and Maintenance Company, with ita immense capital, and net profits of last year amounting to £115,500, and having a mouopoly, finds it a very easy thing to lay Anglo-American cahles. The next thing expected is a reduction in the rates of messages.

Artificial Manures.—English farmers use nearly a million tons of artificial and chemical manures annually, the materials for which are drawn from all quartera of the globe. It is thus they raise their hsavy crops and keep their aoils improving.

Butte County Mines.

One of our correspondents sends us a few itsms of intsrest from Butte County, from which we maks some extracts. Hs thiuks that Moraie Rayins is the outlet to Tahle Mountain, as it has a splendid fall and emptiss to ths Feather river. Travslers thst wish to sss minee worked in an sxtsnsivs scals, would do well to visit Cherokee Flat and Morris Ravine. The mines arouud Oroville are being made ready for the winter.

The Golden Summit Silver Mine.

Thie ledge was discovered one year ago in Kineshew mouutains in the north-eastern portion of Butte county, and promises to be the most valuahle mine yet discovered in the county. The ledge is from 3 to 8 feet thick, and assays largely in silver, with some gold. It has heen found to bs a bold promineut ledgs for a distance of 8 milss, bearing strong silver indications ths whole distauce. Abont 3 tons of the ore has hsen taken from tbe ledge in one plaes, and shipped to San Francisco, and found to be worth by actual tsst of mill process about $100 per ton. Many locatione are being made on the ledge. Ths opinion of experienced miners is that the ledgs is a valuahle one, and that this section is destined to hs one of the richest miuing camps in ths Stats.

Hendricks Mine.

This property ie located in Morris Ravine, 3 miles north of Orovills. Ths company have just complsted a large ditch or canal from the wsst hranch of Feather river to their mine, a distance of fifty miles. Iu about two more weoks they will have completed a tail flums 6 ft. wids by 3 dsep, aud over a mile long. They expect to continue it to the rise, and immediately on completion of this one, lay another aloug sids.

They have a fius fall from the claim to the main Feather river, a distanes of 1½ miles. When they gst their flumee to the river they will have a dump for all time. They are now takiug steps to procure title to their valuahls mining property. The company is an Indianapolis one, T. A. Hendricks being one of the company. They have so far expended ou ditches and improvemeuts on the mine $300,000.

Naturs has done wonders for this claim. It is supposed to be one unbroken gravel deposit to Cherokee, through Table Mountain, a distance of four miles. You find here the hlue gravel aud rotten houlder deposits, similar to the far famed Cherokee deposits. They ars working on an ascending hed-rock.

The Nisbet Mine

Is situated at Oregon City, Butte County, Califoruia. Ths vein is from two to four feet thick and dips 45° to ths westward. Ths casings are slats and green-stone; depth of workings 120 feet; extent of claim, 3,600 feet. The total yield from this mine up to last month was $130,000. Ths average yield of the work was $25 per ton for the first 50 or 60 feet in decomposed rock. Below ths water level ths rock averaged $35 psr ton. The ore is treated in a new 16-stamp mill, erected on the site of an 8 stamp mill hurnt last eeason.

The Yuba Gravel Mining Company.

Ths Yuba Gravel Miuing Company is a corporation orgsnized for ths purposo of opening the ancieut river-bed or gravel channel above ths town of North Bloomfisld, Cal. Ths theory was first advancsd by Professor Whitney, that ths rich channel which passee through and has heen opeued at Forest City, Alleghany, Miunssota and other pointe in Sierra county, came into this county in Eureka towuship. It is also a theory of practical miners that the same channel runs from Snow Point to Orleans, Moors's and Woolsey's Flats in this county, and then passss through to Bloomfield, uuiting ahove with the channel from Relief Hill, and ths Yuba claims, consisting of about 604 acres, are located at or near the point of union of the two channels. The channel has been openod at Moors's and Woolssy's at one angle, at Bloomfield another, and at Relief Hill another angls, from ths claims of the Yuba Company. The mines at Relief Hill have heen recently worked hy drifting, and havs yisided as high ae from $47 to $50 psr day to the hand, as we are informed.

The Moore's and Woolsey's Flat mines ars yielding large returne, and at Bloomfield, where the channel was reached, splendid gravel prospects were found. Theae developmeuts iudicate that the Yuha gravel Company have a splendid location upon the channel, and thus far the developments show a formation similar to that of the Relief Hill. The company has now excellent and powerful machiuery, consisting of a thirty-horse-power engine and a pump that will raise 26 inchea of water. The ahaft is down 180 fect, and of this distance 6 to 8 feet ia in gravel which prospects well. The first machiuery used was not of aufficient power, hut now everything is of the most substantial character and in thorough order. A tram-road is now heing built to run wood, abundance of which ie in the immediate vicinity, to the worke. The mine ia under the auperintendence of D. R. McKillican, of North Bloomfield. It is easy of acceas, and is ahout two milea from town. We hope soon to he ahle to announce that bed-rock aud big pay have been found in the channel. The indications, the location and alldevelopmente in the vicinity are most encouraging.—*Transcript.*

MECHANICAL PROGRESS.

Carriage Wheels—Where is the Weak Point?

It would seem that after many experiments made and the long controversy that bas been going on for years in regard to wheels, there would be no necessity for asking ths above question, hut having never yst heard what wo dosmed a satisfactory answer, we havo taken extra pains to ascertain, if possibls, whether the theories npon which tho trade is constructiug wbeels at ths present tims ars right or not. Just one year ago we chanced to eeo a wheel hreak down, and we noticed that the spokee hroke off near the hub, hut not a single teuon was drawn out; we accordingly made a note of this, and for one year have been on the lookout for hroken wheels. In our pursuit of information we have not always found oursclvee in pleasant company, but eee the wheels we did, and our diary showe a record of forty broken wheels and their appearance. Among them we find almost every class, from the light wheol with its three-fourthe inch spoke to the heavy truck wheel with is two and three-fonrths inch epokee; wheels high and low, new and old, hroken by collision, turning out of railroad tracke and other cansee, in three instences the wheels hreaking down on smooth roads without any perceptible cause other than the weight of the vehicle.

On the whole number broken we find that twelve broke in the aame manner as the firet one we noticed—the spokea breaking off near the hub, but withont drawing a tenon; in six casee these epokes were drawn out of the hnb and all the rest broken not short off in all caeee, but twisted and split so as to retain no eupporting power. In three more cases four apokee were drawn from the hubs and the others hroken; in two casee every spoke was drawn from the hub; in five oasee the spoke broke at the felloe, and those on the under side were orushed down; in six cases the spokes on the nnderside of the hub were broken off near the hub, and a portion of those above the hub were broken at the felloe, but none were drawn from the hub; in four casss the wheel dished back and broke nearly all the epokes, but starting only two or three in each case from the mortiee; in the remaing two cases the wheel dished hack aud drew all the epokes, breaking a majority of them also.

But our examination did not stop here. We fonnd that of the twelve wheels that had all of the epokes hroken, in but one instance were the spokes over one inch or the hub over four inchee in diameter, and, with the exception of three hubs, they were under three and one-half inches in diameter; in the eix casee where these epokes were drawn out of each wheel, in all but one the spokes were over one inch, and the hubs not less than four inches in diameter; in one instance the spokes were three-fourths inch, and the hub three inchee in diameter; in the case where four spokes were drawn they were one inch spokee and four inch hubs; in the two cases where every spoke was drawn or eo etarted as to be easily taken out, the epokes were two and one-half inches and the hub eight inchee in diameter; in the five cases where the epokes broke at the felloe, the spokes were over two inches, and the felloee were eawed; in the six cases where the epokes on the under eide were hroken off at the hub and those on the upper eide at the felloe, the spokes were one inch and under; in the four cases where the wheels dished back and broke the mejority of the spokee, the spokes were under one and one-fourth inches; in the last case where the wheels dished back and drsw as well ae broke the spokes, the wheels were of the heaviest kind, ench as are ueed on the four horee expresses

Ae a reeult of these observations, we find that the epokes that were drawn were drawn from large hubs, the spokes being of the heavier kinde, and in every instance they were of white oak; and that those spokee that were broken were of the lighter sizes and in small hubs; eo uniformly was this case that in every small hnb the spokee were broken without even starting the teuon, except where the spoke aplit lengthwiae, and in that case a portion of the spoke was drawn out. Another point noticed was that every wheel that broke at the rim was made with sawed felloes.

Our wheel manufacturers have for years been aiming to obtain greater holding power at the hub without increasing ita weight or aize; this haa brought out the iron and iron and wood hub combined. Now, they have beeu working in the right direction. If the three inch hub will hold the three-fourth apoke, notwithstanding the spoke may be split in alivors from one end to the other, as we often noticed it to be, what need is there of enlarging the size of the hub or increasing its power to hold the spoke, and this, too, in face of the fact that the only wheels from which the spokes were all drawn or atarted so aa to permit their being taken out eaaily, were large apokea in largsr hubs. We are unable to reconcile the theory that there must be greater strength at the hub in order to aecure a perfect wheel with the resulta of our investigations, and are more than ever ready to believe that time spent in working to increase the size, or, rather the holding power of the hnh is in a great measure wasted.—*Carriage Journal.*

Selenitio Mortar.

At the recent meeting of tho British Association, a paper was read showing the importance of the discovery of Gensral H. Y. D. Scott, whereby a speciss of limestonc, hitherto considered almost useless, is rendered valuahlo in ths manufacture of cements and mortars.

General Scott was the first to ohserve, about sixteen ycars ago, that a limestono, which does not possess to any useful extent, if at all, ths charactors essential to its conversion by burning into a hydraulic limo, may he made to furnish a good cement by simply allowing a small proportion of eulpburous acid gas (obtained hy burning sulphur or other well known methods) to pase into the kiln during the burning of the lime. The latter, when euhjected to this slight modification of the ordinary kiln treatment, (inetead of slacking or combining rapidly with water, with considerahle evolution of heat,) undergoee only gradual hydration, nuattended by any important elevation of temperature, and sets or hardene after a time, hehaving, in fact, in every way like a cemeut of good quality, and sometimee equaling Portland cement in etrength.

The production of the so-called Scott's cement, by this simple modification of the lime-burning procese, has been carried on to some extent for a number of yeare, and a medal was awarded to Colonel Scott in 1862 for its invention; but some practical difficulties attended the prodnction of nniform reeults, and these appear to have retarded any very considerable adoption of this method of manufacturing cement. It was found that in lime eo treated a small proportion of calcium eulphate, seldom exceeding five per cent. and frequently below that proportion, was formed; and that an admixture of a corresponding quantity of a soluble sulphate of eulphuric acid with the lime yielded eimilar reeults, but the difficulty of securing uniformity in the influence exerted by the eulphate upon the lime when employed in this mauner upon a scale of actual practice, precluded the attainment of succeseful practical reeults. By a most eimple modification in the mode of applying them, Geueral Scott has now brought the peculiar influence which sulphuric acid or a sulphate exerts, in preventing the heating and promoting the setting and hardening of lime, to bear with perfect eucces and uniformity upon lime of the ordinery kind used for mortar and plastering purposes.

The eulphuric acid or eulphate (which may be called the eelenitizing agent) is first mixed with the water to be ueed in making the plaeter or mortar, in the proportion correspondiug to about 5 per cent. of calcium eulphate upon the lime used. The lime is then added, and these ingredients are triturated together until they form a creamy paste, after which the paste is mixed with the requisite proportion of sand for the production of the quality of mortar required.

The invention is applicable to a variety of uses, but chiefly to the production of mortar for ordinary building purposes, to plaeter work, and to make concrete. It ie also adapted to brick-making, and the preparation of building-blocks of any size and in an ornamental form. The Messrs. Bodmer have eucceeded in producing with it bricke that are almost ae hard as marhle, and have facee of great beauty of texture and color. According to the proportion of sand employed in the mixture, either a very emooth surface or oue resembling that of a granuloue freestone but very much harder, can he obtained.

The Scott's cement and the selenitic mortar have been tested in a variety of ways and by different persous, as to their powere of resisting cruehing forces and teusile straine, and in all cases the resulte have been highly satisfactory.

The euperior adhesion of selenitic mortar to emooth surfacee was markedly shown in experiments made in comparison with Portland cemeut by bedding two flooring tilea croasways. After fourteen daya being allowed for setting, the reaistance of the Portland cement mixed with two parts sand to one of cement was 56 lbs., the cement in most cassa completely leaving oue of the tiles. On the other hand, the selenitic mortar gaged with five parts of sand to one of lime, when similarly tested, alwaya broke through the joint and resisted fracturing until weighted with 158 lhs. Thia is not the only application in which selenitic mortar shows a superiority to Portland cement.

Selenitic mortar, in ordiuary dry brickwork, with four or five parts of sand and upwarda, will give greater atrength than Portlaud cement used under aimilar conditions.

STAINING VENEERS.—Difficulty is ofteu experienced in getting the coloring matter to penetrate the wood aufficiently. Thia may be obviated by soaking the wood for twenty-four hours in a aolution of caustic potash, and finally boiling them for half an hour

SCIENTIFIC PROGRESS.

An Important Nautical Invention.

The attention of tbe British Association was recently called to a vsry important and beautiful nautical invsntion hy Mr. W. Fronde.

Tho object of ths inventor was to produce an automatic apparatua which would record the rolling of a ehip in a seaway, and also register the slopes of waves and the general undulations of the ocean. The apparatus depends for its precision upon the simple principle that a plumb line, if its point of suspension bo near the ship's center of gravity, will be for tbe moment in equilihrinm if it occnpy the poeition the vessel would give it in still water, while its oscillatione will conform to the changee of the wave elope.

It consiste of a revolving cylinder covered with paper and turned by clock work, which causes it to receive the tracinge of several pens. One of these pens marks the time at equal succeesive intervals by an exact clock, while the instrument being placed at the center of gravity of the ship, records by a eecond pen the angles made at each moment by the ship—that is to say, her relative inclination, ae imparted by the billows of the sea. Another pen, actuated by a rocking arm kept level and pointing to the horizon, eimultaneously recorde the angles which the vessel makee with the horizon or her ahsolute inclinatione.

The invention has been fully tested and its fundamental principlee thoroughly verified by protracted nautical experiments. This eimple contrivance, while apparently useful only for developing the mechanical theory of a ship's rolling at sea, will doubtlees subeerve some of the moet practical purpoeee aud vital neceesities of the navigator. It ie well known that the compass deviations on ehipboard are materially affected hy the varioue motione of the ehip, as ehe heels to the port or starboard eide. Late experiments ae to the amount of compass deviation ehow conclusively that no good seaman can fsil to keep the rolling of hie veesel perpetually in his mind, and will find euch an invention as Mr. Froude's of incalculable value.

The observatione on board the City of Baltimore by the Committee of the English Admiralty proved that when the steamer was swung 10° to etarboard the magnetic needle wandered from its true point 25° and 30′ to the westward, and when shc was heeled 10° to the port eide, the needle erred 15° and 3′ to the east. making a total variation of 41° of longitude due to heeling alone, withont in any way changing the direction of the ship'e head.

The invention will aleo serve the additional and etill more important end of premonishing vessele of the approach of typhoons and cyclones in the more stormy regions of the ocean. The approach of heavy gales ie ueually announced by a ewell and confueion of the sea—the storm waves advancing more rapidly than the storm itself.

Colonel Reid etated that when the celebrated hurricane of 1839 occurred he was in Bermuda, and distinctly heard the sea breaking loudly against the eouth shoree of the island fully three days before the tempest broke upon it. At that time the hnrricane wae etill within the tropic, and distant 10° of latitude, and as the gale neared Bermuda the eurge increased. The increase or entire change of tides and currents or tidss earlier or later, the long and true swells, confused aud cross seas, raised in a pyramidal and other distinctive forms, are among the premonitione of a cyclone at sea; and theee premonitions, by the automatic or self-registering apparatus of the English invention, are not left to the zeal and sagacity of a worn-down or unekillful master, but force themeelvee upou the eye as they graphically display themselves on the paper prepared for recording them.

The valuable contribution to nautical inetrumente will be greatly valued at a time when navigation is so rapidly increaeing, and carelese or ignorant seamen eo often imperil the livcs and property entrusted to them.

CANNON POWDER.—For some time past some interesting experiments have been in progress at Fortrese Monroe, Virginia, for the purpose of improving and increaeing the exploeive qualitiee of cannon powder. With the aid of recent diecoveries, a powder ie said to have been manufactured which possesses 50 per cent. increaeed force, and, consequently, givea greater momentum to the ball, while the pressure on the aides of the gun ia diminished. In one of the late trials of this power, a 15-in. smooth bore was fired with the aame charge aa that used in the 12-in. rifled gun, fired at a target representing the side of the British ironclad Glatton.

CEMENT MIXTURES FOR STEEL.—Mr. Edward E. Houghton, of Philadelphia, proposea to use a combination of bonecarbon and hydrocarbon oile, as a cement mixture for the manufacture of ateel. The object of the invention is to convert iron into ateel economically, and to utilize the waste bone accumulated in the procesa of manufacture of the article known aa kosomoline. The bonecarbon is impregnated with hydrocarbon oil. The wrought iron is caae-hardened by immeraion in the bonecarbon, heated to redness. The aurface of the iron is of extreme hardness, and the metal ie not blistered —a deairable feature in finished work.

Ethnology in Hair.

The form and substance of human hair is different in differsnt races, and may be described, in its structure, as cylindrical, oval and eccentrically elliptical. The hair of the North American Indian ia cylindrical; that of the white race is oval, and that of ths negro (which is really not hair but wool), is eccentrically elliptical. When ths hair is cylindrical, the stretching aud shrinking powers are equal on all sides of the filament, and this condition gives it the lank, straight appearance of that of ths pure blood Indian. The oval hair displays a greater number of fibres upon the flattened side than elsewhere,—and this condition givee the hair a teudency to curl or curve in that direction. When eccentrically elliptical, it not only always curls but oftcn assumes a spiral shape, as on the head of the uegro. The hair of the Chinese ie nearly cylndrical, and hence it is that curled hair is almost uuknown among that people. I have passed the hair of the Nortb American Indian, and also that of a Chinese, between rollere, so ae to flatten the pile, and each instantly curled. We may, therefore, easily determine the shape of the filamente of hair from its appearance. The cylindrical hair (and coneequently lank) of the North American Indian is a type of all natives of the continent of America; that is to say, purely aboriginals. Some hair taken from the Templo of the Sun, near Lima, in Peru, in South America, belonged to one of the ancient inhabitants of that country, who were possibly, and probably, I think, of the eame race ae the mould-builders of North America, wae cylindrical, and coneequently straight. When the mound-buildere flonrished as the poeessore of our land west of the Alleghany Mountaine, we know not. The ancient Peruviane, their brethren, had cylindrical hair, and thereby is proven their affinity to the North American Indiane.—*Historical Record.*

THE THEORY is now advocated by eome very eminent astronomers that the peculiaritiee of configuration observed on the eurface of the moon are due to the sole action of volcanic forcee, whereae those which the earth preeents reeults from a combination of volcanic and atmospberical agenciee. Thue, the most characteristic feature of all lnnar volcanos is the ring or hoop-shaped cratcr, surrounded by circnlar or nearly concentric ridgee. On the earth's eurface, volcanoa deviate more or lese from thie type, and, if these deviations be owing to the differences between terreetrial and lunar euperficial forces, it ie argued that euch differences will be most distinctly manifested in those casee where euch terrestrial forcee possese the higheet degree of energy. A notable illustration adduced in support of this point is the peculiar structure of the volcauoe in the island of Java, where the action of tropical rains and hurricanes has been effective in producing the very widest differencee between the terrestrial volcanic summits and those observed on the moon'e surface. Instead of any hooped structure, the former present specimens of radiating ribs, like those of a folded lamp ehade, or an umbrella half closed—an appearance dne to the very regular manner in which tropical currents scope out the friable summits of cratere.

FUTURE ECLIPSES OF THE SUN.—Mr. Robert T. Paine communicaies to *Silliman's Journal* a list of eclipses vieible in the United States during the remainder of thie ceutury. The first central eclipee will be that of September 29, 1875, which will be annular in part of the State of New York and in four of the New England States. The duration of the ring on the central liue will be three minutee, thirty-nine eeconde. At Boston it will be only two minntes, twenty-nine seconds. The belt of country over which the annular eclipse will extend will he 110 miles wide. Within it are situated the observatories of Hamiltou College, Albany, Harvard University, Amherst College, and Dartmouth College. The first total eclipse will be that of July 29, 1878, when the shadow of the moon will pase over Britieh Columbia, Montana, Colorado, Texae, and Cuba. At Denver, Colorado, the eclipse will be total nearly three minutes.

INTERESTING TO IRON BUILDERS.—A recent diecovery, of especial interest to iron builders, ie mentioned in some of the foreign technical journals, which would appear to deserve attention in this country. The diecovery relates to the preeervation of iron beams used in hydraulic works, and coneiste in the application of a chemical proceas, operated at once, without any particular tools, and at a comparatively trifling cost. Suppoaing, for instance, it is deaired to join two iron beama together; holea are firat bored and afterwards filled with some zinc filling mixed with any fatty material, after which the peg or acrew is introduced in the ordinary manner. A galvanization, it ia said, is thua produced, in its characteristics and effects absolutely the same aa when iron is dipped into molten zinc, and—as will readily be aeen—at a greatly reduced expense. It ia also affirmed that the same proceaa can be applied to timber; a number of careful experimenta having bsen made to test its adaptability for this purpose, with the most satisfactory and succeasful reaulta.

EAR TRUMPETS of a wonderful constructiou by which eounda can be heard at a diatance of a mile, are to be on exhibition at the Vienna Expoaition.

NOTE.—†—California. *—Washoe. ‡White Pine. §—Ely District. ¶Eureka District. ‖—Idaho. !—Nearly.?—Over.

S. F. Stock and Exchange Board.

THURSDAY, November 14th, 1872.

The stock market has been irregular this week and generally rather depressed. The salee last week amounted to 2,418.700—a fair amount taking into consideration the holiday on the 5th. The unusual numher of assesements recently, with the few dividends, hae a depressing influence on the mining share market, but we are promised a change by a number of companies. Thus far thie month, the Raymond & Ely mine, after some difficulty, paid its dividend of $7, amounting to $210,000. The details of the litigation about thie mine will be fonnd in another column. The Black Diamond Coal Co. paid a dividend of one-half of one per cent., and the Eastport Coos Bey Co. a dividend of $5 per ehare. The Providence G. S. M. Co. have declared a dividend of $1, payable tbe 12th inst. Thie is the first dividend of this Co. The Cederburg also paid a dividend of $12,000. The influence of the Boston fire on the stock market was not great, althongh a depreseing influence was felt. The featnre of the week has been the Raymond & Ely euit.

On Friday, the businese in stocks wae good, hut prices were weak. Business at the afternoon Board wae, however, light, and prices lower at close. Belcher fell $1; Crown Point, $2; Chollar, $5; Con. Virginia, $6; Gould & Curry, $16; Hale & Norcroee, $3; Ophir, $1; Seg. Belcher, $2: Yellow Jacket, $8. Eureka Con. fell $2; Meadow Valley, 2; Raymond & Ely, $3; Pioche, $1.

On Saturday, the market was dull at lower prices. Belcher declined $4; Con. Virginia, $9; Caledonia, $1; Hale & Norcross, $3; Overman, $3; Savage, 4; Seg. Belcher, $6; Jacket, $3. Gould & Curry roee $3; Crown Point, $1.

On Friday, the market was firm, hut the "bear" influence brought prices still lower than on the previous day. Belcher declined $2; Crown Point, $2; Con. Virginia, $14; making a fall of $34 since Thursday; Chollar, $1; Caledonia, $2; Empire Mill, $1; Gould & Curry, $2; Hale & Norcross, $4; Opbir, $4; Savage, 5; Jacket, $8; Overman, $1; Raymond & Ely fell to $118 under the effect of the restraining order mentioned in another column. It recovered to $124. Meadow Valley fell $1; Pioche, $1.

Monday, stocks were a little steadier, and in some cases prices recovered. Yellow Jacket fell $10 in the morning, but recovered it in the afternoon Board. Con. Virginia rose $13 over previoue day's sale. Raymond & Ely, $3; Meadow Valley, $1. Belcher fell $3; Crown Point, $5; Gould & Curry, $15; Hale & Norcross, $1; Savage, $6.

Wednesday, the mining share market wae better, and pricee higher, although tbere was not much husinee done. Belcher roee $3; Confidence, $2; Overman $4; Savage, $4; Yellow Jacket, $10; Raymond & Ely, $5; Con. Virginia fell $9, and Eureka Con., 2.

To-day, there wes a fair husiness, hut at irregular prices. The difference in prices this week aud last will be eeen hy a glance at our "Stock Tahlee."

Below will he found news from tbe prominent minee later that in the our "Mining Summary:"

CHOLLAR.—During week ending Nov. 9tb, 60 toue of ore were extracted; 1,019 tons sent to mill and 469 tons remain on the dumpe.

SAVAGE.—During week ending Novemher 9th, 289 tone of ore were extracted assaying $34.62 per ton; 595 toue were delivered at the mills and 14 tone remained on dump.

RAYMOND & ELY.—On the 11th inst., the Superintendent shipped $30,274; previoue shipments this month amounted to $65,338, which makes a total of $95,612, equal to $10,623.55 per day. The dividend of this compauy was paid on the 13th. The mills have recently been repaired aud cleaned.

HUHN & HUNT.—From this mine $1,853 was shipped on the 9th inst.

PHOENIX.—Ten tons of bullion were shipped on the 8th, valued at $4,000; on the 10th 10 tons of hullion were shipped, valued at $3,950. Mine developing favorahly.

SILVER PEAK.—A rich strike is reported in thie miue; two hars of bullion were ehipped on the 11th, and two more on the 13th.

EUREKA.—Letter of the 9th says the clean up for tbe week's run of 15 etamps is 1,500 ouncee of amalgam.

CEDARBURG.—From this mine $6,350 in bullion bas heen received.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the minee mentioned

California.

ALPINE COUNTY.

GLOBE.—Monitor *Miner*, Nov. 2: The workmen yesterday hroke into quartz and are now 4 ft. into the lode.

THE main tunnel of the Monitor is 561 ft. long.

CALAVERAS COUNTY.

NEW MILL.—Calaveras *Chronicle*, Nov. 9: A 5-stamp mill is being erected on the Wolverine Railroad, and will he in readinese to commence cruehing in about a month.

MACHINERY.—C. J. Garland, who recently purchased the old Vance mill, Mosquito Gulch, is having the machinery overhauled and thoroughly repaired.

RICH ROCK.—Tbe Horse-thief and Jesus Maria, contiuues to pan out ae well ae ever. A recent clean-up, after crushing 10 tons of rock, yielded $380.

ITEMS—RAILROAN FLAT DIST.—The main shaft of the Wolverine is going down one ft. per day. The ore in the bottom ehowe pleuty of free gold. The lower north level of the Petticoat is in 60 ft. The level will have to he extended prohably 800 ft. to reach the knowu chimneys of pay ore.

WEST POINT DIST.—The Bartola has been freed of water and ie awaiting the arrival of prospective purchasers.

MOSQUITO DIST.—Grasehopper extending the lower nortb level for prospecting purposes. Some 30 tons of fair ore on dump. Dowling & Co. crushed 60 tone of qnartz yielding $24 per ton. The new building for the nse of the Good Hope mine and mill are nearly completed. Litle progress ie made in the lower tunnel of the San Bruno. The new shaft of S. Smith & Co.'s mine is down 50 ft., vein 3 ft. wide. The Cuha, first east exteneion of the S. Smith & Co. mine, is being opened. A Co. of Chilenos are takiug out very handsome ore near the San Bruno.

NEVADA COUNTY.

EMPIRE.—G. V. *Union*, Nov. 5: A har of gold was brought in yesterday valued at $8,000. Total produce for the month $14,000—with expenses $9,000.

ITEMS.—The Empire, Ophir Hill, is doing magnificently. A few days ago a new, large and rich ledge was struck in the 8th level. It is fully 3 ft. thick and shows well in heavy sulphurets and in free gold.

The Idaho has started its 35 stamps with plenty of rich ore on hand.

PLACER COUNTY.

AUBURN MINE.—Placer *Herald*, Nov, 9: Fine, rich milling ore has heen struck in the eaet drift. The western drift has heen run from the 175-ft. level, through fabulously rich rock, some 80 ft. wheu another force was put to work running an east drift from tbe same level, and at about 40 ft. they struck a rich hody of milling ore.

PLUMAS COUNTY.

STRUCK IT.—Quincy *National*, Nov. 2: The workmen in the Baker ledge, Cherokee, have recently been sinking a sbaft to open out another level in the mine, and the lode has attained a width of 4 ft., the rock paying at the rate of $16 per ton. The 12-stamp mill is running steadily, and making good returus.

THE NEW DITCH CO.—Kelly, Garland & Co., have recently commeuced operatione on their new ditch, leading the waters of Indian Creek, from a short distance below the old Blood sawmill, to their claime eome 4 milee below, or near Soda Point. The ditch will be 6 ft. wide on top, 3 ft. deep, aud with the grade given, ie to ruu 3,000 inches of water.

EUREKA.—Several hundred men are hard at work on the Eureka mountain, and timee are very lively in that section.

BIG CHUNE.—Jo. Rock and partner, whose claime are on Yellow Creek, discovered a few daye ago

Nevada.

ELY DISTRICT.

Review—Bullion.—Ely *Record*, Nov. 2: The shipment for Oct. amounted to $454,557.07. The shipment for the week amounted to $87,458.29.

Silver Peak.—An incline has been sunk on this ledge 120 ft., showing a well developed vein averaging 5 ft. in width. At the 90-ft. level 2 drifts have been run, the north drift being in 30 ft., and the south 75 ft. At this depth stoping has been commenced. The body of ore is from 6 to 6¼ ft. in width. In the 120-ft. level the ledge shows as large and is of the same grade of ore as the above.

Excelsior.—The ledge in many places is 4 ft. wide. In the winze, which is 80 ft. below the 200-ft. level, some extremely fine ore has been discovered. The new working shaft is down 100 ft. The 5 stamp mill at Bullionville is working steadily on this ore and is making excellent returns. Last week, bullion to the amount of $5,000 was shipped, and another shipment will be made on the 5th inst. The bullion is 935 fine.

Phœnix Phenix.—On Thursday work was resumed on the shaft, which is down 130 ft. with some improvement in the rock. A portion of the hoisting machinery has arrived.

Sunbeam. — The new hoisting machinery works satisfactorily and commenced raising ore last Saturday. There are 100 tons on the dump of first-class ore.

Caroline.—Capt. Hardy has let a contract to sink a shaft 100 ft.

Meadow Valley.—The yield for Oct. will be fully $115,000. It is expected the product of the present month will fully reach $150,000. The production of ore for the past month was nearly 1,200 tons. A full complement of men is steadily employed in No.s 3 and 7, and the product of ore for this month will not fall short of 1,800 tons. In shaft No. 3 the workings are being most vigorously prosecuted, and the results past and prospective are most encouraging. In No. 7 work has been resumed in the western drift on the 4th level, and in a few days sinking will be commenced on the same incline which is 740 ft. in depth.

Raymond & Ely.—The shipments for Oct. reach $342,000.

Mazeppa.—The shaft is 90 ft. in depth and has cut several streaks of fine ore. The ledge is somewhat broken and not very well defined.

Ivanhoe.—The working shaft is down 220 ft. The ledge at the bottom is 2 ft. wide showing a high grade of soft decomposed ore. The old shaft is 320 ft. deep, and the ledge in that portion is 3 ft. in width.

Marion.—The drift on the line of the lodge is 100 ft. in length. The ledge has improved from the start. In the face of the drift it looks very well.

Chief East Ex.—Three shifts are employed. The winze being sunk in the 90-ft. level is 40 ft. in depth.

Page and Panaca.—In the 360-ft. level, which is in 183 ft., the indications are good for speedily cutting a vein of ore. The shaft has reached 463 ft. The ledge near the bottom is from 2 to 3 ft. in width.

Alps.—The shaft is 194 ft. deep. At this point a station has been opened and a drift will be commenced on Monday. It is expected to reach the ledge in about 30 days.

Pioche.—During the past week, sinking has been commenced upon the ledge below the fifth level.

Huhn and Hunt.—Seven bars belonging to this Co., valued at $8,969.63 are ready for shipment.

Amador Tunnel.—The face is 320 ft. from the mouth. A station has been formed in the winze about 35 ft. from the level of the tunnel, and a drift opened along the line of the ledge. It is in some little distance, and a very fine body of ore was struck last Friday.

Bowery.—The shaft is down 230 ft. and still sinking. The new machinery works to a charm.

Jolly Traveller.—Sinking the shaft. It is thought that the ledge is close at hand.

HUMBOLDT COUNTY.

Bullion. — Unionville *Silver State*, Nov 2: Amount shipped from the Arizona since our last issue, was $6,833.

Dun Glen.—Work progresses on the Leng Syne, Empire, Tallulah, Gem and others. On the Empire 6 men are engaged. The Leng Syne producee sufficient ore to supply Sprague & Co.'s mill steadily. A new 5 stamp battery has been placed in Sprague & Co.'s mill, to which 5 more stamps will be added soon.

REESE RIVER.

Bullion.—Reese River *Reveille*, Nov. 2: W. F. & Co. shipped from this city during Oct. 70 bars weighing $6,912 lbs. valued at $101,939.99.

BELMONT.

Monitor Co.—Have their lower tunnel within a few feet of the main ledge. The rich body of ore struck last week in lower south level has been stripped for some distance, and proves as good as it was when it was first opened.

El Dorado Co.—Has its 400-ft. level run 33 ft. southerly. Several large patches of very rich Stetefeldt ore have been cut through. The stopes in north 340-ft. level show a 6-ft. breast of splendid milling ore. The foundations of the El Dorado mill are all laid, and the framing nearly ready to raise. This mill will be of 20 stamps, 6 pans and settlers in proportion, and a first-class Stetefeldt furnace, with all the latest improvements. Working on the Co.'s 2 mines 50 men, and on the mill 20 men.

Belmont Co.—Are building a new house over their hoisting works on the Canfield. The levels are being run by contract, and are progressing finely. Working 30 men.

Combination Co.—Taking out some fine ore from the Transylvania. Working 20 men.

El Dorado North Co.—Have had their mine surveyed with a view of sinking a vertical shaft to cut the vein at a greater depth than any of the present workings.

WASHOE.

Summary.—Gold Hill *News*, Nov. 7:

Belcher.—Daily yield 300 tons, all of which is hoisted through the company's own shaft, having no further use for the Yellow Jacket shaft except in getting timbers, men, etc., through into the ore stopes of the 1,000 ft. level. The main incline is down 115 ft. below the 1100-ft. level. The main south drift at the 1200-ft. level is in 176 ft. from the Crown Point line, with the face in fine ore. A cross-cut east is commenced at this point. The old cross-cut or drift east from the winze is being reopened to extend farther east. The ore breasts of the 1100-ft. level yield and hold out admirably. At the 1000-ft. level the drift south from the ore stopes is in 252 ft. from the Crown Point line, toward the shaft, and from the shaft the drift north to connect is 229 ft.

Hale & Norcross.—All the improvements in the hoisting machinery have been completed.

Silver Hill.—The prospecting drifts on the first level are vigorously pushed forward.

Utah.—No work has been done in the new shaft for the past week. The reopening of the closed chambers in the old mine is continued through the old upper adit. A fine looking vein has been opened, but the ore is not of sufficiently high grade to be redneed with profit.

Virginia.—Work has been resumed on the hoisting works. The shaft is down 30 ft. below the 500-ft. level in good working ground. The cross-cuts and drifts south on the 500-ft. level show no change. The main west drift on the 1167-ft. level from the Gould and Curry is driven ahead.

Yellow Jacket.—Daily yield 20 tons from the old workings, above the 1000-ft. level. The new pumping arrangement works splendidly.

Occidental.—The northern adit is pressed vigorously forward.

Julia.—Sinking the shaft is making excellent progress. The main east drift is in 800 ft.

Caledonia.—The south drift on the 300-ft. level of the old works is again in ledge matter.

Imperial Empire.—Sinking the incline and prospecting the various levels goes steadily on.

Insurance.—The incline is down 52 ft., the entire size of the shaft in good ore.

Senator.—The shaft is down 265 ft. in good sinking ground. The new hoisting works are finished.

Sierra Nevada.—Prospecting the 500-ft. level is still vigorously prosecuted.

Crown Point.—Daily yield constantly increasing. The ore breasts and stopes of the 1,100 and 1,200-ft. levels continue yielding splendidly. The various cross-cuts at the 1,300-ft. level are in fine ore. The body at that point will doubtless prove fully as good and extensive as in the levels above. There is no present indication of the bottom of this immense ore body being yet found. Neither is its extent south or north fully ascertained.

Baltimore Cons.—The shaft is down a little over 300 ft. At the 250-ft. station a drift for the ledge was commenced week before last which is in 45 ft.

Buckeye.—The fine body of ore developed recently between the second and third levels is looking splendidly. It is 10 ft. wide. The stopes between the first and second levels are yielding excellently, and the mill is kept steadily running.

Justice.—The drift east at the 400-ft. level is in promising quartz, and the drift south is in porphyry and clay.

Daney.—The drift at the 700-ft. level is in 42 ft. from the shaft. Cross-cutting is being commenced to more fully test the ledge at that point.

Knickerbocker.— The main west drift is in 300 ft., running through porphyry with occasional seams of clay and quartz.

Crown Point Ravine.—The work of cleaning out and re-timbering the shaft, is making good headway.

Union Cons.—The main west drift is in 330 ft. in good working ground.

WHITE PINE.

Bullion.—White Pine *News*, Nov. 2: The shipment during the past week, was $5,939.09.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—The Eberhardt, Blue Belle and Attwood shafts have connected at the lower level, and sinking for better ventilation. Prosecuting the drift from the bottom of the North Riedele chamber to the north. Central shaft down 144 ft. Running a drift from the Lady's chamber south to connect with the Central shaft. In the Beecher, ore of a fair grade is being taken out of the disputed ground.

Beecher Cons.—The ore in the old Blesdel works holds out. In the Beecher works it is supposed a body of ore will be struck.

O. H. Treasure.—The various workings are looking well. The Wheeler tunnel is being pushed ahead in spar and vein matter, which is dipping downward. The ore in the shaft below the tunnel continues in quality and quantity.

Sunbeam.—Sinking in the Moscow shaft, and running a little to the South in quartz and black spar. The mine shows improvement since last review.

Mammoth.—The bottom of the shaft is looking well, and down about 55 ft. in good ore. Shipping ore to the Big Smoky mill.

Silver Plate.—Running in the tunnel which is over 50 ft. deep, in good ore.

Noonday.—Resumed work on the cross-cut in the lower tunnel, and shipping good ore to mill.

East Sheboygan.—Prospecting and forming connection between the air shaft and South drift, and prospecting into the hill.

Copper Glance.—Working in the northwest drift, from which good ore has been extracted during the past week.

Outside Ists.—Robinson.—The Canton Co.'s furnace will start up in about 5 days. A large body of high grade ore has been struck in the Old Bachelor. The Emma shows a large body of high grade ore. The Cecelia shows a ledge of high grade ore, rich in gold, assaying from $100 to $200 per ton, without being assorted. The Rathburn is down 45 ft. in good ore, showing assays from $100 to $500 per ton.

A contract has been let to run a ditch from the shaft of the Old Bachelor. At 27 ft. after running on the drift 4 ft. from the shaft, a ledge of A No. 1 rock has been found. They have gone in 10 ft. on the ledge, and have not yet got through the body of ore, which assays $750 per ton.

Western Slope White Pine Mt.—Trench.—The west drift has struck a body of rich ore, which appears to be of considerable extent.

Schell Creek.—Schell Creek *Prospect*, Nov. 2: McMahon.—The shaft is down 100 ft. below the croppings and shows the foot wall at this depth to be nearly vertical; a fine body of ore in the face. They will soon commence a cross cut and run for the hanging wall; levels will then be run from the shaft in both directions along the ledge for the purpose of stoping out; the tunnel is in 170 ft.

Jupiter.—Shaft and tunnel look better than ever. The shaft shows good average ore at the bottom.

Kavanagh Tunnel.—Is in 108 ft.

Tehama.—Are working 20 men. Work on the upper and lower tunnel is being pushed with vigor; taking out considerable ore from the Allen No. 2, War Eagle, and other locations on the hill. The mill will be completed about the 20th inst.

Schell Creek.—Tunnel in 238 ft. Working 2 shifts.

Queen Springs.—Labaoss Tunnel.—In 210 ft. Working 2 shifts.

Caffrey.—Sold last week to a S. F. Co.

Ruby Hill.—Silver Wreath and Lookout Co.'s commenced work on the 29th; force of 3 men; running tunnel to Silver Wreath.

Wide West.—Running tunnel to strike the ledge; expect to strike it next week; in 60 ft.

Monitor.—Will commence work next week.

Cow and Calf, No. 2.—Working day and night; large body of good ore in sight.

Tambien.—Shaft down 47 ft; south drift in 40 ft.; at this depth rich ore has been taken out.

The 5-stemp mill at Ruhyville is running on ore from the Birch.

Arizona.

Mines and Mining.—Prescott *Miner*, Oct. 26; Mohave Co.—The shaft on the Fairfield is down 115 ft.; the vein is 8 or 9 ft. thick; rich rock.

The Empire Co. has two shafts on the Empire, each over 100 ft. deep; ledge some 12 ft. thick.

The Cupel, Little Tiger and other lodes are producing very valuable ore.

Maricopa Co.—Rich rock is every day being found in the mounteins near Phœnix and other points.

Pima Co.—The people are in great glee over recent rich finds of gold and silver.

Colorado.

Mt. Lincoln.—Denver *Tribune*, Nov. 2: The owners of the "Moose" have engaged 12 men to work day and night throughout the entire winter.

Over 1,000 tons of ore that have been taken out of the different mines, are stored at different points ready for smelting.

The "Moose" has 275 tons averaging over $400 per ton—the "Lincoln" 75 tons, averaging $300, per ton, the "Aztec," Mt. Bross, 30 tons, averaging $150 per ton.

Idaho.

Local Record.—Silver City *Avalanche*, Nov. 2: Red Jacket.—Work on the edit tunnel is steadily progressing, showing a vein 12 inches wide of very fine ore. It is the intention to drive this tunnel till it connects with the north shaft, where a large body of stoping ground will be opened. This ground will yield from 6,000 to 8,000 tons of ore. The South shaft shows a vein averaging 15 inches wide. The north shaft is down over 90 ft. on a vein equally good. A milliug of 80 tons, taken as an average from all parts of the mine, yielded $40 per ton.

South Mt.—The blower and other machinery for the S. M. S. Co.'s furnace arrived at Bullion last Thursday, and will immediately be put in position.

War Eagle.—Is being thoroughly prospected. The vein in the 5th level north, both in the stopes and drifts is of good size and quality. South in the same level it is smaller, but the prospects are good. The 3d level stopes show finely throughout, and it is estimated that there are at least 1600 tons of good milling ore there.

Empire.—The shaft is well timbered on the 3d level, and the drifts at that point started north and south. A contract has been let to sink the shaft 100 ft. for the 4th level. The Cosmos mill is crushing Empire ore at present with good results.

Mahogany.—The 5th level drift south is in 120 ft., showing a 15-inch vein of good ore. The 6th level drift south is in 115 ft., showing upon the face a fine vein of ore, rich in silver and permeated with free gold. Ten tons of ore are being daily hoisted. They have 350 tons in the ore-house, and will commence hauling to the mill to-day.

Minnesota.—They have a splendid ledge in the 4th level south. Within two weeks the 4th level drift and the south winze from the 3d level will be connected.

Pauper.—They are busily engaged in putting up buildings.

Golden Chariot.—The 9th level drift south is in 50 ft. showing a 2-ft. vein of fine looking ore. The Ellmore mill will commence crushing Golden Chariot ore to-day.

Ina Ellmore.—The shaft is going down rapidly. Splendid ore is being taken from the 8th level stopes and 9th level winze.

Montana.

The Jefferson Smelter.—Helena *Herald*, Oct. 31: The smelting works at Jefferson are engaged in cupelling 15 tons of rich silver bullion.

Ten Mile Silver Dist.—A lead, with a 15 ft. crevice, and rich ore, has recently been struck.

Legal Tender.—Work is being vigorously pushed. They are working 3 8-hour shifts in sinking. They have 26 inches of ore in the bottom of the shaft, 14 inches is of first class, assaying $700, the balance—second class—averaging about $200 per ton.

Utah.

Big Cottonwood.—S. L. *Tribune*, Nov. 7: The Konigsberg consists of argentiferous galena, yellow and bluish-green chlorides. The discovery shaft and tunnel have been worked 30 ft. and exhibit a width between well-defined walls of 5 to 8 ft.

The Venus vein exhibits well-defined quartzite wall rock 4 ft. apart, at present only showing a few inches of solid galena, carbonates and chlorides. On this vein a shaft has been sunk a few feet and a tunnel, 300 ft. apart, both exhibiting evideuces of a good mine.

The Thoa exhibits a vein between well-defined wall rocks of 16 inches in width, carrying 12 inches of mineral consisting of galena, yellow carbonates and chloridee. Ore from this vein assayed $200 silver per ton.

The Surprise vein has been opened by a tunnel 21 ft. and shows a vein of 2 ft. in width of decomposed quartz carrying $40 in silver and $10 in gold per ton, with a smell per cent. of lead.

New Incorporations.

Tintic M. and M. Co.—Nov. 11. Location: East Tintic Mining District, Utah Territory. Capital stock, $3,000 000, in 30,000 shares. Trustees—John F. Miller, William H. Patterson, O. H. La Grange, N. Hamilton and O. C. Miller.

James Point Gravel M. Co.—Nov. 13. Location: James Point Mining District, Placer County. Capital, $240,000. Trustees—W. F. Leon, J. F. Gruman, and R. H. Rogers.

Cummings G. M. Co.—Nov. 13. Location: Mount Slusi District, Kern county. Capital, $2,000,000. Trustees—W. F. Leon, R. H. Rogers and S. Riddel.

Meetings and Elections.

At a meeting of the Trustees of the Washington Quicksilver Mining Company, held on the 13th, Dr. George E. Hinckley was elected President, and H. B. Congdon Secretary. Captain James White, late of the New Almaden, was elected Superintendent. The mines of this company are located in Trinity county.

Confidence S. M. Co.—Trustees: R. F. Morrow (President) A. K. P. Harmon, J. H. Dobinson, Geo. W. Beaver and W. W. Stetson. R. Wegener Secretary.

San Jose Cons. M. Co.—Trustees: Alexander Osselli, M. Waterman, E. L. Gould, Chas. E. Hoffman and J. H. Applegate.

Mining in Butte.—The Garden ranch, consisting of 420 acres, recently changed owners, the purchesere paying $5,800. A number of Chinemen worked there some twelve or fourteen years since, but were driven off by the proprietore of the ranch. They have since been mining in Tuolumne county, but remembering the gold fields of Butte, have returned and invested where they feel confident of reeping a rich reward, and fear no danger of being again disturbed. They paid last week $2,500 to the new owner of the ranch for two and one-half acres from the upper end of the ranch, to Chinamen as mining ground, for the sum of $2,500, the ground to be leveled off and left in good shape for seeding, and revert to the ranch when mined out.

Coal in West Virginia.—There are 16,000 square miles of coal land in West Virginia. Its fields are perhaps as rich as those of Pennsylvania. Hitherto almost inaccessible, they are rapidly being opened by railroad and river transportation. The coal deposits are about 100 miles seperated from the iron ores, which are rich, varied and in close proximity to exhaustless stores of lime. The development of these mines and the growth of an active iron manufacture in that State is a mere question of time. If the coal famine in England, and the excitement it has produced both there and here, should cause these rich treasures of our material wealth to be developed from the mines and made available a few years earlier than would have otherwise occurred, both this country and England will be gainers by the achievement.

English Capital to the amount of $3,500,000 is said to be invested in mining operations in this country. We had an idea that the amount was much larger.

Lecture Upon Scale Insects.

Delivered Before the Oakland Farming, Horticultural and Industrial Club, Oct. 25th, 1872, by Dr. Wm. P. Gibbons of Alameda.

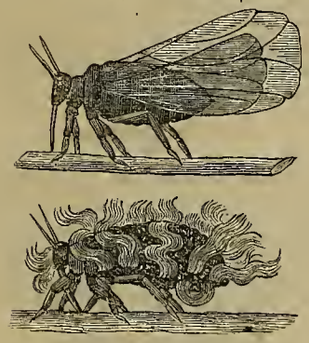
While pursuing occasional investigations into the habits of predaceous insects, I find the subject so expansive as to require more time and labor than I can now appropriate to it. My observations will therefore be directed to 3 or 4 species only, which are prominent on account of the great mischief which they commit in our orchards and gardens. We will commence with the

Aphides.

The aphides, or plant lice are so universally diffused, that everybody knows them. In the United States there are about 40 species enumerated. They belong to the sub-order *Hemiptera*, which includes all insects whose mouth is furnished with stylets, with which they pierce the vessels of plants and animals, and suck in their food. Thus, besides plant-lice, the order includes bed-bugs and body-lice, locusts, coccidæ or scale insects, chinch bug, and many others.

Our interest lies in the species commonly known as the Wooly Aphides; it differs from some others in being without a pair of honey tubes, which some have projecting from the 6th segment of the body. Bonnet discovered that aphides were parthenogenetic; *i. e.* able to produce offspring without the presence of the male. To some extent, the observation of Dr. Burnett will apply to our California species. He states "that in early autumn the colonies of plant lice are composed of both male and female individuals; these pair, the males then die, and the females begin to deposit their eggs, after which they die also. Early in the spring, as soon as the sap begins to flow, these eggs are hatched," and the young lice soon come to maturity. "In this state it is found that the whole brood, without a single exception, consists

Figs. I and II.



solely of females, or more properly of individuals who are capable of reproducing their kind. This reproduction takes place by a viviparous generation." The second generation pursues the same course as the first, the individuals of which it is composed having no trace of the male among them. The same conditions are again repeated, and according to Bonnett, he carried them through 9 generations under these conditions. Duval obtained 11 generations in seven months, and Kyber states that a colony of *aphis dianthi* continued to propagate for four years, without the intervention of males. Dr. Burnett considers this anomolous mode of increase as a process of budding, and that the whole series, like the leaves of a tree, constitutes but a single generation, which results from the union of the sexes during the preceeding fall.

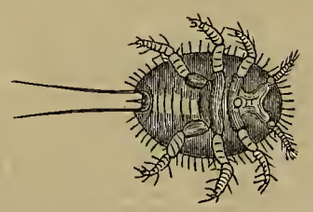
Our California winters are scarcely ever so severe as to destroy those animals which enter into a state of hybernation, and though I have watched closely during the present season, I have never been able to detect a solitary male upon an apple tree. Numerous broods of young, however, were apparent from time to time, and as the community was piled up by those coming to maturity, some friendly wind would transport a woolly group to another tree, which, happily might be on my neighbor's premises.

Hence, I entertain no doubt of our species maintaining its perpetuity without the presence of males. The only group of the two sexes which I have succeeded in finding, was on a pear tree. There were not more than fifty in the community, about one-half of which were males. The figures here referred to give a correct diagram of each sex. These aphides are now on the look out for winter quarters. A loose scale of bark—an old adherent bud envelope—a scratch or cut into the bark— the projecting edges of new wood over the surface from which a branch has been pruned, all constitute localities where they can snugly winter. To be sure, some are more fastidious and make their way down below the surface of the ground, and settle among the roots of the tree, where they continue to propagate with marvellous rapidity; so that when the careful husbandman starts in on his vernal tour through the orchard, and removes the soil from around each tree, he not unfrequently finds ten times more heads of of live stock within a few inches square, than he has of *civilized herbivora* on the entire ranch.

The Aphis, as is well known, commences its career either on the trunk of a tree, or on a small branch. It appreciates all the careless habits of a gardener, by selecting such spots for colonies, as have had bark bruised or torn; or such rough places which may have been left by clumsy pruning. From these points it gradually sends forth its pioneers to the next leaf axil, and continuing this process, it soon takes entire possession of the tree, if left alone. During the fall, in our climate, if it does not secrete itself in the manner heretofore stated, the female deposits her eggs in such places as have been already indicated, from which points they begin to hatch out in February.

The other genus belonging to this sub-order, which we will here notice, is the *Aspidiotus* or scale insect. In the Eastern States the most generally diffused and destructive species is the *A conchiformis*, so named from its scale cover representing in shape an oyster shell. As I am not certain of the identity of this species with that of California, I will pass over any effort at description till a more convenient season; sim-

Fig. IV.



Young female *Aspidiotus* from a pear tree.

ply premising that our list of the number of species, sustains the established reputation of the Pacific Coast, there being not less than five.

There is no necessity for me to repeat the account which I gave some weeks ago, of the habits of this insect. It is probably the most destructive and aggressive of any which infest our orchards. Should a single female once gain foothold on a tree, her progeny never leave it till growth and vitality are destroyed.

Our present object is to deal with the question in its practical aspects. And while giving full importance to the injury inflicted on orchards by predacious insects, we must not overlook other causes which impair the vigorous growth of trees. Most prominent among these, is insufficient or careless cultivation. Neglect this, and you neglect the fundamental conditions which produce healthy trees and perfect fruit. With vegetation as with animals, imperfect or arrested nutrition lays the foundation of disease, and gives easy development to parasitic or fungoid growth; the presence of which, reacting on the vegetable tissues, soon destroys them. How many of your orchard trees are now literally covered with a common lichen, the *Cetraria Californica!* Now, pull off a plant of this, which has been rooted on the bark for two years, and what will you see? 1st, a large pupa of an hemipterous insect; 2d, the *aspidiotus*, or scale insect; 3d, the larvæ of a neuroptera; 4th, an acarida, or mite insect; 5th, one or more spiders. And were it not for making the record appear unreasonably large, I would add a small worm which I have not diagnosed. Take the lichen, gentlemen, examine for yourselves the happy family which it contains; number these various animals on the trunk of a small pear tree one inch and a half in diameter, and five feet long, and when you reach the record of 30,000, say whether you have completed the census. Without doing this, you would hardly believe that you have scarcely an apple or pear tree in your garden which does not sustain a living population of 100,000 insects. Nay, don't be alarmed; this is a very

Fig. III.

small number even for a careful gardener. Let me treat you to a twig of almond or peach tree. Do you see that beautiful red tint which is spread round the angle of the branchlets? It looks as though some rural artist had been practising on lights and shadows. Now bring your eye glass to bear upon it, and you will see an aggregated mass of beautiful little eggs, round as a sphere, and sparkling as rubies. Count an inch of them in linear dimensions—you can't make less than 200 eggs, which will yield 40,000 to the square inch. Next number the branches and the twigs of that small tree twelve feet in hight, and by the time you finish your estimates with the greatest care, you will have over 5,000,000 of those little eggs figured out on your account book. Do you think you have them all? Then take a few leaves of the tree, and bring your eye glass in requisition once more. Of course you perceive those little animalcules which are busily striding along on four legs, apparently not knowing what to be at, yet very anxious to make themselves useful in some manner. Count again, but don't overtax your arithmetical genius. One, two, three, four and five hundred you find on a single leaf, saying nothing of an extra one hundred eggs which mamma forgot to leave below on the branches. I might as well here tell you that there are 30,000 leaves on that tree; and if we make a fair average, and estimate two hundred animalculæ to a leaf, there will be a living population of 6,000,000 of these *arachnida* with the 5,000,000 of eggs in expectancy, to be supported on that small arborial territory.

Having now got all these animals together and they present quite a formidable array—the next question is to dispose of them in an advantageous manner. The last named insect belonging to the spider family, though probably producing some little injury to trees, on account of its great numbers, is of especial benefit to the garden; it feeds upon the aphis and the scale insect. I must confess however that my acquaintance with it is of so recent date, that I am not yet prepared to demonstrate its habits, without a liability of making some errors. I first discovered them about the 1st of June, in limited numbers; two months afterward they greatly multiplied and by September they had attained their greatest development. A stream of water from the hose exterminated most of the animals and repeated once a week it almost cleared a tree on which I found the greatest number. Though found on almonds, peach, cherry, plum, apple and pear trees, they are only in quantity on the first three and I have been unable to find a live aphis or aspidiotus on either cherry, peach or an almond tree. The cause of this exemption may not be owing to the presence of the acarina, but it is strongly suggestive. Next season I propose to cultivate the crop on apple and pear trees in order to determine the true relation which they hold to other insects.

It is still an unsolved problem how to deal with our apple and pear trees; I have been prying into the experience of writers and gardeners, without deriving any substantial results. After numerous experiments I am induced to believe the most effective treatment for the scale insect, is a solution of caustic potash. Four ounces of water to one of potash, will kill the animals and the tree also. Sixteen ounces of water to an ounce of potash may be applied without injury to tender bark or buds. The entire tree may be washed over with a whitewash or paint brush. One of my neighbors extolled the use of tobacco juice, as a certain poison. As he used tobacco largely in his own system, he could speak advisedly of its toxical properties; and I shall hereafter adopt the combination in full faith that should the reduced strength of the potassa liquor fail to kill the insect, the narcotic combination will surely settle the question.

This mixture is also the best which I have found to kill aphides. These animals have a film of resinous matter over their hide, which

Fig. V.

prevents a liquid, not alkaline, from coming in close contact with their absorbant surface. Whale oil soap water is much used for the same purpose, and probably with good results. Under no conditions, however, will the result be satisfactory, unless the applications are applied often enough to destroy the last animal or egg that may be living on the tree. The proper time to do this work is during early autumn, soon as the leaves fall, or before. Every trunk, branch, twig and bud should be carefully washed with the liquid. True, the process involves considerable outlay of time and some little money. But how much did your trees cost you in the first case; how much money and labor have you bestowed upon them already? How many years have you been waiting for them to bear fruit? And will you now let them die for lack of two hours culture over each tree and five cents' worth of potassa? Try the experiment on one tree, and if the foregoing plan will not clean off every particle of moss and kill every insect, and insure a good, healthy, productive tree, instead of that diseased runt which can hardly hold on to life on account of its one hundred thousand parasites, then bring your bill of expenses into the Farmers' Club, and I will pay it for you.

One more remark will conclude my paper. There are some nurserymen within a thousand miles of this locality, who sell from one to five hundred insects with every tree that leaves their premises. This is especially true in respects to plants and shrubbery raised under glass. Every horticulturist and amateur gardener should avoid such establishments as he would a pest house. No young tree nor shrub should ever be transplanted to your garden without being closely inspected and thoroughly cleansed of all insect life. Care and watchfulness will protect your fruit trees and gardens, as perfectly as it will keep vermin and itch from your children.

It will be observed that the cuts illustrating the above lecture are larger than life size.

Fly Paper.—Boil together equal parts, by weight, of glue and molasses, spread it over common brown paper, with a brush, while hot. Place a sheet of paper in every room in your house. It will capture every fly in the room within a day. The paper can be thrown in the fire and a new one used, when covered with captured flies. So says an exchange.

Wit does not take the place of knowledge.

Virginia and Truckee Railroad.

The cave which occurred in the American Flat tunnel on the Virginia and Truckee Railroad, had a very serious temporary effect on the mines of Virginia, and the Gold Hill *News* estimates the damage not less than $1,000,000. The road has regulated the price of wood, lumber, etc., and reduced prices to a reasonable figure, so its stoppage has caused considerable trouble.

The following extract from the report for 1872 of George W. Chedic, Assessor of Ormsby county, through which a good portion of the road runs, will be read with interest, as giving some idea of the importance and business of this road, as well as of the mining, milling and other interests and resources of the country in connection therewith. This report is published in the Carson *Register* of the 27th instant.

The Virginia and Truckee Railroad is now completed from Virginia City via. Carson City to Reno in Washoe county, connecting at that point with the Central Pacific Railroad, and is now proving of great advantage and convenience to the citizens of this portion of the State. This road is fifty-one (51) miles in length, over which 22 trains run daily, and transporting about 200 tons of merchandise per day, besides carrying about 600 tons of quartz from the mines in Storey county to the various mills located on Carson river, daily. There is annually transported over this road about 110 thousand cords of wood and about 20 million feet of lumber, taken principally from Ormsby and Douglas counties to Storey county.

The railroad company have now in use eleven (11) locomotives, and will add from 3 to 5 more first-class engines to this number by the 1st of January next—the car capacity of the road being about 160 cars, embracing all kinds.

There are now within the borders of the county about 17 miles in length of track belonging to this road.

The various wood and lumber flumes are engaged to their utmost capacity, while the mills for manufacturing and preparing lumber for the market are in constant employment.

The quartz crushing mills in this county are located on the Carson river, at and near Empire City, in the eastern portion of the county.

The Mexican mill, located at Empire City, is worked by water power, superintended by D. B. Lyman, has 44 stamps, 20 pans and 10 settlers, and works 120 tons of ore in 24 hours; is now at work on Crown Point rock, with an average yield of $45 per ton.

The Yellow Jacket mill, located at Empire City, is worked by steam power and superintended by John Hanson; its capacity is 40 stamps, but only 25 are in use, with 13 pans, 6 settlers, and crushes 75 tons of Crown Point rock per day, with the average yield of $45 per ton.

The Brunswick mill, worked by water power, is located on the Carson river, about two miles below Empire City, under the superintendence of M. R. Elstner. Its capacity is 53 stamps, 26 pans, 13 settlers, and 4 agitators; crushes 150 tons of Crown Point rock daily, which yields $45 per ton.

The Merrimac mill, worked by water power, has 20 stamps, 13 pans, and 6 settlers, with capacity to work 45 tons of ore per day; has been working on slum and tailings for some months past, under the superintendence of Frank McCollough.

The Vivian mill, propelled by water power, under the superintendence of D. H. Brown; has 16 stamps, 8 pans and 7 settlers, capable of crushing 40 tons of ore per day; not at work at the present time.

The Santiago mill, worked by water power, under the superintendence of D. C. McKay, has 34 stamps, 9 settlers and 18 pans, and works 80 tons per day, on Belcher ore, with an average yield of $36 per ton.

Monster Beehives.

A correspondent of the *Commercial Herald* gives the following description of a monster beehive on the eastern slope of the San Fernando range, Los Angeles county, Cal.:

The hive is located in a rift, which penetrates the rock to the depth of, probably, one hundred and sixty feet. The orifice is thirty feet long and seventeen feet wide; four passages. This rift was discovered to be the abiding place of a swarm of bees, that is represented as coming out in a nearly solid column, one foot in diameter. Certain parties have endeavored to descend to the store of honey collected by these bees, but were invariably driven back, and one man lost his life in the effort. Others have, at the expense of much labor and money, built a scaffold one hundred and twenty-five feet high, in the hope of reaching a place whence they could run a drift into the rock, and extract its well hoarded sweets, but finally ceased their work. Within four years the bees have added not less than fifteen feet to their treasure, as ascertained by actual measurement, and it is thought that at the present time there can be no less than eight or ten tons of honey in the rock. A man named B. Brophy, who lives in a cabin not far from the spot, obtains from the melting of the honey by the sun's heat, more than enough for his family requirements.

He hath riches sufficient who hath enough to be charitable.

Useful Information.

The New York Underground Railroad.

The delay in undertaking the construction of the underground railway, for which Mr. Vanderbilt obtained a charter last winter, is attributed to the difficulty experienced by the projectors of the enterprise in obtaining right of way at 56th street. At this point the underground road will unite with the Harlem road, which, according to the plans that have been adopted for improving its present condition, will be several feet above the street level. To this the property holders in the neighborhood object, and insist that not only shall the tracks be sunk below the level of the street, but also the depot which is to be erected at this point for the temporary terminus. Until these demands are complied with, the owners refuse to part with their property, as they hold that the present arrangements will endanger the lives of the citizens. Negotiations are now making to obtain control of this property, and, if there are a few changes made in the original design, they are likely to be successful.

Difficulties have also arisen in regard to some property required in the vicinity of the Five Points. Here, however, the trouble is a question of price; but commissioners will be appointed to appraise the property in question, and their decision will, of course, be final.

It is expected that nearly 3 years will be required to complete the road, and when the difficulties to be overcome are taken into consideration, the time is by no means too long. Between 13th and 18th streets, the road must be tunnelled through solid rock, and when the present tunnel through Murray Hill is reached, the entire flooring must be undermined, for the underground road will pass directly under it. The new road will be on an average 3 feet below the surface of the streets; the tracks will be 19 feet below, and the arched covering will be 2 feet in thickness throughout. This will give the interior of the tunnel a hight of 14 feet.

The terminus of this new road, coming as it does within but a few feet of the new Post Office, it has been suggested that the tunnel be continued into the basement of that building. This plan has been regarded favorably by the government architect, and the foundations on the north side of the building have been constructed in accordance with it, so that at any time the connection can be made. By this plan, all mails arriving over the Hudson River, New York Central, or Albany roads can be sent direct to the Post Office by steam, and thus avoid the innumerable delays that now occur in the delivery of the mails to the wagons, and their subsequent driving through the city. If this arrangement is made, these mails can be delivered very much earlier, and the departing mails can be kept open later than at present.

Pure Iron.—It is a remarkable fact that pure iron is an article unknown. What is called iron is a mettle combined or associated with other elements, which, though present only in small quantity, may, according to their number and proportion, communicate to it widely different properties—it being a simple variation in the proportion of carbon, say within the limit of about five per cent., which causes the metal to appear in the three well known states of wrought iron, steel, and cast iron, and just as the proportion of carbon increases the metal passes insensibly through these successive stages. One part in a thousand of any one of these elements will produce a decided effect on the quality of the iron, either separately or combined; hence the endless diversity in quality of the iron, steel, and pig iron met with in commerce. So far as our knowledge extends, iron is the only metal which is capable of thus acquiring such varied and useful properties by the operation of such simple and apparently trivial causes.

Curiosities of Motion.—Is any change produced on a man by a change in the velocity of his motion round the axis of the earth? If a dweller in latitude 60 degrees were suddenly to change his residence to the equator, he would double his velocity. At latitude 60 degrees he travels round with the earth at the rate of 500 miles an hour; at the equator, 1,000 miles an hour. Again, at latitude 72 degrees the Greenlander is lazily carried round 130 miles an hour; while the man at the North Pole calmly revolves once in 24 hours. Of course the motion is unfelt, because all things move together; but the change from the tropical to an arctic climate is so great that it may possibly produce physical or mental effects of which we are as yet unconscious. Of course the steering of a ship from north to south must be sensibly affected by the constant acceleration from west to east. On the long railways of Russia, too, it is said that the rails are uniformly more worn on one side than on the other, in consequence of this force.—*Boston Journal of Chemistry.*

In order to prevent the ebullition of boiling liquids a small fragment of sodium amalgam or of sodium tin, is added, when the solution is acid. The efficacy of these depends on the evolution of a small amount of hydrogen during the process.—*Dingler's Polytech. Journal.*

The brittleness of drawn wire may be obviated in a short time by subjecting it to a glowing heat or it loses this at the ordinary temperature within two to four months.—*Oesterreich Ztsch.*

Prevalence of Dust.

Dust is such a thorough Paul Pry, so intrusive, so all-pervading, that there is some foundation for Night Thought Young's hypothesis of a universe of dust, except that each particular atom does not dance, as he imagined, according to its own devices, but according to law. The air on the top of Mount Blanc contains dust; but the acme and concentration of dirt is the atmosphere of London, enveloped by which it is impossible for anybody to be quite clean, outside or in. Solar light, in passing through a dark room, reveals its track by illuminating the dust floating in the air; if there were no dust, no track would be visible. Professor Tyndall, who has a keen eye for the beautiful, says that on a day of transient shadows, there was something almost magical in the rise and dissolution of the luminous beams among the scaffolding poles of the Royal Albert Hall, in London.

Dust is the cause of the lovely color of the azure firmament. In fact, sky-blue may be produced by exceedingly minute particles of any kind of matter. To the same cause are to be ascribed the effects by which distance lends enchantment to the view. Professor Tyndall makes an artificial sky more perfect than a real one. In mountainous countries hills at no great distance are rendered almost invisible by haze. It will be understood that it is not the interposition of the haze as an opaque body that renders the mountains indistinct, but that it is the light of the haze which dims and bewilders the eye, and thus weakens the definition of the objects seen through it. Artists take notice of these phenomena under the name of aerial perspective. The haze varies with the temperature and humidity of the atmosphere. At certain times and places it is almost as blue as the sky itself, but to see its color the attention must be withdrawn from the mountains and from the trees which cover them. In point of fact, the haze is a piece of more or less perfect sky; it is produced in the same manner, and is subject to the same laws as the firmament itself. We live in the sky, not under it; and the "blue arch" turns out to be a greater delusion than was imagined.—*Ex.*

Insect Life in a Coal Pit.—Of late, the miners employed at Muiredge Coal Pit, a little to the north of Buckhaven, and on the Vemyss estate, have felt considerable annoyance in consequence of large-winged insects fluttering around the flames of their lamps and often extinguishing them. A miner, named William Semble, had his attention directed to several gimlet-like holes in the wooden props that support the workings, and, on closely examining the same, discovered live moth-like insects in the cavities. They are evidently foreigners. The wood of which the props were made came from abroad, and they have been in the pit for between three and four years. The insects are, in many cases, just emerging from their birth places into active life underground, and resemble wasps, but are not altogether like those in this country.—*English paper.*

A Solvent for Shellac.—Dr. I. Walz describes the following process for obtaining a neutral solution of shellac in water. The shellac is broken up and covered with a concentrated solution of carbonate of ammonia, and boiled upon the water bath until the ammoniacal smell has disappeared. More of the solution is added, and the boiling is continued until the shellac forms a coherent, sponge-like mass. The carbonate of ammonia is then expelled by further boiling, and the mass will readily dissolve by pouring boiling water upon it. A kind of soap will be found floating on the surface, which may readily be removed by straining. The solution, brought on paper, cloth, etc., dries rapidly, and leaves a thin, lustrous and adherent film of shellac behind.

Experiments in Exploding Dynamite.—Certain experiments recently conducted with dynamite, in France, lead to the conclusion that the condition under which this explosive is employed exercises a most important effect upon its value as an explosive agent in engineering. These experiments indicated that when the match entered deeply into the cartridge, the dynamite simply burned without explosion. It was further observed that when the match but slightly entered the cartridge, the explosion was in all respects satisfactory, and that nothing was left to be desired when the cartridge was primed with fulminating mercury.

Irradiation of Light.—It is a curious fact, that if the same letters of the same size precisely are painted on two boards, the one white on a black ground, and the other black on a white ground, that the white letters will appear larger, and be read at a greater distance than the black. This is owing to what is called the irradiation of light. It depends on this: That the impression made on the bottom of the eye by bright objects extends a little wider than the actual portion of the organ struck by the light, and, invading the space occupied by the darker objects, makes the brighter appear larger than they really are.

Sweet Fern for Tanning.—Thousands of acres of land in Michigan are covered with a growth of sweet fern, which has hitherto been supposed to be worthless, but it has been found that for tanning purposes it is unequalled, and that it yields forty per cent. extract, while hemlock yields but fourteen. It promises to be very valuable.

Good Health.

Locality and Cause of Ague and Fever.

Intermittent fever is known to prevail (except in sporadic cases) only is districts where there is a large amount of vegetable matter in a state of decomposition, and this occurs more especially in times of drouth. In dry seasons rotting wood and other vegetation, usually innocuous because under water, is exposed to the atmosphere, which it taints with the emanations of decay. We have no evidence that any amount of decaying vegetable matter on a dry soil, though it may be very unwholesome, is especially conducive to the intermittent form of fever. Moisture is an essential factor in the causes. But all swampy lands are more or less productive of this type of fever in dry seasons, and the prevalence of intermittents in their vicinities always corresponds with the quantity of decaying organic matter.

Another source of the disease not often thought of, and seldom alluded to in medical books is rotting wood and other decaying vegetable matter in the cellars and door-yards of houses which are situated in damp places. If wood, or any other decaying vegetable matter, and water are allowed to accumulate in the immediate vicinity of houses or stables, the water will become stagnant, and malarial gases will be generated, causing intermittent fever in the occupants of the houses, and a more obscure, though analogous affection in the domestic animals.

The malaria of swamps and other places is sometimes carried, mostly in a given direction, by the prevailing winds or breezes, so that persons residing a mile or two distant, and in high altitudes and salubrious localities, are more subject to intermittent fever than are those who reside in their immediate vicinity. It is, therefore, of much importance in the neighborhood of malarious places, or districts subject to this disease, to ascertain the prevailing atmospheric currents before constructing buildings, either for human beings or animals.

It may be an interesting question with many who are obliged to reside in malarious localities, at what hours of the day or night is the atmosphere best or worst? There can be no doubt, I think, that early and late in the day are the worst times to be exposed. From day-dawn until a little after sunrise (and still later in cloudy or damp weather), and from sunset until a little after dark, the air is damper, heavier and more loaded with malarial emanations, which the sunshine and heat of the day dissipate and destroy, and which the colder air of the night condenses and keeps down to the surface of the earth. Those who live near any source of pestilential miasma would do well, as a preventative measure, to avoid exposure as much as possible during the hours above indicated.

But it may be said that persons must breathe such air as surrounds them; that the malaria will pervade the indoor as well as the outdoor atmosphere; and that, therefore, nothing is gained by remaining within. The objection is well taken; but by keeping the air of the apartments occupied during the above hours warm and dry with a brisk fire (even though the time be July or August and the thermometer at fever heat), the objection will be obviated.

Treatment.

The main point and the universal rule in medicating all cases is: to keep the temperature and circulation as nearly balanced as possible during all stages of the paroxysm. On the first appearance of the symptoms of the cold stage, the patient should have hot fomentations applied to the abdomen, bottles of warm water or something equivalent to the sides and armpits, and warm applications to the feet. By these means the duration of the cold stage will be lessened, the severity of the hot stage diminished, and the entire paroxysm abbreviated and rendered milder.—*Phrenological Journal.*

An Effect of Chloroform.—A singular effect which chloroform has upon some persons is its dulling the brain and destroying the intellectual faculties for months after it has been taken, and after physical health has been restored. One gentleman of active mind, a ready thinker and fluent writer, might be named who has been under the influence of chloroform three or four times for surgical purposes, and each time his intellect has been torpid for months, though his surgical recovery was rapid. *Scientific American.*

A Remedy for Dysentery.—The following simple remedy has been known to cure the most obstinate and malignant forms of dysentery, when all the ordinary methods were ineffectual. Take hot water, one-fourth of a pint; vinegar, half pint; mix; then continue to add common salt as long as it will be dissolved, stirring and irritating it freely and frequently.

More men grow old from having nothing to do, than from over-work. The running machine will keep bright for years—the idle machine will soon rust out.

Quack Doctors.

From every section of the country we are constantly receiving intelligence of the most foul murders having been committed by men calling themselves doctors. There is nothing about which the great mass of the people are so ignorant as the human system, and the means necessary to preserve it in a state of health, or relieve it from disease.

Knowing this, unprincipled men, and women too, who have become so depraved and dead to the instincts of humanity that they are willing to jeopardize the lives of fellow-beings that they may obtain money, put forth their signs as doctors, flood the country with circulars and advertisements filled with accounts of their unprecedented skill, and the work of death commences. A considerable portion of the people have educated themselves that everything they see in print is true. They read these quack advertisements, which are gotten up to order by uninterested parties (for be it known that quacks, as a rule, cannot write) and are at once struck dumb with astonishment to think that such wonderful physicians have by chance been thrown within their reach. They rush to these quacks by the thousand, and are assured that their cases, though very critical, can be cured only by careful treatment by them. The prices charged are fabulous, and the poor victims rob their families of the necessaries of life, and mortgage their property to raise money to pay the impostors. In most cases they are given harmless compounds, and are fed on hope until their money is exhausted; then they are turned away—kicked into the streets, with the information that their cases are beyond remedy. The more adventurous charlatans experiment with strong drugs, and knowing nothing of their effects upon the human body, accidental deaths are frequently the result. Numerous instances have occurred where good-paying patients, after being copiously bled of their finances, have suddenly gone to their long home.—*Ex.*

How the English Bring up Children.

The English bring up their children very differently from the manner in which we bring up ours. They have an abundance of outdoor air every day when it is possible. The nursery maids are expected to take all the children out airing every day, even the infants. This custom is becoming more prevalent in this country, and should be pursued wherever it is practicable. Infants should be early accustomed to the open air. We confine them too much and heat them too much for a vigorous growth. One of the finest features of the London parks is said to be crowds of nursery maids with their groups of healthy children. It is so with the promenades of our large cities to a great extent, but is less common in our country towns than it should be.

In consequence of their training, English girls acquire the habit of walking that accompanies them through life, and gives them a healthier middle life than our women enjoy. They are not fatigued with a walk of five miles, and are not ashamed to wear, when walking, thick soled shoes, fitted for the dampness they must encounter. Half of the consumptive feebleness of our girls result from the thin shoes they wear, and the cold feet they must necessarily have. English children especially girls, are kept in the nursery and excluded from fashionable society and all the frivolities of dress, at the age when our girls are in the heat of flirtation and are thinking of nothing but fashionable life.—*Ohio Farmer.*

Remedial Mud.—"Grace Greenwood" has been astonishing the people "down East" by the accounts of the mud-baths which she has seen or heard of during her late travels on the Pacific coast. Mud-bathe are said to be a popular remedy with certain uncivilized copper-colored savages. The barbarous beings, when sick are said to burrow in the mud, very much as certain nameless scavenger quadrupeds do in civilized countries, of a hot day, whenever they can find a puddle large enough. Some of our contemporaries seem to think that a prescription that is good for pigs is for that very reason bad for humans. But we beg leave to differ. A cleansing, or cooling, or other remedial process may be equally applicable whether the patient be hog or the "higher animal." At first thought there may be something vividly suggestive of dirtiness in the idea of mud-bathing. But we are prepared to show that mudopathy is just the cleanest treatment in existence. The reader is respectfully requested not to confound the idea of mud-medication with mud-spattering. No one would like to have mud thrown into his face nor on his clothes; and he would resent a similar application of water. Yet, instrinsically, nothing is cleaner than earth, nothing purer than water; and the admixture of the two constitutes mud.—*Science of Health,*

Buttermilk is an aid to the digestion of any food taken with it; and by many hygienists is regarded as an excellent substitute for fruit in Winter, and a prevention of Spring sickness. It is especially recommended to invalids who suffer from indigestion—drink it at meal times,

MINING AND SCIENTIFIC PRESS.

MECHANICS' INSTITUTE.—It is announced that the popular lecturss decided npon hy ths Board of Regents and the Mechanics' Instituts, ths programme of which we published recsntly, will bs hsld on Saturday svenings during the wintsr. A small fee will be charged—$1 for fourtesn lectures or ahout seven cents psr lsctnrs—to dsfray sxpenses. These lectures have prsviously proved very satisfactory and linstructive and, with the very comprehensive programme proposed, will probahly be even better than formerly.

PROFESSOR TYNDALL.—A subscribsr signing himeslf G. L. P., requeets ne to call the attention of the Mechenics' Institute to the propriety of ohtaining the presence of Professor Tyndall on this coast. We are happy to say that ths Institute has forestalled our correspondent, for by order of the Board of Truetece President Hellidie hae placed himself in communicetion with Professor Tyndall in order to secure from him a series of lectures in this city. It is to he hoped that the Inetitute will hold out sufficisnt inducement to the gentleman to visit Sen Francisco, for ws are eure that eftsr ths appreciative reception of Profeesor Agaesiz, any other light of the scientific world will be heartily welcomed and attentively listsned to.

TIN.—A rumor is prevalent in ths city that rich deposits of tin have been discovered near hers. The discovery of tin ore anywhere on this Coaet, in peying quentities, would be of the greatest importaancs, hut we fear the newe is too good to be true. Nothing definite ie known as yet, hnt we have heerd of so many bogue tin diecoveries that ws are inclined to he skeptical nntil good proofe are shown.

GOVERNOR BOOTH hae appointed Thnrsday, ths 28th of Novembsr, ae a day of Thanksgiving for California—the same day which had been previously fixed upon hy Prseident Grant as the day of National Thanksgiving.

ON FILE.—Letter from C. F. J., from Tintic Dietrict, Utah; also letter from Pioche.

The Raymond & Ely Mining Suit.

Ths Raymond & Ely mine is in troubls. Let auy mins hecoms a prosperous one, and it is surs to get into soms kind of litigation. We seldom heer of eny trouble ahont third rate mining property, but just as soon as a mine proves its worth and hecomes a representetive of its district then is the tims for soms one to step in with some claim upon it, which would otherwiss havs never besn thought of. This particular suit will, liks others before it, he decided hy the Courts, which of course have a hetter opportunity of judging of ths msrits of ths case than any one outsids has. Moreover, we know nothing of ths claims further than what the affidavits averr still it ssems very provoking that ths only mins of prominence of all the great number called at ths Stock Board which has paid any dividend for the pest thres monhts, should be even temporerily deterred from so doing this month, hy an injunction from the Court. More or lsss litigation, however, was expected to spring out of the stete of things in Ely District sincs it is infested with "soldier titles," and a good deal of property is in dispute. Mr. Raymond, United States Commissioner, who recsntly peid a visit to this district, says that he is sure there is not a mining company there, concerning which he has not heen wisely assured hy some knowing outsider thet, "in reality, sir, thsy don't own a foot of their own ground." This is surely a dsplorabls state of effairs, but it is nevertheless hettsr for such mines as have auy hopes of heing first-class ones to settle their difficulties hefore the value is enhanced hy increased bullion product.

This suit involves a large amount of property, the cleim heing for upwards of $1,500,000. As steted in a former issue, C. F. McDermott instituted suit against ths Company, alleging that he was a tenant in common with ths defsndant, and owned 800 feet undivided of 1350 feet of the Panaca lode, on Ely Miuing District. He further allegsd thet ths Company had excluded him, and misappropriated the proceeds of the mins, sxceeding the sum of $1,500,000. This has now almost reached ths sum of $2,000,000. The suit has been going on for soms time, hut as is usuel iu preliminery legel procsedings, attracted but little attention until it assumed its prssent phase. A few weeks sincs the demurrer to ths complaint was argued, ths defendaut demurring to ths complaint on the ground thet one tenant in common could not hring his bill for accounting in equity, and that the Court had no jurisdiction, the ground heing in the State of Nsvade.

Befors this argument wes concluded the Compeny declared its nsual dividend of $7 per share, amounting in all to $210,000, which was to have been paid on the 11th inst. Bsfore this emount could be disbursed ths plaintiff procured en order from the Judgs, which was served on the Presidsnt of the Company requiring the Compeny to show cause why an injunction should not be served, restraining them from paying ths dividend announced, or any dividsnd at all, while the suit was pending. The payment of the dividend was therefore postponed until the demurrer was argusd. After this was done the case was submitted, and on the 13th, Judge McKinstry sustained the demurrer end dissolved the restraining order; so the dividend hes been paid.

The hasis of McDermott'e claim to a shere of the proceeds may hs seen by the following:

Whsn Piochs, or Ely District, was diecovsred, the discovery, or Williem Hamhlin claim, of 200 fset on the ledgs was the first one located. Next on the west ceme the claim of —— Pulsifer, end then in proper order those of Thomes Box, Thomas M. Box, Stephen Sherwood, J. N. Vandermark, and S. S. Shutt, sach 200 feet, except Pulsifer's, which was 150 fest, making in all 1,350 feet. In July, 1864, these men agreed to consolidate their claims in ons company, each to hold an undivided interest. In this agreement they were each to have en equal proportion of the proceede of ore from any or all cleims; hut at the seme time each hed power to dispose of hie own proportion of the ground, as he saw fit, without the consent of others. Thie agreement was signed and recorded. About two yeare since, Raymond and others hought the William Hamhlin claim, organized the Raymoud & Ely Company, which afterwards hought the Pulsifer claim, next adjoining, and worked it as their property. Both locations proved very rich, as the large and eteady dividends of the company show. Three of the other owners meanwhile hsld on to their claims, and recsntly sold out to McDermott, who, undsr ths terms of the ahovs-mentionsd agresmeut, desires a shars of the profits of ths Reymond & Ely Company. Hs claims thet in purchasing the Pulsifer ground ths company did not buy the whole, hut only ninety thirteen hundred and fiftieths, and ths rest is ths property of ths original consolidation. As McDermott has purchased the rights of ths other claimants and whatevsr portions of ths Hemhlin and Pulsifsr trects the original ownsrs may cleim, he claims 800 feet of 1,350.

On sustaining ths dsmurrsr and dissolving the order rsstraining the payment of the dividend hy the company on Tuesdey, Judge McKinstry decided that the poiut teken by the defendants as to ths jurisdiction of the Court was well taken. This point was that one tenent in common could not hring hie bill for accounting in equity, end that ths Court hed no jurisdiction, the ground being in Nevade.

The Judge said thet the plaintiff sst up in his original hill that he was a tenant in common with the Raymond & Ely mine, but that the latter held adverse possession—*i. e.*, would not let ths plaintiff enter his possssion of that portion of ths property which he cleims as his. Suhsequently he loses sight of his latter position, and says that he is an acknowledged tenant in common and is only suing for a division of the profits, of which his portion has heen legally withheld. This creatss an inconsistency in the record. If ths latter position wers true, ths cess would bs a proper ons to bring hefore the court; hut as ths tenantcy in common is denied it hecomes necsssary to make proof of ths fact, and that can only be dons in a Court having jurisdiction, *i. e.*, a Court in ths State of Nevada. The proper courss to pursus is to hring an actiou for sjectment in Neveda.

It is uuderstood that ths plaiutiff will push the suit and prohably a suit in ejectment will he commenced in Nevada to ohtain possessiou of thet part of the mins which is alleged to bs owned by him.

Our Home Industries—The Foundries.

Ths city foundries have had their hends full of work for the pest few months, but business is now beginning to slack np a little on eccount of the approech of winter. The high price of iron has somewhet affected their work, hut pig iron has come down considerably of lete and made it easier. Rolled and har iron is, however, very high and retards business metsrially since consumsrs will mske their mechinery, etc., last as long as possible to avoid purchesing at high rates, when if they wers rsesonahle, more repairs and new machinsry would be ordered. Ths foundrymsn all appear to he in good spirits over the rssult of ths season's businsss aud thers is plenty of work in the shops to keep thsm husy for some tims. The past eix monthe has heen the most proeperous for a numher of years, end although business has not decreased mnch as yet, it looks as if it would. At the

Risdon Iron and Locomolive Works

A largs force of men is employed and everything looke prosperoue. These worke have the contrect for the building of two veseels and engines, the result of which will he importent to our coast. One of them ie a eteemer for the transportation of coal from Orsgon—500 tons burden; engiue 34x30, with all modern improvements. The other ie a steamer for the Revenus eervice, of 235 tons; engine 34x34. One of these vessels is heing huilt to tsst the qusstion whethsr coal can he transported by steem cheaper then hy sail. It is probahle that if the experiment is successful other vessels will hs huilt for the eame purpoee and kept running on ths coast. The veesel heing huilt for the Revenue ssrvice is to solve the question whether California mechanics and California meterial and lumher will meke ae good a ehip as can he huilt in the East. The carpenter work is being done by Dickie Bros., but the Risdon Iron Worke heve the contrect for ths whole joh and we are glad that ths work ie in such ahle hands.

At thie foundry they are also refittiug the steamer "Prince Alfred" and putting in a new surfacs condenser of the most approved etyle and putting a new surfacs condenser, for fresh water alone, into the steamer "Buhne," giving her a general overhauling. Thie firm has just completed five of the heavieet hoisting engines on the Comstock lode, and also two on the Sutro tunnsl—capeble of hoisting from a depth of 2,000 fest. Thsre has just heen shipped a 30-stemp quartz mill for the Sierra Butte mine, driven by a new kind of tangentiel turbins wheel made after the first ons huilt six months ago, which on au extended trial hes proved so very satisfactory as to warrant them in adopting this style of wheel in preferencs to any other. Another tangential turhine wheel is also heing huilt here for ths Originel Amedor mill. One hoisting engins 12x24 for the Ivanhos, ons for the Phœnix, one for the Eris and ons for ths Original Amador mine. A lerge and complete quartz mill, for the Floral Mill at Pioche; also, 25 cars for ths Central Nsvada Railroad. A very hsavy pumping engins is bsing mads for ths Imperial mine, Washoe, capahls of pumping from a depth of 3,000 feet. The hed plats of this engine alone weighs 1,800 pounds, and the two geers for pumping will weigh 1,800 eech. Two incline cages, made on a new principle of adjustahle bottom, ers being constructed for ths Ideho mine, Grass Vallsy. These ars some of ths mein jobs on hand, but they ere meny other smeller ones of the sams class. The Risdon Iron and Locomotive Works have due a number of the largest class tools mads, and are fitting up to mest the ordsrs for the largest class of machinery likely to be ordered.

At the Miners' Foundry

They are building a 20-stemp mill to go to Celeveras Connty. They are also putting up three of Paul's Amalgamating Mills to work hy the Paul process, one of which goes to Austrelia, oue to Uteh, end ons to Nevede. There are three of these mills now in operetion on this coast. They havs just finished thrse Goodwin & West pumps, the one which received a gold medal at ths last Stets Fair. Thess are ell intsnded for deep mining purposes, ons for ths Crescent City mine, Plumas county, ous for the Vallsy Mining Company, Nepa county, and the other to Virginia City for the Crown Point mill. We notice that they are making a small sizs of this pump for household and farming purposes. Thsy are constructing at this foundry some machinery to be used iu this city for ths manufacture of whits lead. Also making a tunneling machins for cutting tunnels seven feet in diameter, aud from that down. This mechins cuts a circls outside and a hole in the middle, iu which a blast is put. At this foundry, thsy, like all ths others, have heen running full for the pest six months.

The Etna Iron Works

Ars at work putting up a largs steam plow, Hyde's petent; huilding house front for Tallant's nsw hank building. They ers also arrenging steem machinery for plowing tule lands near Sherman Island. This is on the sams principls es that illustrated in the PRESS recently, sxcept that only one sngine is nsed on one side of ths field, and a clip pulley on the other, so thet ths plow is drawn hack and forth hetween them. They are constructing a numher of Varney pans, and mixing machinery for the Bay Sngar Refinery; also doing flour mill work for W. D. Tullock at Knight's Ferry. They ere building a White's furnace to go to Utah, the tenth put up at this foundry. They are making shafting and pulleys for ths Navy Yard, and doing the nsual amount of miecelleneous johbing.

The San Francisco Boiler Works

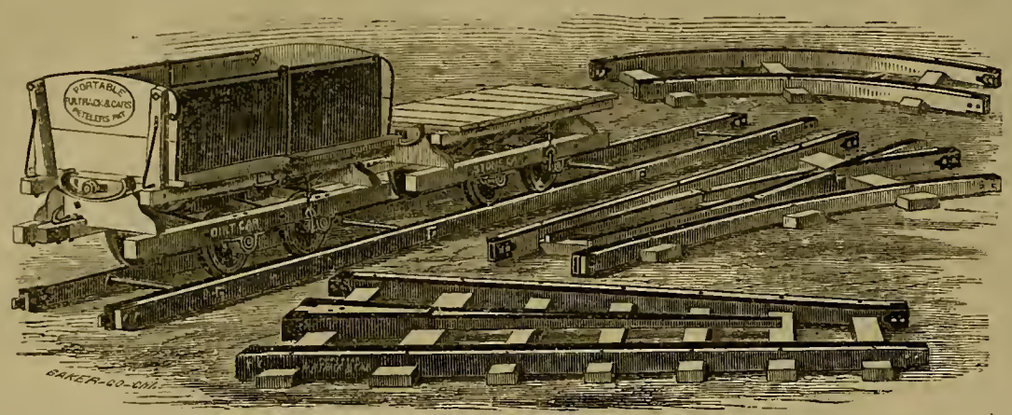
Are constructing two boilers for the Original Amador mine, 50x16, with all appurtenances, heater, stc; two boilers for the Erie mine, seme as above, and two for the Markley mine of a similer size; also meking two boilere of the eame sizs for the Black Bear mine, which is made in sections for convenience in shipment. A largs flus boiler, 60x26, is being made for T. Lemmen Myer & Co., to go to Mexico; two hoilers 48x16 for the Bellinghan Bey Coal Co.; two hoilere, 52x16 for the Bay View Distillery; and one hoiler for Huntington'e ehingls machine, 42x12, all complete.

A very large, low-pressure, marine boiler ie being conetructed for the eteemer Pelicau, which ie 13 feet in diameter of shell, 21 feet 6 in. in extreme length; diemeter of eteam chimney, 7 feet 2 inches; hight of steem chimney 7 feet 6 inches; containing three furnaces. Juet completed two hoilere for the Steam Plow Propelling Company. In addition, they are making 200 three-wheeled eugar wagone, 4 feet square hy 2 feet deep, for the eugar refinery; aud welding hoiler tubes for the Pacific mail Steamship Company and the North Pacific Transportation Company.

We will mention the work going on at the other foundries in next week's issue, our report being unusually long.

The Peteler Portable Railroad.

The illnstrations shown represent the manner in which the Peteler railroad is operated and its adaptibility for the work for which it is intended. It is more specially nsed for bnilding railroads, making excavations, filling low grades, for work in quarries, on farms, etc. In many localities in our mining regions it wonld he fonnd of great utility when large quantities of dirt are to bs removed. It can he used of course in all weather, and ia light and at the same time durable, and is so arranged that it can be operated without requiring any particular akill. It is generally estimated that it reqnires three drivers, three horses and three carts to movs one cnbic yard of earth, bnt admitting that two of each can do it, it will therefore take ten horses, tsn drivers and ten carts to movs five cubic yards of earth.



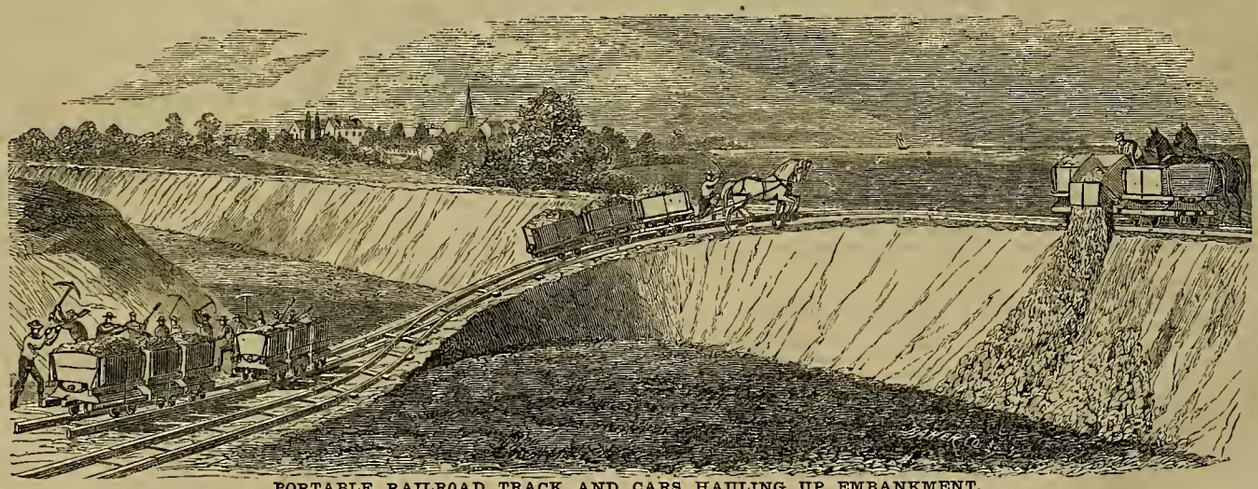
DIRT CAR. STONE CAR. SWITCH SECTIONS. CURVED SECTIONS.

Whils a No. 3 of the above portsbls track and cars, on a level grade, it is claimed one driver and one horss will move five, sometimes six cars, each containing a cnbic yard.

There are sixteen wheelbarrow loads of earth in a cubic yard, it therefore requires sixtesn msn with sixteen barrows to move it, or one man mnst go to and fro thirty-two times to do so. With a No. 1 half yard car and No. 1 track of this construction one man in one journey can move half a yard of sand or earth. The economy therefore in the saving of lahor, time and expense is evident. The main track is made up of twenty feet sections, each consisting of two parallel wooden rails hound together at proper distances by cross ties with a strong screw-tie bolt passing through each, and also with strong iron bolts to fit in the sockets secured on the end of the rails, snd all securely bonnd together. To the upper snrface of these wooden rails is rivited a strap of wrought iron, oval on its upper surfacs, on this the car wheels run. Short pieces, curves, cross roads, turn tables, etc,, are also provided.

GAUGE OF TRACK SIXTEEN TO THIRTY INCHES.

Ths rails are laid on the snrface of the ground, without sleepers, and with great rapidity. For short distances the cara can hs moved by hand. On a track one horse usnally hanls fivs cars. On down grades a horse is only necessary to hring the empty cars back. The track with all its appliances can bs easily transported in common wagons or railroad cars. To complete the road, curves, branch-roads, frogs and tnrn-tables are addsd, whereby the road can assume everywhere and at all times ths reqnired form and shape. For the purpose of transporting, various kinds of cars are used, of a form snited to ths different purposss for which they are employed, and being light and strong, they can be readily transported to any desired locality, and be ussd on stsep grades without difficnlty.



PORTABLE RAILROAD TRACK AND CARS HAULING UP EMBANKMENT.

The railroad conld, we think, be used to great sdvantage in onr monntsinous districts for many pnrposes, snd ahont mining property wonld bs extremely convenisnt. The csrs sre constructed with referencs to lightnsss, strength and fscility of handling and nnloading. Its sdvantages are not limited to transportation of material by man power, or as a snbstitute for wheelharrows. In hauling by horses, one horse csn be made to do the work accomplished by many, as will be seen from the fact that it requires about twenty times the power to drawa load on a gravel road that is required on a railroad. For further particulars those interestsd may andress the Peteler Portabls Railroad Co., 42 Broadway, New York,

American Flat Tunnel.—The workmen engaged in retimbering this tunnel, which was burned out a short time since, are making rapid progress and the work will be completed shortly. The accident to the tunnel has seriously interfered with work in the Comstock mines, cutting off supplies of timber and fnel, and numbers of miners wers discharged in consequence.

The Crown Point and Belcher dividends were passed again this month, contrary to expectation.

Future Course of American Trade.—To judge by the magnitnde of our imports and exports ws ars entering on a csreer of nnprecedented prosperity as a nation. Hitherto, though, our trads has lain chiefly in the direction of England and Frsnce. But ths immense development of our mannfactnres and industrial resonrces will change tho current of trado altogethsr. West of us we havs a continent waiting for our manufactures. There in the fntnre our trade mnst lie. But we must have an outlet for it, and to have it ths trads uniting the two countries must be secured hy a csnal which shall unite the Atlantic with the Pacific, and which shall bring the rsmotest part of our territory within two months of China and Japan.

Scientific Lectures.—Ths Sunday evening course of geological lectnres being delivered by Prof. Joseph Le Conte, of the State University, at Rev. L. Hamilton's Church, in Oakland, has been interrupted by the Professor's illness. We are pleased to learn, however, that he is convalescent, and has resumed his interesting and appropriate discourses.

The Sacramento and Vallejo railroad is being put in excellent condition hy snbstantial trestlings wherever the floods of last winter carried away the embankments.

Representative to the World's Fair at Vienna.

Guido Kustel, M. E., of San Francisco, well known as the author of ssversl of the latest snd best hooks pnblished in America on Mining snd Metallurgy, has been appointed by the Mechanics' Institute of this city, as Commissioner to the Vienna Fair, which opens in May next. Mr. Knstel is hoth a scientific and practical man, thoronghly interested in, and well acquainted with, the industries of this Coast. A native of Gslicia, in the Austrian Empire, Mr. Kustel has been for the past twenty years a resident of this Coast. His education, experience and observations, in this and other countries, together with his long and constant identification with California, render him eminently suited for this appointment, which we consider a pecnliarly fortnnate one. It is his intention to leave for Enrope early in the winter, snd we would urge thoss who are willing to frnish articlcs for exhihition to correspond at once with the Commissioner. Until further arrangements are made he can bs addrssed, care of this office. Packages for the Exhibition must he prepaid to this city. They will be forwarded from here and exhihited free. We urge npon onr inventors, miners and farmers, to do their best to make a good showing for California at this Exhibition, which is one worthy of mnch greater attention than it has yet received in the United States. We shall speak more fully of it hereafter.

Mineral Wealth in the Indian Country.—The scientific and exploring expedition which left Wssh-ington last May, under command of Colonel W. C. McCarty, of Texss, for the pnrpose of exploring Northwestern Texas, has retnrned, after a successful trip of five months in the Indian country. Copper ore has been fonnd in large qnantities of a very snperior qnality, having assayed as high as eighty-four per cent. of copper, the remainder being silver and other matter. The coal discovered is also of a snperior nality, resembling the best Pennsylvania anthracits. The Great Sonthern Pacific Railroad and the Pacific and Great Eastern Railroad pass through or near these banks. Colonel McCarty is now fitting ont a more extensivs expedition, to penetrate what is known ss ths "Llano Estacado" or "Staked Plains," and thence through the eastern mountain range of Northwestern Texas, and will leave New York about the 1st of Novemher.

San Diego Foundry.—Measures are on foot for the establishment of a foundry in the neighborhood of San Diego, and we understand that a portion of the machinery has already been shipped.

Ely District and Its Mines.

A *Bulletin* corrsspondent writee as follows from Pioche, Ely District, Nevada, under date of Oct. 31:

In no district west of the Rocky Mounteins has vein mining provsd more succeesful and gsnerally satisfactory than hsre—a fact that tends somswhat to relieve the businsss from tbe distrust with which it has come to be eo justly regarded. Few mines elsewbers have besn placsd so speedily and cheaply on a paying basis or afterwards been conductsd with euch economy and profit as the leading ones in this district. It is not yst quits three ysars sincs ths Meadow Valley, thsn the principal company hsre, commenced operations. Eight months were spent in a costly attempt at smelting the ores, for which purposs extensive works were erected on the ground, it being supposssd that they could hs successfully treated only by this mods of reduction. With greatsr depth attainsd in the mine, ths smslting orss gave place to others of a pnrer kind, requiring treatment by the mill process. About the middle of July, 1870, ths company completed a 20-stamp steam mill, but not for soms time after did this gst fairly at work, owing to causss of delay iucident to localities eo iealated and remote.

Up to the 1st of Angust, 1872, the income of ths company, including $210,000 raised from assssssmente, had amounted to $1,869,183, and their expsnditures to $1,657,910, of which $1,020,000 consisted of dividsnds paid etockholders—the nst profits realizsd by the latter during this tims having been $810,000. The Piochs, a much younger compauy, makes nsarly as good, and the Raymond & Ely a far better showing than this. To the latter must be accorded the merit of a specially good menegsment, this company having opsned and equippsd their mine from its own net procesds, no assssssmsnt svsr having been levied. Although tbsy had a 5-stamp mill up and running before the Msadow Valley Company, yet not much was accomplished prior to 1871, their bullion yield haviug been only about $400,000 previous to August 1st of that year. In ths precsding month of Jnne, very valuable discovsries wers made in thcir mins, whicb, from this time on, continusd to yield large quantities of high grads ore; ths total production to date having heen ovsr $4,500,000, of which more then onshalf has been clsar profit. The out turn for the currsnt year will reach about $3,500,000—the prospects of ths mins for continued and profitabls production bsing considsred better now than ever hsfors. Tbs aggregate yield of this district for the year will not bs less than $5,250,000, and may evsn excsed tbat sum, and it is safe to sey that a like amount of bullion has nsver besn sxtracted from any portion of the Nevada mines with so large a margin for profits. Ths total yisld of the Ely District, up to this time, amounts to a littls over $8,000,000—nsarly all of it extracted during ths past two years.

Troubles at the Outset.

At ths bsginning, some blundere leading to discomfiture and loss, were made hers as slsewhers. First, was ths mistake of attempting to smelt ths ores, whereby the Meedow Vallsy Company sunk some $60,000 bsfore discovering their error, or rather that only the upper stratum of their ores, to ths depth of 175 feet, was not adaptsd to reduction by this method. Ths Raymond & Ely proceeding on ths other band to mill their top orss, lost more than half ths silvsr they contained, owing to the pressnes of so much lead; 15,000 tons of this class, worked for them undsr contract with the owners of ths Mee Mill, having yielded up 43 per cent. of tbe silver it was known to carry.

Then, ths pioneers hsrs had to contend against the troubles arising from an entire waut of water in ths vicinity of the mines—from excessively high freights, owiug to ths long distancs suppliss hed to he hauled on wagons, and, against the so-callsd "Soldiers' titles," a description of claim, not, perhaps, very firmly grounded in justice, but which, having obtained judicial recognition, might bs, and in soms instancss was, used to harass the owners of good propertiee. Of that species of lawlessness, common in frontier communitiee, they had, of course, the usual amount to contend with.

The first of these difficultiee has been overcome through the construction of tbe Pioche Water Works, bringing water through wood and iron pipes from Big Cañon Springs, situate uine milee distant in the mountains. The supply for the present is ample, and furnished to the inhabitants of tbe town and to the mines and hoisting worke, where needed, at reasonable prices. Freights are still maintained at high figures, while the evils caused by conflicting titles and disorderly conduct are gradually diminishing.

Bogus Claims and Blackmail Operations.

The location of worthlees claims for the market, and frequent attempts at extortion under tbe pretence of adverse title must always be expected in a district like this; and when Commissioner Raymond, during his late visit to Pioche, steted that these casee were numerous here, he paid the minee a merited compliment while annonncing a well recognized fact. To the inexperiencsd the remark of ths Commissioner might eeem ungracions; but not such is the construction put upon it by the eagacious minsr. Bogus claime and black-mailing operations are not common where ths miues ars poor; hencs, to his mind, an absnes of thsse arguss a poverty of mineral wealth, and he will hs the last to resent a charge of this kind, preferred against the district in which hs is interssted. And yet these disreputable cases are not speciaily numsrous here, there haviug been but comparatively few attempts at downright fraud, while judicial procesdings have been almost wholly epared thoss infamies that disgraced alike the courte, ths bar, and litigants themssives, in the early days about Virginia. The suit of the Kentncky against the Raymond & Ely is generally looked upon here as an unjust procseding, and Mr. Raymond undoubtedly had tbat cass more especially in viswwhsn commenting on thie particular phase of affairs in Pioche.

The First Prospecting in these Parts

Was done by the soldiers stationed at Rush Valley near Great Salt Lake, in 1864, and although thssè men organized districts and made soms locatione, thsy performed but littls work upon thsm, being unable to remain, as is falleged, on acconnt of the hostility of the Indians. The Mormons wbo, about 1853, settled at Panaca, in Dry Valley, about ten milss from hsrc, had besn in the habit of working these miues, extracting and smelting ths surface orss for the lead they contained. Their object being to obtain metal for bullets, they made uo effort at ssparating the silver from ths lead, though it would look as if thsy wers awars of its presence, Panaca, the name of their sattlement, being said to signify silvsr in the Indian tongue. Thsss psople also had several small settlemeuts sxtenliug into Steptos vallsy, 140 miles north of this place; hut ths inhabitants, upon the boundary between Utah and Nevada being established, abandoned thsir homes and moved over the line on finding they were thrown into this State. Thosè of Panaca and places farther south, however, rsmained where thsy wers submitting to Gentils rule rather than give np thsir homss. Owning teams and cultivating the land, they constituts here a useful elsment, supplying the mining community with farm produce of various kinds and doing a greater part of the bauling. Beiug thns enabled to maks mouey out of their ungodly neighbors, tbsse saints have ceased to regard, as aforstims, the Gentils presencs as an umitigatsd evil.

Making Haste Slowly and Keeping Down Expenses.

Although not much work or even thorough prospecting was done in this vincinity until 1869, no district in Nevada has ever made such rapid and at ths same tims healthy progress as this. Others have built up towns more speedily and caused a greater amount of excitement, hut nowbere else have snch solid and judicious improvsmsnts bsen mads in so short a time as here, the growth of the principal towns and the srectiou of mills having kept even pace with work on the mines, and not as in many otbsr districts hsen grsatly in advance of ore developments.

Besides this steady and wholssome growth, and a compartive freedom from litigation and excitement, the proceeds of the orss sxtracted from ths minss here in the course of prospecting operations, have gone far towards defraying the cost of their plant and dsvelopment, the owners gensrally having been assessed vsry lightly, and in some cases not at all, to mest thsee expensee.

Mills and Hoisting Works.

Thsrs are now here nins mills, all nearly new, well-built aud appointed, and running on ths ores of the district. They ars located at or near Bullionville, in Dry Valley, twslvs milss distant, a little south of eaet from Piochs, tbis being the nsarest available point having a sufficient natural supply of water for milling purposee. These establishments consist of the Pioneer, five stamps, belonging to the Raymoud & Ely Company, and built in 1869. It has lately besn overhauled and put in a more efficient condition; the Meadow Valley, thirty stamps; two others belonging to the Raymond & Ely Company—ons of twenty and the otber of thirty stamps; ths Bowery and the Excelsior, each ten stamps, and the Ameican Flag and the Condor, each 15 stampe. Thsre are also hsre ssveral Stetsfeldt furnaces and smelting works. Ths value of the base bullion extracted duriug the current year is eetimated at about $130,000. The erection of several additional mills has been provided for, the machinery of some being on the way, the constructiou of still others at an early day being contemplated. It is the opinion of many here, that if the mines already opened continue to improve as tbey have done of late, and others develop according to expectation, that the present number of stamps will be doubled within the next eighteen or twenty months. About twenty steam-hoisting works have been erected on the mines in this neighborhood, and almost every week the machinery for others arrives on the ground. Tbese vary from 15 to 35-horse power, and like the mills, are mostly new and modeled after approved patterns.

The Vein System—Ores, Etc.

The main mineral belt, carrying the system of veins here, runs uearly southeast and northwest, it is abont two miles wide and 10 or 12 long, the town of Pioche being situated near the middle. Within this area the bnlk of the more extensively developed mines are located, although many claims have been taken up and some work done outside of it. Ths veins thsmselves mostly cut this belt diagonally, running nearly east and west, though some trend towards other points of the compaes. The vein matter is chiefly quartz, and the conntry rock quartzite. The lodes, though generally regular and well-walled, ars not massivs, varying from two or three to eight or ten, and, occasionally, 15 and 20 feet in thickness. They pitch mostly to ths south, at angles ranging from 45 to 80 dsgrees—the averags being about 60. As a general thing, they carry more or less ore from the surface, a good deal of lead being mixed with it to a depth of 150 or 175 feet, after which the ores bccome frser, and can be worked tolerably closs without roasting. Ths most of ths ore in the district is of good average and much of it of very high grade, turning out under the stamps from $100 to $200 per ton.

Towns, Population, Local Industries, Etc.

Pioche, is ths largest town in Eastern Nevada, and in point of population, ths fourth in ths State, and lies central to the priucipal mines here. It contains about 3,000 inhabitants, exclusive of the miuers ontsids its limits. The placs is named after the lats F. L. A. Pioche, of San Francisco, who helped to fit out ths first explorers, and was largely interested in the early locations made here. This term is often applied to ths district itself, the proper nams of wbich is the Ely, it having been called after John Ely, a pioneer in these parts, and ons of the owners of the Reymond & Ely miue. Ths town is well built up, contaiuing a uumbsr of largs fire-proof stores and other substantial buildings. It has a thrifty trade, is growiug steadily, and has a promising future befors it.

Bullionvills has about 500 inhabitants in aud around it. Its position as tbs great milling csnter of the district renders the origin of its name snfficiently obvious. It is also a prosperous town, and beiug the terminus of the narrow-gauge railroad now being built to counect it with ths mines, must soon grow into a place of importance. Panaca, lying one mile southeast of Bullionvills, is a hamlet of abont 300 inhabitants, nearly all of whom are eugaged in farming and kindred pusnits. There is a tract of fine arabls land about their settlement, much of which is devoted to raising vegetables and grain. These psopls also keep a good deal of stock, and snpply ths minsrs with fresh beef, butter, chesss and milk, which they gensrally furnish at fair prices. They are quiet, industrious aud frugal, and being so far removsd from tbs authoritiss at Salt Laks, are gradually falling into the ways of the hsatheu rouud about them.

Excessive Cost of Everything Here—Need for a Narrow-Gauge Railroad.

Good miners are in demand here at $4 psr day; mill-men, blacksmiths, teamsters and wood-cboppers can also get employment at good wages. The prices of nearly everything in this regiou are bigh owing to ths general barrsnuess of ths country and the cost of transportation. Ths necessity of a new narrow-gauge railroad connecting tbis placs with Salt Lake or some point on ths Csntral Pacific is greatly felt. If San Francisco sxpects to securs the trade of this section she shonld see to it that ths latter is speedily built. A more favorable routs than cxists for a road of this kind could not hs desired. Constructed from Humboldt Wells or Toano it would run all the way through a smooth, open valley, containing a great amount of good farming and grazing lands, and skirted on either hand with mountains abounding in water, timber and infinite storss of mineral wealtb. Nowhere in the world could a route of this length be found affording snch natural facilities for constructing a road or sucb abundance of resources to sustain it whsn built. Ths country being all the way nearly level and witbout rocks, trees or other obstructions, and almost without creeks or ravines, the road bed could bs prepared expeditiously and at littls cost. A road on this line would run through or vsry closs to the Silver Zone, Sprucs Mountain, Egan Cañon, Hunter, Sebell Creek, Robinson and many othsr important mining districts, any ons of which would almost warrant its being built. When such a road had rsacbsd tbis point it might advantagsously be continued on to ths Colorado, as the whols intervening country is rieb in minerals and will havs to procurs most of its lumber from points uorth of hers.

An Important Trade in Jeopardy—San Francisco's Opportunity.

But if San Francisco is to move in this matter it should be done at once. Already the Mormons are pusbing their narrow-gauge road rapidly south from Salt Lake. In another year it will have passed a point opposite to and less than a 100 miles distant from tbis place. That a branch will he thrown out from eome eligible poiut to Pioche may be expected. Being thus placed in railroad communication with Chicago and other Eastern cities, the business of this and adjacent districts must inevitably be diverted that way. Nothing can be clearer than this; and if the people of San Franciso intend to defeat tbat result, or hope to secure even a portion of a trade that must soon grow iuto enormous proportions, they should be up and doing—there is not a moment to be lost. Here is a railroad project on which all can be united, and in which even the Central Pacific Company would, no doubt, co-operate with the citizens of the metropolis in carrying to a speedy consummation. A nerrow-gauge track from the Central Pacific to Pioche should be the next thing in order on the railroed programme of California.

Clark Mining District.

A correspondent of the *Alta* writes ae follows concerning ths mines in this district:

The fact of railways soon penetrating our dessrt wilds will necessarily attract public attention to the vast mineral wealth that has for ages laid hidden in this long neglscted and almost unknown silvsr regiou. Ths large and continuons shipments of rich silver orcs for the last two years from this district to Sau Francisco has scarcely been noticed in our leading public journals. Even the exact locality of the Clark Mining District is quite unknown to ths outside world. This district is situated on ths State line of Nevada and California, half-way between Death Valley and Fort Mohave. The nearest points are: to Steamboat Landing, on the Colorado river, forty miles; to San Bernardino, two hundred miles. There is a good road and easy stages between water—the greatest distancs not to exceed twsnty-five miles—and plenty of stations with good accommodations and at resonable rates. The district is well watered; numerous springs furnisb an abundant supply of good water for all practical purposes. Ths climate is mild, with no sxtremes of heat or cold.

Timber.

An inexhaustible supply of cedar, fir, and nut pine, covers Clerk Mountain from base to summit, around wbose base the extraordinary rich ores ars extracted.

The Principal Mines

Worked at present are the Beatrice, Nos. 1, 2 and 3, and tbs Snowstorm, owned by McFarland Bros. They smploy six to fifteen miners. Within ths last year thsy have run over ons mile of tunnel on their mines. The entire expense hae been covered by selling tbe ore extractcd, in San Francisco.

Work on ths Lizzis Bullock mins, owned hy Hight & Chalfield, is vigorously pushed. They havs a tunnsl on this extraordinary vein of rich coucentrated ore, 240 feet, without showing a siugle fault or break in the lead. The main shaft is down 125 feet, and still sinking on ore that will sell in San Francisco for the silver alone, $1,500 per ton, to say nothing about the other valuable metals it is known to contain. Ths air shaft was sunk 93 feet without breaking either foot or hanging wall. What is most extraordinary in rsgard to this mius is the dsmonstrated fact of its being a true fissure vein, cuttiug the limestons formation at right angles without a break or fault, and also that the parties who owu it, both having been poor men, laboring undsr the disadvantages of a new country, have, by their indomitable will, not only opened their mins in a thorough aud workmanlike mannsr, hut actually realized a small fortune wbils doiug it.

About 100 tons of assorted ors has been shipped from this district, varying from $400 to $2,000 per ton, besidee abont 1,000 tons of milling ore on tbe dumps that will average $200 per ton in silvsr. Following ars a fsw extracts from returns of ore shipped by Hight & Chalfield and assayed by J., A. Mars: 30 sacks, $1,995 per ton; 24 sacks, $1,744.11, and 90 sacks, $1,127.54 per ton, marked (IxC).

Copper Ores

Are in great abundance. Tbs "Copper World" mine belonging to the Piute Company—perhaps the largest dsposit of copper in the world—assays from 60 to 85 per csnt. in copper; also nativs silver can be plainly seen with ths naked eys.

Rich Galena Ores

In large and well defined leads intsrlacs the whole district. Ths Umbahcet, Joeephus, Mohawk and Arizona owned by the Piute Company, ere large and promising mines, but for some reason ths Company has shown no disposition to develop them. The deepest shaft on any one of their minss will not excsed 30 feet. This Company operated in this district eight months.

Ths New Act Mins, owned by McCullongh & McIntyre, is a three-foot ledge on tbs surface. Ore smelted in a gaso of their own construction, yicldcd bullion worth $2,500 per ton.

Rich Lead Ores

In Cogoweep cañon. The principal mines are owned by Hight & Chalfield. Specimens taken from ths Chrysopolis and Sparkling Gem mines assay from $150 to $1,265 per ton in silver, aud 80 per cent. lead. Ths ors is very tractable and smelts readily in an open camp fire, tbe metal ssparating freely from the elag by this primitivs process. Thess energetic miners have establisbed a camp of twelvs or fiftesn men, and are now rapidly developing these rich mines.

In the early history of the district it was currently reported by interested parties that tbe rich ores were refractory. Subsequent working of the ore by the rudest process proves this to be utterly false. As proof of the tractability of tbe very richest ore, here is a circumstance: Mr. Holt was shot in the leg hy a renegade from Arizona; there wae no physician or surgical instrnments in the district, and to save the man's life the wound must be probed. Thomas McFarland, an ingenious miner, concluded he could make the desired instrument; he took some ore from one of his mines, smelted it in a blacksmith's forge, molded it into a bar and beat it into shape witb a wooden hammer, and probed the wound, all in the same day. The probe is eight and a half inches long, nice knob at the small end, and bends with the lightest touch. Now tbe question may be reasonably asked, How is it that there has been no reduction worke put up in the district? You have all the natural facilities for running such works, and the highest grade ores on the Pacific Coast.

Business Cards.

H. C. BENNETT,
STATISTICIAN.
Reports and estimates made about all departments of Production, Commerce, and Manufacture, of the Pacific Coast. 5v24-tf

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Opsrates as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

S. W. HOWLAND & CO.,
Crushers and Samplers of Ores,
No. 16 DRUMM STREET,
BETWEEN CALIFORNIA AND SACRAMENTO STREETS.
S. W. HOWLAND, the Pioneer Crusher and SAMPLER of Ores and Pulverizer of Mineral and Chemical substances, has returned to San Francisco and resumed business at the above, his original stand. He wishes it to be DISTINCTLY UNDERSTOOD that having several months ago dissolved partnership with Mr. Thurman at the Mission Street Mill, he has now NO CONNECTION WITH THAT ESTABLISHMENT whatever.
The Same Faithful Sampling
Formerly performed by him may be relied on, and such is guaranteed. oc1915p3m

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE
Caution Against Fraud.
The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

The Diamond Fields.

The "Arizona diamond fields," according to late accounts, are not in Arizona at all, hut in Colorado. Still it is satisfactory to know that they are located eomewhere, and even if deluded individuale have gone hastily to the former Territory it is not far for them to travel to get into Colorado after all. The definite location, ae now underetood, was pointed out by Ex-Governor William Gilpin, of Colorado, who has delivered an addrese on the "diamond fields of Colorado and New Mexico," which is reported in the Denver (Col.) *News* and Denver *Tribune*. The Governor maintains the existence of an itacolumite, or precious stono formatiou, along the entire Rocky Mountain range, as distiuct and palpahle as the veins and lodes of thc precious metals, or the rocks themselves. The country is described as magnificent in scenery and wonderful in climate and probable mineral productiveness. The Governor stated that the existence of diamonds and other precious stones in the Rocky Mountains, was coufirmed alike hy recent discoveries and old traditions, and spoke of the correspondence existing between this portion of the country aud the "Esmcralda Moutains," and salt regions of Bolivia and Colombia in South America, and of the diamoud regions of Brazil and Hindoetan.

The *News* thinke that prohably no one is more competent to speak on this subject than the gentleman referred to, from the fact of his ecientific knowledge and his personal examinatiou of the country where the precious etones exist. He traced out on maps the location of the diamond fields, and located them in the San Juan Country, near Poncho Pass, in Colorado Territory, saying that hefore long that section of country would develop more diamonds than any other in the kuown world. The southern portion of the Territory, near the New Mexican line he considered prolific in the most precious of minerals, and the largeet and purest of diamonds; the climate is warm and there is a euperahundance of water for mining operations. This geutleman has been at the fielde and the local papers give credence to all his etatemeuts without hesitation. The description of the country is highly colored aud conveys the idea of a new El Dorado.

The *Tribune* meutione that in the report of Major Powell, commanding a Government exploring expedition of the Colorado River, from where the Union Pacific crossee it to the mouth of the Grand Cañon, it is etated that the formation through which the Colorado cuts its way is eandstone of varied colore, similar to the itacolumite of the New Mexico and Brazilian diamond region. This itacolumite formation is mentioned ae runniug lengthwiee through the valley of the Colorado while it strikes the eouthern boundary of Wyoming. This valley is houuded on the west hy the Wahsatch range of mountains, and on the east hy the Rocky Mountain range, and gradually narrowe down to a point at the head of Green River, (the upper branch of the Colorado) on the eaetern border of Idaho, near the forty-fourth parrallel of latitude. The distance indicated by the surveys is about 1,000 miles, hut the character of the productions of the formation is a matter which future explanatione and surveye are necessary to solve.

There are so mauy conflicting statements as to the locatiou of the fields aud the value of the stones found, that the excitement in regard to them has suhsided in a measure. Nevertheless it ie generally thought that a large nnmher of men will go in the direction indicated, hy next epring. No douht that diamond fields have really heen discovered some where in the Territories spoken of, and ae geológical features are not of conrse restricted by arbitrary houndary lines, the fields may lie partly in Colorado, Utah, New Mexico and Arizona, or near the corner where they join. Without doubting the statements of Goveruor Gilpin as to the richnese aud situatiou of the fields, the statemente of partiee well kuowu in this city, would have more weight with our community than any made by peoplo living iu the Territory which will be most benefitted hy the discovery, and consequent increase in population.

The people at the African diamond fields have caught the "Arizona fever," and some of them propose bettering their fortunes by changing their diggings. Some fifty or eixty diamonds have been received here this week hy G. A. Treadwell, Secretary of the Origiual Diamond Discovery and Mining Company, which are pronounced to he genuine geme by prominent jewellers in thie city. The locality from which they came ie a eecret. A real (?) diamond field ie eaid to have beenfound near Hot Creek, British Columbia. A man named B. F. Woodward has arrived in Denver from Arizona with a package of "stones," and of them the Denver *News* eays:

"The collection is said to have heen gathered iu Arizona. It could have been gathered as well in almost any of the Territories. The gernets were of euch an order as can be purchased in the London market for a cent aud a half apiece. Not a single epecimen in the whole collection is entitled to he rated as a stone of any commercial value."

As indicating the nncertainty attending thie matter a diepatch dated Salt Lake, Nov. 11th, states that a party of prospectors have returned with eamplee of precioue etones, including what experts positively pronounce diamonds. Theee were said to have heen found southeast from the Uintah Reservation in Utah. Another dispatch from same place, eame date, saye that a party arriviug there say the fielde are 150 miles from Cheycnne, and that they found Janin's locations and brought back copiee of notiicee. As will be eeen from what we have given, the location of the fields is etill uucertain to the public, though indications point to Colorado. We will endeavor to get what reliable information on the suhject we can for our readere, but hesitate to puhlish the current rumors, many of them without foundation, as they are calculated to mislead many interested in the question.

California State Fair.

Gold Medals Awards.

The committee met, as per adjournmeut, at the Secretary'e office on Saturday and proceeded to read and discuss the claims filed hy the different applicante for the gold medale. The committee had carefully examined all the exhibitions during the fair, but adjourned to give all an opportnnity the more fully to explain the especial merits of each, by filing written statements. Many of these were very interesting and instrnctive, and eviuced a considerable skill in the writers. The medal in the firet department had already beeu awarded to Col. C. Youuger, of San José, for his breed of Short-horn Durhams, so that thie committee commenced with the second department, embracing machinery.

The committee found many articles of great merit, hut the contest was soon narrowed down to the Goodwin pnmp, exhihited hy the inventors, Goodwin & West, and a new turbine wheel, invented and exhihited hy Dr. James Cummings, of Amador county. The medal was finally won hy the former by a ballot of one majority.

In the third department the contest was also quite spirited, and on the first hallot each member of the committee voted for different exhibitione, the hallot etanding one for the exhibition of wax flowers, wax fruit and other wax representations, exhihited by Mrs. Anna Gettz Lucas, of San Francisco; one for millinery—and especially for home-manufactured wire honnet aud other frames, made and exhihited hy Mre. W. C. Barrett, of Sacramento; aud one for the Jute Manufactnring Company, of Oakland. Had the latter filed a etatement euch as they might have done, it is quite prohable they would have been the snccessinl parties, hut the medal wae awarded to Mrs. Lucas hy a unanimous vote.

The fourth department brought ont more applicants than any other, and many exhibitions eeemed very nearly equally meritorius; three, however, were developed to be the favorites of the committee; beet sugar, by the Sacramento Valley Beet Sugar Company, the home mauufactured glaes, of various kinds, exhibited hy the San Francisco Glass Company, or the manager, Carltou Newman; and artificial stone, manufactured by an Eastern company, hut represented here by George W. Morgan, of Sacramento, and who is contemplating the eetahlishment of a factory for its manufacture in this State. The medal was finally awarded to the Glass Company, and the Artificial Stone Compauy, and the Beet Sugar Company were each recommended to the Board for a special medal.

The fifth department had not so many applicants, but here aleo there were three that seemed to the committee pretty evenly divided as to merit. Theee were James T. Stratton, of Alameda, for artificial forests of Australian gum trees; Wm. M. Haynie, of Sacramento, for hops, and Rohert Williameon, of Sacramento, for a very full variety of very superior vegetablee. The latter proved to be the lncky man.

Iu the sixth department E. F. Aiken, of Sacramento, and L. A. Gould, of Santa Clara, were the only coutestante—the former for dried and preserved fruite, and the latter for dessicated fruits or fruits dried by heated air. Both exhibitions were very valuahle and meritorious, but there heing a douht in the minds of the committee ae to the quality of the fruit dried by the deesicated process, Aiken was awarded the medal.

The eeventh department—that of fine arts—embreced etatuary, paintings and deeigns. The artists, beiug proverbially a modest class of people, left the committee to make the decieion pretty much without comment. However, J. C. Devine & Bro., of Sacramento, gave an essay on marble and the ert of working on the same. George G. W. Morgan eet forth the merits of bis idea of a narrow gauge railroad and canal combined, as illustrated in a design exhibited by him at the fair, while Alfred Hart, of San Francisco, entertained the committee with a very interesting and well-writ ten criticism on fine arts, and especcially upon the merits of the portrait and landscapes exhibited by him, and the committee awarded him the medal.

The committee recommended the Board to offer hereafter a gold medal for the most meritorious invention made within the State during the year.—*Union.*

A Frear Stone Front in Oakland.—A three-story building, of about 60 feet frontage, faced some six inchee in thickness with Frear Stone ie heing completed opposite the Railroad depot, on 7th etreet, in our neighboring city. Its color ie light grey, and the molded blocks form a good and subetantial looking front. A considerable number of first-class huildings are now heing erected in Oakland. The city has steadily improved during all the dull times of the past three years. Still more rapid development is anticipated for the next twelve months.

Rich Discovery.—A dispatch dated Eureka, Nov. 11th, etates as follows: The old Lookout ground, owned by the Eureka Conealidated, which has heen worked four months by the Richmond Consolidated, without the knowledge of the former, wae opened to-day by an order from the District Court and shows the largest aud richest body of ore ever opened on Ruby Hill. Great excitement prevails here among mining men.

Insure in the Connecticut Mutual Life.—The late Hon. G. W. Mowe, State Insurance Commissioner, held a life policy in the above Company for the sum of $20,000. Well versed in the etanding, management and ratee of all Companies in the United States, he chose to insure for a liberal sum in thie old Hartford Company.

Toland Medical Institute. — We acknowledge receipt of au invitation from R. Beverly Cole, M. D., to be present at the Commencement Exercises of the Toland Medical Iustitute, hut were unable to attend.

And in accordance with law, and an order of the Board of Trustees, made on the third day of October, 1872, so many sharea of each parcel of aaid stock as may be necessary, will be sold at public auction, at No. 327 Montgomery street, San Francisco, Cal., on the 25th day of November, 1872, at the hour of 10 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenaes of sale.

DAVID WILDER, Secretary.

Office, 28 Merchants' Exchange, California street, San Francisco, Cal. no9-3t

Excelsior Silver Mining Company—Location

of works, Yellow Pine District, Lincoln County, Nevada.

At a meeting of the Trustees of the above named company, held October 29th, 1872, at the office, No. 640 Washington street, San Francisco, it was, on motion, ordered that the following resolution, which was unanimously passed at a meeting of the Stockholders, held October 28th, 1872, be advertised for one month in the Mining and Scientific Press, and a personal notice served on each member:

Resolved—That we, the Stockholders representing in our individual names 4,480 shares of the Excelsior Silver Mining Company, do hereby mutually agree to return our individual certificate or certificates of stock now held by us and standing in our names, agreeing that upon a pro rata division of the entire stock between the stockholders, that we will individually pay a monthly assessment of ten dollars ($10) per month for one year, unless sooner rescinded by the Trustees of said mine.

Also, that said monthly assessment shall be paid on or before the tenth day of each month, commencing November 10th, 1872. By order of Trustees.

no2-1m W. A. KOLLMYER, Secretary.

Golden Rule Mining Company—Location

of works: Chili Hill, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1872, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at the office of the Company 432 Montgomery street, (Room No. 5) San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the third day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fourth day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. B RUSSELL, Secretary.

Office, Room No. 5, 432 Montgomery street, San Francisco, Cal.

Hudson Gold Mining Company—Location

of works, Cherokee Mining District, Plumaa County, State of California.

Notice is hereby given that at a meeting of the Trustees of aaid Company, held on the 11th day of November, 1872, an assessment of 7½ cents per share was levied upon the capital stock of aaid Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 411 California atreet, San Francisco, California. Any atock upon which aaid aasessment aball remain unpaid on Monday, the 16th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 6th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expensea of the sale.

JCS. L. KING, Secretary.

Office, 411 California street, San Francisco, California. no16-4t

Indus Gold and Silver Mining Company—

Location of works, Virginia City, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1872, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at No. 24 Merchants' Exchange, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,

DAVID WILDER, Secretary.

Office, 24 Merchants' Exchange, California street, San Francisco, Cal oc26-4t

Kincaid Flat Mining Company—Location

of works, Tnolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of Oc ober, 1872, an assessment of three dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, No 220 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain un-

paid on the 21st day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. H. CORNELL, Secretary.
Office - No. 220 Clay street, San Francisco, Cal. ow18-4t

Lady Franklin Gold and Silver Mining

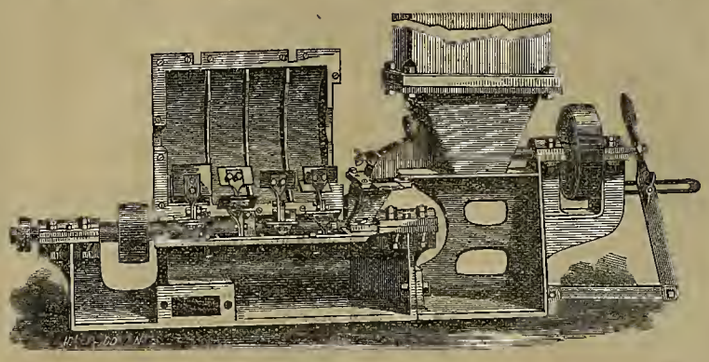
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have heen running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with hut little power required to drive it, and hut slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for miningor other operations. Respectfully' J. W. JONES, Superintendent, etc.

May he seen in practical operation on Main street, hetween Howard and Folsom, San Francisco.

This Machinery has heen adopted hy nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this hefore purchasing elsewhere.

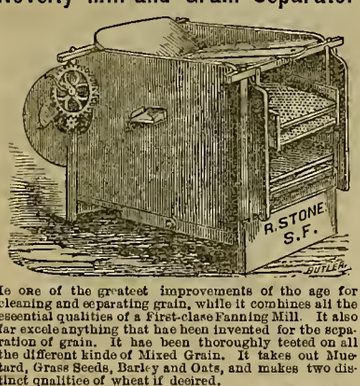
THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

CALDWELL'S

Improved Stop Governor,

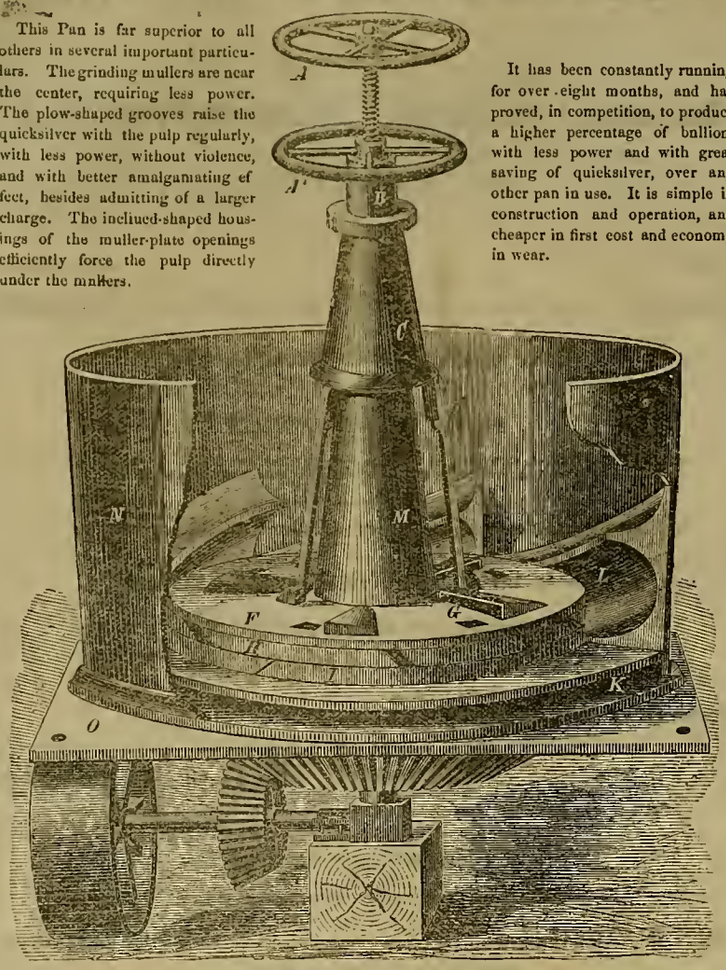
Manufactured at the CYCLOPS MACHINE WORKS, 113 and 115 Beale street, San Francisco.

3v24-3m WM. CALDWELL.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.



Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

Machinery and Castings of all kinds.

JESSE A. PIERCE, agent and correspondent of the MINING AND SCIENTIFIC PRESS and the RURAL PRESS, published by DEWEY & Co., San Francisco, called on us this week in the course of his rambles through this part of the country. He has been making a pretty full inspection of our mining and agricultural interests. We shall probably see his opinions in the above named papers.—Auburn Herald.

"From the Beginning to the End."

SANTA CLARA COLLEGE, Oct. 30, 1872.—Messrs. DEWEY & Co.—Gentlemen:—The letters patent for my invention, "The Rein-holder," have just come to hand, and I beg to thank you for your gentlemanly and business-like method of dealing from the beginning to the end; and whether I am successful or not, with regard to the sale of my design, I shall surely recommend you to all I come in contact with, if they need letters patent obtained, or otherwise. Yours very truly, E. O. E. VILE.

"I Would Not Be Without It."

MESSRS. DEWEY & Co.:—I prize your paper very highly, as it is the best of its kind I ever saw, and I would not be without it. Yours truly, J. P. V.
Modesto, Cal., Oct. 26, 1872.

☞ SEND BY LETTER, AND GIVE YOUR NAME AND P. O. ADDRESS, when you wish this paper stopped, if it is continued beyond the time paid for, as sometimes happens through request of agents or other parties. Returning the paper, or telling the P. M. you will not take it, is not sufficient notice. Parties requested to notify us, frequently fail to do so. Papers sent back are liable to miscarry. Without your address with your name we might have to look over near 10,000 names before finding yours, to cross off. We do not intend to send the paper to a single person who does not desire it, and in case of mistake, will thank any subscriber to inform us. bptf

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $6 in cloth; $6 in leather—coin.

BY OTHER AUHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for nine years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other Americau weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rivalou this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineor, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patrouize its columns of fresh and valuable information.

Every Mining Engineer, Supe intendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 23, 1872.

VOLUME XXV. Number 21.

Our Representative Arts.

About, or eoon after, New Yeare, Mr. Guido Knstel, the distinguished authority on California and Novada methods of reduction, by mill procees, eto., will take hie departure hence ae our representative at large to the great Vienna World Exposition of 1873.

This Exposition will differ from the French Expoeition of 1867, eix ycars ago, much in the samc manner as the German character differe from the French. It will represent the Industrial Arte and the Sciencee in their lateet stagee of advanccment as hearing thereupon, very methodically, if the German character cau guarantee it. The Expoeition includee in the plan, we are told, an historical view of the industries of the civilized natione from their earliest infancy, illustrated by modcls, placed in their proper order befor the eye.

Mr. Kustel desires to show the Old World the minere, mechanice and metallurgists who have been in thie bnsincss in Saxony, Bavaria and Moravia 1,000 or 1,100 years, in other placee 2,000 years, without interruption—in the continuously profitable occupation of mining—what the daring and adventurous blood of Californiane has developed in the antipodee of our race'e birthplace, and what we can contribute that may be new or good. That aseuredly is vastly better for *us* than much that ie done by those long-experienced anceetral etay-at-homes, and our coueine in the mining arts.

Mr. Kustel proposes to take with him a full set of modele of our California concentrating, milling and reduction devicee, representing to the underetanding the actual methode here practiced. While theee models are being made, in the couree of the next two or three months—provided our mining industry can afford to contribute the means for employing eeveral model makers for that length of time—Mr. Kuetel ie ready to deliver, in connection with the technological and special class lecturee of the Mechanice' Art College now heing provided for under the auspicee of the University, a course of practical demonetrations and lecturee extending over the whole ground indicated; lecturee from which eomething of practical operatione may he actually learned.

Ie there enough money or intelligence aeeociated with the mining industriee of California and Nevada, of Idaho and Utah, and Colorado, to raise a few thoueand dollara for the making of euch models? Especially, when the eame will be returned to ue and placed permanently in the University Museum, for eimilar illustrative lectures hereafter.

A meeting will shortly be held by the Chamher of Commerce, the Mechanics' Institute and the Immigration Society jointly, with repreeentativee, perhaps, of mining etocke, and other industries, when thia matter will be considered. In the meantime if there ia any living reeponee to be looked for from the quarters indicated, let it be expreesed decisively to the editor of this journal, or the President of the Mechanice' Inatitnte.

Boilers ann Boiler Making.—The extreme price of coal in England has etimulated scientific men to atudy the hest mode of iteeconomical application to manufacturing, naval, and mechanical purposes. We see that Mr. N. P. Burgh, the well-known marine engineer, ie ieauing a work on thia suhject, in which he waa aasisted by many engineers. The book ia illustrated and the London *Mining Journal* in apeaking of ita merita saya: "it hae heen received well by the ecientific and eeafaring public, hut it deeerveapopular eupport in the wideet eenee of the term.

Almond Culture.

We hava received eome fine specimene of the true Languedoc almoud, grown by Mr. B. D. T. Clough, of Washington, near Nilee Station, Alameda County.

Wc were aleo favored with a small branch from one of hie treee, full of leaves and almonde, of which we preeeut an engraving in miniature and which ie a good representation of the original, except that we could not find room for half the almonds—ae compared with the leavee—that grew upon the branch.

It wae early foreseen by the growere of the almond, that its commercial value would increase with the growth and exteneion of commercc and civilization, and the attempt to improve its quality has been thc aim of culturists for more than four centuriee. The result of theee persietent attempts at improvement, finally culminated in the "Prince'a Premium," of Languedoc, France, ae a variety unexcelled.

Mode of Culture.

Mr. C's method of culture differe bnt little from the usual routine adopted by others in

THE LANGUEDOC ALMOND.

the growing of etone fruite. The stones of the peach ae well as the almonds themselvee are planted in epring and cultivated in nnreery rowe the firet year. The almond ie grown ae we have intimated on both peach and almond etocks. Early in September the eeedlinge attain sufficient eize and are budded with the true Languedoc or other deeired variety. The following epring they are headed down to the bud, and allowed to grow one seaeon more unremoved.

They are then ready for transplanting in early fall, winter or epring as the eeaaon may prove most propitious, and if a good growth has been made, they will be from three to eeven feet high. They are then eet in orchard form in well prepared ground at thc rate of 150 trees to the acre or 16½ feet apart. The ground ie kept thoroughly cultivated, and almost any hoed crop except aquashea can he grown between the rowe at some dietance from the treea without injury.

The tree requires but little pruning or trimming for four or five yeare; but when it ceases to make a etrong lateral growth of limba, heading or cntting back to promote a new growth, will increaee the product ae well ae the eize and value of the almond.

Apparatus for Mixing Wheat with Bluestone.

We give herewith an illustration of a new and very convenient device for mixing bluetone (sulphate of copper) with wheat, preparatory to eowing. Referring to the engraving, the lower part of the device consieta of a box or hopper, made V-ehaped, with one side elongated for the purpose of more conveniently receiving a epout, which stands at a proper angle for operating a ecrew elevator.

The upper end of this epout ie closed and a shaft operated by a crank, paeing longitudinally through it, with a wide flange secured spirally around it, and extending down into the hopper as shown. A crank attached to the upper end eerves to work it eo ae to cause it to elevate whatever ie placed in the hopper. Midway hetweeu the middle and upper end a slot is made in the bottom of the spout covered with a perforated ecreen. To use the mixer thc hluestone, or sulphate of copper eolution is poured into the hopper and the wheat placed in

BEST'S BLUESTONE MIXER.

the solntion. The ehaft ie then revolved and by meane of the spiral flange stire up the wheat and elevatee it. During ite progrese up the epout the wheat partly draws off the eolution, hut in paeing over the ecreen, ae deecrihed, the water drains off through the slot, whence it may he carried back to the hopper by a conducting epout. The device is simple and inexpeneive. It hae been recently patented, through the Scientific Press Patent Aoency, hy Mr. Daniel Best, of Marysville, the well-known patentee of Best'e Separator.

Thanksgiving.

Before another number of the Press will have reached its patrons, that time honored day, hallowed hy eecred memoriee of the paet, and gushing with the pleasuree incident to the re-union of kindred and happy household, will have come and gone. We hope our readere all feel that they have canee for congratulatione among themselvee and thanksgivings to God for hia mercies and hleeeings.

It always eeeme peculiarly appropriate that our people, whose garnere are welling over with the bountiea of hia varied providence, should feel at heart, a true gratitude to the Great Giver. May the day therefore, appointed by the Preeident of the United Statea aud the Governor of California, as a day of happy feaating and thanksgiving, be everywhere observed throughout the State and Nation.

Cuatom has also made it, and our Governor hae indorsed it, ae a day of "innocent recreatione;" which we conetrue as meaning eepecially home pleasuree and rational amuaements; and whilst the aheent onee return and old friendshipe are renewed, the young made more joyoua and the old made young again, and all are made happy, and while mirth and becoming revelry are heard in all the land—may we never forget that it is eminently a day on which our charitiee ehould roll forth ae a great wave, encompaesing the poor and unfortunato, the widow and the fatherleee, till their hearts are made glad by our ahundant bounty. We wieh our patrons a joyous thankegiving.

An Improved Blow-pipe.

Of all the varied implemente of the laboratory the hlow-pipe ie of the utmoet importance to the chemist, in enabling him to aecertain quickly the effects of iutense heat upon a variety of eubetancee. It is, in fact, a most important auxiliary in all casee of qualitative analyeie, and an invaluable instrument for the mining engineer, the mineralogist and the geologist. There are a number of different forme of thie instrument, eimple as it is, the variationa being principally iu the mouth-piece, point, or receptacle for the saliva. The one here shown, which ie the idea of Mr. A. T. Dozier, of Oakland, overcomee eome of the objections to those of the ordinary deecriptione. Ae it is a metter of interest to aeeayere, etc., to know of any improvement in an implement of such general use we have prepared a emall cut which ie plain enough to need no description. Thoee who have ever used blow-pipes at

all will at once eee the advantage in the manner in which the ealiva ie prevented from going to the point, and the instrnment can be inverted and the moisture poured off. A blow-pipe of thie kind will coet no more, prohahly, than those in common nee, while it ie much more conveuient.

The American Institute of Mining Engineers.

The Octoher meetings of thie association. held at Pittshurgh, Pennsylvania, appear to have heen very euccessful. The proceedinge, now in couree of puhlication in the *Engineering and Mining Journal* compriee, together with much interesting information concerning the mining and metallurgical industriee of the East, particularly those of coal, iron and eteel, a good deal about the reeources of the West. We notice, for instance, a paper by Mr. R. Neilson Clark, of Cañon City, Colorado, on the Tertiary coal hasin of that region, recently opened up by the Denver aud Rio Grande Railroad. Thie was followed hy a lively diecuesion on Weetern coals, coke, charcoal and iron oree. The Preeident, Mr. Raymond, read a paper on the eegregation of gold in the hearth of a reverberatory furnace, and Mr. A. Eilere preaentod specimens of the telluride of gold and ailver, eimilar to that which occure at the Stanielaua mine, in Calaveraa County, Cal., diacovered in coneiderable quantity thie summer in Boulder County, Colorado.

Tho membership of the Institute, ie eteadily increaeing. Thirty new memhere and aaaociatea were elected at Pitteburgh, nearly half of them, we are glad to eee, heing mining engineers and metallurgiate of the Pacific elope. We truet these gentlemen will actively maintain the credit of their eection of country and not permit Eastern iron, eteel, coal and coke to have too great a ehare in the proceedinge, but give ns their viewe on aubjecta connected with the mining and metallurgy of the precioue metala.

CORRESPONDENCE.

Tintic Mining District, Utah.

EDITORS PRESS:—Ae your correspondent has heen sojourning for the past tbree months in Tintic Mining dietrict, Utab, and time hanging beavily, somewhat, upon his hands, makes bold to give you a few items relative to a district, which is commencing to attract the attention of prominent capitalists, from London, Pittsburg, Pa., Chicago and San Francisco, who have expressed their opinion by their heavy investments.

Tiutic mining district was first laid out December 13th, 1870, embracing an area of 150 square miles, contains four small hut flourishing towns, of about 1,500 inhabitante, located at a distance of three miles from each otber, and known ae Homansville, Eureka City, Silver City and Diamond City. Each town has a Poet Office and etage connection three times a week witb all parts of the Territory.

The mineral helt lies in a range of hills just west of the Wasatch, and hetween Rush Valley on the north and San Pete Valley, with the desert on the weet.

But little genuine prospecting for the precions metals was done until July of the present year, at which time, owing to the looseness of then District mining lawe, our Gentile minere met together and framed tbe present lawe, by wbich tbis District is now governed, giving proper and legal protection to the "Honest Miner." Since wbich time our District has undergone a severe prospectiug, with gratifying resnlts. Gold, silver and copper is fouud in large deposite in most all parts of the District.

Wood and water, witb one exception, is abundant in all localitiee. Silver City, eituated on the eaet side of Tintic Valley, although surrounded with wood, is wanting in water, tbat being only procured from its sister towns, Eureka and Diamond, from whicb places it is brought and eold for three cents per gallon. Of

The Mines,

I will mention a few of the most prominent and promising onee, deferring a deecription and extended notice of tbem for my next communication. In the vicinity of Eureka, we have the Wyoming, Eureka Consolidated, Cornucopia, and a numher of very promising, but undeveloped ones. Near Silver, the Mammoth Copperopolis, (the leading mine of the District); Mammoth Crisman; Swausea; Black Dragon; Sunbeam; Chicago; North Star; Cerro Gordo; Cearesa; Diamond; Ruby; Julia; Grant; Portland and Mary Ellen tunnels.

At Diamond, I mention the Julia Lane, Rising Sun; Shower (hae a good Smelter); Jefferson; Undine; Morning Glory; Golden Treasure; Norwegian; Washington; Joe Bowers and Susan. Our

Mills,

Of which there are two in the couree of erection, belong to the Wyoming Company, and tbe Eureka Consolidated Company's will be finished and ready for work in about six weeke. There will he a mill erected hy Gen. Miller and Bros. of your city, near Diamond, tbis Fall; they having purchaeed a water privilege for the sum of $3,000. Tbe Pioche Company have broken ground near a place called Tannier's Ranch, and intend to erect a small affair, and use A. B. Paul's process for reducing the ores.

The climate of our District will admit of work heing carried on throughout the year, without any interruption whatever. In my next I will mention the workings and prospects of the most promising mines of this District.

C. F. J.

Copper Smelting.

We had the pleasnre of a call thie moruing from Dr. Trippel, a very experienced and capable metallurgist and engineer, who visite Utah to perform professional work. The Doctor is a specialist in the treatment of copper ores, and is eanguine tbat he can smelt them here at a profit, and extract hy a well-known process, all the precioue metals. He informe us that he has no douht the bituminous coal whicb ie fonnd in the Territory may be readily used, not only in emelting copper ores, but in smelting argentiferoue galena, by adopting a system, now coming into general nse in Pittshurg. If we underetand the Doctor rightly, he proposes to pulverize the coal and inject it into the furnace through tuyers, by means of a hlast. The combustiou of tbe coal ie rapid and tbe heat evolved is intense enough to emelt ordinary ores. An experiment of thie kind would not he very expensive, and might be attempted with good reeults at a small expenee. Dr. Trippel has conetructed eeveral of the beet known aud snceeesful copper emelting worke in tbe United Statee, and we hope he may find sufficient inducements here to induce bim to erect a smelter of the kind in the Territory. We believe tbat the production of copper oree from lodes already discovered wonld justify an enterprise of the kind. Sooner or later the project will he carried out, as well as the eetabliebment of zinc and lead worke, and every mineral resource of the country will he developed and made profitahle.—*Utah Mining Journal.*

Notes on the Management of Mining Companies.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

Few persons who bave given any attention to the progress of mining in this colony hut must have felt surprise, that in a country so rich in gold, holding out such great prizes to the mining adventurer, and where individual miners have been so fortunate, such disastrous results have so often followed the investment of capital by joint stock companies in this pursuit, and the poor returns obtained in proportion to the amount invested. Judging from the success attending mining speculations in countries the value of whose mineral resources are not to be compared witb those of Victoria, this sbould not be so; and the question—what can be the cause of the unsatisfactory condition of this hranch of mining—naturally presents itself for solution.

This is a matter of so mucb importance—hoth to those directly connected witb tbe mining interest and to the colony generally, as affecting the development of our mines tbrough the investment of the capital becoming daily more necessary for this purpose—that it must be well wortby of the attentive consideration of thiuking men.

The following remarks, although more or less applicable to all parts of the colony, have especial reference to tbe companies having their boards of management in Melbourne, where the evil ia certainly the greatest, and the proposed remedy most easily applied. Looking back on

The History of the Mining Companies

Which have heen broken up, and many of them branded as buhble schemes, few, if any, will he found, where a large proportiou of the expenditure would never have been incurred under a good aystem of management; and some of them abandoned prematurely, through tbe disappointment of the highly-raised expectations of the shareholders, bave already heen, or will yet be, proved valuable mines. Mining is no douht a speculative husiness, and those who enter on it must calculate on having a certain proportion of failures, which may he greater or less in number, according to the caution, experieuce and judgment of those engaged. But because chance must he an element to be taken into account in mining adventures, surely the increased risk ought to induce increased caution—not the throwing aside of tbe precautions whicb are looked on as indispensable to success in every other description of business. Yet this has been the course puraued by the majority of the companies whicb bave been abandoned with heavy loss to the unfortunate sbareholders, and hy some othera where tbe richnesa of the quartz euables them to pay large dividends, in spite of mismangement.

The hest and most careful management cannot ensure success, or make a mine pay which does not contain sufficient gold; but, by the introduction of good systems of working, it can make the minimum amount of gold pay the costa, and guard against the expenditure of more money than is absolutly necessary to prove the value of the mine. Let those who bave lost in mining adventures look into the proceedings of tbe companies they were engaged in, and say how many have either heen ruined, or have expended large sums unnecessarily, solely through mismanagement—how many thousands of pounds have heen thrown away in the erection of reducing worka hefore anything was found to reduce—or the prosecution of expensive mining operations wbere no discoveries had been made to warrant tbem. There are few parties who cannot recall numerous examples bearing out the above assertions, and many appear to tbink that this unsatisfactory state of affairs is inseparable from mining. The object of this paper is to sbow that such is not the case, and that if the same principles were applied to mining companies as are considered indepensahle to the successful prosecution of any other description of business mucb of the uncertainty and loss now attending those adventures might he avoided.

A Comparison of the Method Followed

In the forming and management of other companies with that commonly pursued in connection with mining companies may be of some use in elucidating the subject. Take the course adopted in formiug a hanking, insurance, gas, navigation, railway, or manufacturing company.

The estimates of the outlay required and tbe returns that may be expected are carefnlly prepared, the hest professional assistance available is called in to advise with tbe direotors, all tbe details of tbe work are reviewed, the plsn of operations is carefully laid down, and the services of the best men are secured to take the management, under tbe supervision of the hoard of directors. Unless these precautions were supposed to be attended to, the companies would hold a low place in puhlic estimatiou, and there would he little chances of tbe shares heing taken up. Yet tbe business in all the above cases is such as to come within tbe cognizance of mercsntile men than is the case witb mining, and therefore some of tbe precautions mentioned might he neglected with less chance of injury in the former instance than in the latter.

The mining companies of Melbourne may be divided into two classes—those formed on the gold fields (the msjority of whose sbares having hy degrees fallen into the hands of shareholdera residing in Melbourne the management bas heen removed there); and the companies formed in Melbourne, either for the purpose of opeuing new ground or developing imperfectly-worked mines, hrought to a stand through mismansgement or want of capital. In the first case, the preliminary work of opening and proving tbe mine has usually heen effected by a local hoard, and tbe results obtained in the first working have induced the cbange of proprietary, so that tbe Melbourne board has only to attend to the steady prosecution of the mining operations on tbe hest system. In the second case, the hoard bave a still more difficult task to perform—to carry out an investigation into the value and prospecta of the mine, the best plan of testing it, and to consider tbe amount tbey may have to expend for tbia purpose.

Tbe following are some of the points they would bave to take into consideration:—giving to each ita due importance only, in hringing the information obtained to bear on the question to be decided. The local peculiaritiea of the quartz veins and gold deposits of tbe district, for these differ in different localities, even when in the same geological formation, and the deductions correct in one place may only mislead in anotber: the cbaracter of the adjoining mines, including the strike and dip of the veins, the form in which the gold is deposited in them—wbetber in parallel bands, irregular branches, or evenly distributed through tbe quartz; the quantity of water to be overcome, the depth at which the veins must be opened to prove the ground, etc.: the portion of the mine already opened, if any, and the results obtained from it: tbe beat plan of further proving the grouud, so that the exploration made may come in for tbe future working of the mine in the most efficient and economical way: and last, an estimate of tbe cost, and a decision from all the information collected whetber the chances of success warranted the expenditure reqnired to make an effectual trial or not. Presuming that it does, a further portion of the work has to he undertaken.

From the data obtained by means of tbe observations mentioned ahove, the point at which the veins are most likely to bear paying gold has to he decidcd on—the way of reaching tbis point laid down; then follows the close watching and recording of every minute detail in the character of tbe ground opened, to guide the future working, and the decision as to when a sufficient extent has heen explored to allow of the erection of reducing machinery with the greatest ultimate certainty of obtaining a return. After this comes the laying out, choice, and the erection of the crushing-plant—requiring a knowledge of the differeut plans now in use for crushing qnartz and extracting the gold—tbeir effectiveness and applicahility to the various forms in wbich the gold is deposited.

Importance of Judgment in Preliminary Work.

It must be evident tbat this preliminary work requires some judgment and experience in tbose wbo direct it, and a knowledge of mining in all its branches aucb as cannot be expected to be possessed by any person wbo has studied it as a profession, wbile the necessity for proceeding in this systematio and cautious way can bardly he gainsaid. Yet how few companies do tbia, or appear to tbink it necessary. The promoters usually put forward the bright side of the picture,—much is said of the large yields which have been obtained from the mines or the claims adjoining it, wbile the unfavorable eide of the question and the difficulties to he overcome are kept in the background. Althougb tbis looking at one side only may arise more from tbe sanguine temperament of the promoters than from any deliherate intention to mislead, tbe effect ia still the same. Imbued witb similar ideas, tbe directora of the company are induced to rnsb into unwarranted expenditure,—tbe capital is laid out on expensive and irregular scbemes for opening tbe mine and erecting crnshing-plants, before it is known wbether there is really a mine to open or material for the machinery to operate on or not.

The large outlay, and the failure to realize at onee tbe golden prospects held out, too often disgusts the sharebolders, and induces tbem to ahandon the mine without sucb a tborough trial as should have heen msde before the greater part of this expenditure was incurred. Mrs. Glass's homely advice, to "first catch your hare, and then make preparations to cook it," is especially applicable to quartz mining in Victoria.

This enumeration of a part of the duties to be performed in estahlishing a mining company is necessarily imperfect (for seldom will two mines be found of exactly the same character), incomplete as it is, however, it will show tbe impossibility of a board of directors, unacquainted with practical mining, satisfactorily carrying them out hy the mining manager, wbatever may be the acquirements of these directors as men of business. In consequence tbey bave to place tbemselves in the hands of tbe resident manager, and promoters, relying entirely on tbeir skill and judgment, and how often this reliance is miaplaced can best be told hy those wbo bave heen induced to throw away the tbousands of ponnds that are yearly spent unnecessarily and recklessly.

The Mine in Full Work.

We may now consider tbis question, where the mine is in full and perhaps profitable work, mentioning tbe leading principles hy which the management ought to be guided. The directors bave to see tbat tbe plan of opening, and the system of working the mine are such as to allow of the gold-hearing material being taken out in the ahortest possible time, and at the least cost, that tbe contracts let are at fair prices, or the wages men employed do a fair amount of work. All these details have to he checked, at the same time the mining manager should not he so interfered with as to fetter his free action. The majority of our mines do not leave a large margin of profit, and witb many of them the question whether they will gain or lose depends on the good or bad system of working adopted. The mining pay hills will have to be made out in such a form as to ahow at a glance how the men are distrihuted, the cost of the work in each part of tbe mine, the state of each of the contract accounts, in short afford full information of the work done, the sums paid and the amounts still due. There is no difficulty in doing this, the Englisb form of pay bill modified to suit our requirements, taking little more labor to make out tban that ordinarily aupplied.

Anotber matter much neglected is the keeping of proper mining plans and records; these may be simple rough plans and sections, correctly laid down, hut without the elaborate finisb given by the professional draftsman, which would occupy more time than it ia worth, aa it does not add anything to ita practical value. The plans should be filled up every time the mining work is measured off, and full details of the character of the ground opened should be entered on tbe record book. Too much stress cannot he laid on the necessity for attending to this point, as the ground worked is often aoon closed up, and without it the company will be entirely dedendent upon tbe memory of the manager, when information is required as to the character of the old ground; to throw light on obscure change, such as the loss of the vein from break or fault, or for any otber purpose. It is only by the aid of plans tbat it is possible to readily calculate the amount of quartz prepared for hlocking ont, to decide when it may be advisable to open new ground, to draw reliable deductions as to the pecnliar character of the vein or gold deposit, or for the directors to understand the position of the mining works. They are in fact just as necessary to the manager of a mine as tbe plans of a house or hridge are to the architect or engineer, and the man who professes he can conduct a mine without being competent to perform this simple work, is certainly undeserving of confidence. The liability to change of managers is alone aufficient to show the benefit which may he derived from well kept records, irrespective of the help they give to memory.

[To be continued.]

THE MARE ISLAND NAVY YARD grounds consist of 900 acres, and originally cost tbe Government $83,491. There are 192 acres in the New York Navy Yard, which cost $325,000.

SCIENTIFIC PROGRESS.

Is Electricity Generated by Water Currents?

Zöllaer has ascribed the production of the electric currents of the earth to the incandescent molten massea in motion beneath the crust which generates currents in the direction of their own motion; and he has expressed the opinion that all current movements of fluids, especially when in contact with solid bodies, are to some extent accompanied with currents of electricity that have the same direction as the fluids themselves. He inserted the ends of the copper wires of a very delicate galvanometer, of Sauerwald, just within the wall of a caoutchouc tabe conveyiug a stream of water, and observed a deflection of several degrees of the galvanomster scale, thereby indicatiug the existence of an electrical current, whose direction is that of the water. Tho greater the distance between the ends of tho wires—which, by the way, need not be exposed to the force of the current, hut may be replaced by metallic plates lying against the wall of the tube—the stronger the deflection of the needle.

While recently repeatiag Zöllner's experiments, Beetz obtained similar results, but found that the currents have a much simpler origia. The needle is deflected so long as the reservoir in which the water falls is not isolated. The metal tap, the stream of water, and the reservoir, in fact, form a voltaic element (brass, water, lead) whose current it is which deflects the needle. By filling the reservoir, and dipping the free ead of the tube, also filled, into it, the current is observed though the water he shut off, nor does any change take place when the tap is open. By simply inverting the position of the tube, the direction of the current is reversed; this is observed to be the case with or without a flow of water. If the reservoir be isolated, no current is formed; this is so whether tho water bo allowed to flow or not. When tap snd reservoir are of zinc, no current is produced with or without a flow of water, and with or without isolation of the reservoir. According to Beetz's observations, then, no electricity is generated by a stream of water.

Sea-Serpents. — Regarding "sea-serpents," the following note may be interesting as explanatory of some of the descriptions which have been given from time to time of "Sea-Serpents:"—The South African Museum, Cape Town, recently received a specimen of the Ribbon fish (*Gymnoterus*) fifteen feet long without the tail. It appears that this fish is kaown to distant inland fisherman as beiag forty feet long, and from its slender shape and snake-like movement is probably the "sea-serpent" of lato years so minutely described by navigators. From its bead there is erected a plume of rose-colored spinss, aad from head to tail along its back there is a conspicuous mane-like fin. Its general color is like burnished silver. The eye is large and silvery, and the profile of the head comports well with that of tbe horse. The specimen could not be preserved, but there are two smaller specimens in the Museum.

Water Freezing Below 32° Fah.—It is generally admitted that water congeals at 0° Centigrade or 32° Fahrenheit, and that it is only in perfectly tranquil places that it can be kept liquid even at a certain number of degrees below the freezing point. *Les Mondes* mentions in this connection a curious fact, which it considers due to a supersaturation, so to speak, of the water. If in water, at a temperature of —3° C. (about 27° Fah.), which may even be slightly agitated without congealing, the least particle of hoar frost or ice be introduced, crystals of ice instantly form and expand through the mass, producing remarkable and beautiful effects. Tho eye can watch the formation of the needloe of ice, ece them group together and obey thoae myeteious affinitiee which produce the exquisite forms with which we are all familiar.

Water not an Electrolyte.—The hooke have long taught that the object of adding an acid, in the electrolyeis of water, is to render it a conductor. The fact that compound substances when decomposable conduct only by electrolysie, and hence, that a body not an electrolyte cannot be made eo by the addition of another body, hae long rendered it probablo that it ie the acid which ie actually decompoeed by the current, and that the water suffers decomposition only by a eecondary action. Bourgoin has investigated the subject experimentally, and has proved that water is not iteelf an electrolyte.

Transparency of Mountain Air.—Astronomical observations ehould be made from high elevations. Prof. Young reports the whole number of lines in the chromoephere of the sun, seen from Sherman, a lofty station on the Rocky Mountains, as 150, which is three times as great a number ae have been observed from near the eea level. In these localities the atmosphere is clearer, eteadier, and it is owing to this fact that a etar has been recognized at these altitudes as having a companion or being a double star, not previously known as such.

Formation of Sandstone.

We find in the *Revue Scientifique* a paper presented to the Geological Institute at Vienna by M. Fuchs, on tho manner in which sandstone must have been formed. It is well known that what tho French call *gres*, and we "grit," is a rock composed of siliceous grsins agglomcrated into a mass, possessing more or less teaacity. Now the cement which binds them together is not always of the same kind. The question examined by M. Fuchs is, whether the consolidation of the agglutinated mass was effected immediately, or whether it was the work of time? To justify this iuqniry he quotes two cases. On tho natural jetty which encircles the port of Messina on the side of the straits there are large slabs of sandstone, with their edge rounded off, and having diameters varyiug between twelve and eighteen feet, with a thickness of ten or twelve inches. They aro buried under sand audshingle, and are unconnected with each other.

Thus also recent excavations on the shore adjoining tho sume port, have brought to light, after a depth of 9 feet of pebble and sand and a bed of gray mari, a solid conglomcrate filled with sea shells of tho same kind as those still living in the surrounding waters. Their state of perfect preservation shows that they mnst have been immediately imbedded in a soft sandy mud; otherwise they would have been exposed to destruction. The rapid solidification of the sand M. Fuchs attributes to the incrusting agency of certain algæ. The *Codium bursa*, the *Palmophyllum flabillatum*, and others are known to agglntinate shells and pebbles so as to form masses of the size of a man's fist; whence there is reason to conclude they may make larger agglomerations, such as those on the coast of Messina. The other example adduced by M. Fuchs is a sandstone with crystalline grain, ia plentiful at Siervring, near Vienna. Here the agglutiuatiou has been slow, and is owing to the infiltration of water charged with carbonate of lime. Evideutly the solidification of snch a mass required a long time, and sandstone may therefore be considered as belonging to different formations.

Action of Magnetism on Molten Steel.—Two cylindrical molds, exactly similar were filled with cast steel. Oue of these molds was surrounded by a Ruhmkorf coil, through which was passed a current from a 12 element Bunsen battery, during the whole time that the metal was cooling. The other casting was allowed to cool gradually in the ordinary manner. At the end of ten hours the molds were broken; the two steel cylindere were removed, and were broken into several pieces, iu order that their structures might be examined. It was found that the grain of the metal presented different appearances in the two cylinders. In that one submitted to magnetic action during the time of cooling down—a period when the molecules could most easily arrange themselves—the grain was visibly finer. This experiment, repeated threo times, resulted in precisely similar effects. M. Chedeville afterward made some comparative experiments on the resisting power to extension and compression, and found that the magnetized steel offered less resistance in every case than the other.

Germination of Seens.--Late experiments appear to establish the fact that while exclusion from the luminous rays of the solar spectrum is necessary to the healthy germination of seeds, yet the chemical or actinic rays are indispensable to that process. These penetrate deeper into the soil than do the luminous rays. The exclusion of the chemical rays and not the abaence of oxygen alone is assuaed to be the cause of seeds failing to grow when buried too deeply in the earth.—*Prof. Joy.*

Heat from Impact of Bullets.—According to J. Bollynski, who criticizes Hagenbach's experiments on this subject, the motion of the leaden bullet, if all converted into heat, would be three timee the amount sufficient to melt the amount of lead found to be melted by actual experiment, which he explains, as having been actually expended in denting the iron plates used. By using a hard stone target, he was able to melt all the lead hy firing the bullets against it.

A Liberal Scientist.—Mr. J. B. Laws, the eminent agricultural experimentist, of England, has, with most princely munificence not only donated his laboratory to the public, bnt has also accompanied the donation by the further large gift in cost of $500,000. The example is a noble one, and bestowed in a direction where it was much needed—in furthering the great interest of experimental agricultnre.

Cadium, Tin and Lead.—A remarkable coincidence, between cadium, tin and lead, hae been noticed by Dr. Schenk, in that the same total quantity of chloric is required to bring an equivolent of either body from a temperature of —273° C., which is assumed as that of absolute absence of heat, to a state of fueion.

Violet Light on Vegetation.—M. Baudrimont obtaine results the reverse of M. Poey, and affirms that all the oolore without exception are unfavorable to vegetation, and none more eo than violet. All plants lighted by it died first; after violet tbe most unfavorable wae green. Blue, optically situated between them did not give so fatal results.—*Les Mondes.*

Antiseptic Properties and Physiological Action of Silicate of Soda (Water Glass).—MM. Rabuteau and Papillon have called the atteation of the French Academy to the influence of the silicate of soda on alcoholic fermentation, that of urine, milk, and the action which gives rise to the essence of bitter almonds. Silicate of soda, like borax, in a certain quaatity hinders all manifestation of the agents which produce putrefaction; while, heing much more energetic than borax, a smaller amount ie required to produce the desired effect. On the superior animals, the silicate exercises a poisonous action much more pronouaced than that of borax. Two grammes of borax will not kill a dog; one gramme of silicate carries sure death The substance, in brief, from its nature is of peculiar value in suppressing the development, of the infectious or virulent germs to which a large number of diseases may he traced.

The use of red light iu photography has been found to hasten impressions and increase their sharpness. A diaphragm of thin translucent reddened paper in place of the ordinary metallic diaphragm in the camera has been tried with great success.

Tunosten in Steel.—Professor Herren bas found 8 3 per cent. tuagsten and 1·73 manganese in Mushet's steel. This steel becomes soft when heated and suddenly cooled, and hard when cooled slowly, just the reverse of ordinary steel.

Animal Fats.—Mene has stated to the *Academy of Sciences* that at different ages of life, the same animal species have fats dissimilar in melting and solidifyiug points, and in density. Also that the meltiag and solidifying points rise with age, and the density of the fat increases.

MECHANICAL PROGRESS.

Experiment in the Structure of Iron.

In some recent experiments made in France, intoresting information has been made known in regard to crystalline structure in wrought iron. The apparatns consisted in a bent axle, whicb was firmly fixed up to the elbow in timber, and which was subjected to torsion or twist, hy means of a cog whsel connected at the end of the horizontal part. At each turn the angle of torsion was 24°, and a shock was produced each time that the bar left one tooth to be raised hy the next. Seven axles were submitted to the trial. In the first the movement lasted one hour, 10,800 revolutions and 32,400 shocks being produced; the axle, 2 6-10 inches diameter, was taken from the machine and broken by a hydraulic press; but no change in its texture occurred. In the second a new axle haviag heen tried fonr hours sustained 129,000 torsions, and was afterward broken by means of a hydraulic press; no alteration was preceptible to the naked eye, bnt, tried by a microscope, the fibers appeared without adhesion, like a bundle of needles. A third axle was subjected during 12 hours to 338,000 torsions, and broken in two; a change in its texture and an increased size in the grain of the iron were observed by the naked eye. In the fourth also, the axle was broken in many places affer 110 hours and 2,553,000 torsions. In the fifth, an axle submitted to 23,328,000 torsions, during 720 hours, was completely changed in its texture. In the sixth, after ten months, during which the axle was submitted to 78,735,000 torsions and shocks, fracture produced by a hydraulic press showed clearly an absolute transformation, the surface of the rupture being scaly like pewter. The seventh axle, submitted to 127,304,900 torsions, presented a surface of rupture like that of the sixth, the crystals wore found to be perfectly well-defined, the iron having lost every appearance of wrought iron.

Improvements in the Arts of Metallurgy.—It is well known that the difficulty of uniting iron to brass is created by the unequal rate of expansion in the two metals, which destroys the uaity whon the temperature ie changed. To meet this difficulty, an alloy has been invented, by an Englieh artiean, the expansion of which, by heat, is claimed to be so similar to that of iron and steel, that the surface may he regarded, when joined, as permanently united for all practical purposee. It consiste of three parte tin, thirty-nine and a half parts copper, seven and a half parts zinc.

The construction of bronzee hae lately been much improved by the addition of a small amount of phosphorous. A special cause of the inferiority in bronze consiste in the constant presence of traces of tin in the state of an oxide, which acts mechanically by separating the moleculee of tbe composition, thus interposing a substance which in iteelf has no tenacity. Now, the addition of phoephorons is found to redace this oxide, and renders the bronze much more perfect—improving its color, its tenacity, and its physical properties. Thue treated, the grain of the bronze when fractured resemblee more that of steel, its elasticity is much augmented, and ite resistance to pressure sometimes more than doubled.

New Material for Brick.—The shale which constitutes so large a portion of the refnse of coal mines has been found in England to furnish a good material for brick. Those made from it are hard and durable, and for ordinary building are found to be quite equal to ordinary red brick.

Steel Boilers in England.—It is said that Mr. Webb, of the Crewe works, England, is adopting steel exclusively for the construction of boiler shells, the rivets being also of steel, and he stated that he hopes ultimately to be able to employ the same material for fire-boxes and tubes, to the exclusion of copper and brass. The boiler plates used are all made on the works, and a sample is cut from every plate and tested. The plates are required to have a breaking strength of thirty-four tons per square inch, with an elongation of twenty-five per cent., and a five-eighth inch hole punched in the sample strip, about two and one-half inches wide, has to stnad being drifted ont two iaches in diameter without the plate cracking. The present practice at Crewe affords ample evidence that, by proper care, it is possible to produce a material which, for boiler making purposes, is vastly superior to the very best wroaght iron obtainable.

Compressed Steel.—The extraordinary powers of resistance of the steel, compressed by hydraulic pressure, of which the new Whitworth gun is composed has been proved by one of the experiments made at the recent trial of the weapon. A cylinder representing the chamber of a nine-pounder gun was loaded with one and a half pounds of powder, and being screwed up at the shotted end, was fired through a touch-hole only one-tenth of an inch in diameter. The cylinder did not burst hut the whole charge hissed through the touch-hole leaving the chamber nninjnred. This hydraulically compressed steel furnishes a metal of the greatest value, since, by nsing it, guns can be constructed which will combine a lightness and power hitherto unattainable.

Wolfram Steel is becoming an important article of iron manufacture. It is quite largely produced at several large establishments in England and Germany, and is also being manufactured in the Atlantic States. The qualities of this steel are very remarkable. When annealed it is so hard that it will stand the best file, but when chilled it becomes soft, when ordinary steel wonld be hardened. When chilled it gets covered with cracks, but it may be very well hammered when at a red heat. But any tools must be made at once with the hammer in their iatended shape, as the file will do notbing more to it. Tools of wolfram steel, planing machines, for instsnce, are said to last much longer than if made of ths best Sheffield cast steel.

Tempering Steel.—P. McCormick, of Newark, N. J., states that he has been engsged iu working steel for the past 30 years, and finds, in new processes, always the same story of "imparting extraordiuary hardness and durability to the poorest quality of steel;" and he says that all external working of steel, after the forgiug is done, has but one effect, namely, that the outer portion cools and contracts first, and so impresses and compacts the interior, that, when a piece is broken, it shows a closer granular appearance after dipping, hut will often be so brittle as to break with a slight blow. And if annealed to its previous condition, it is no hetter than at first.

High Pumping.—At Triumph, Pa., water has to be lifted from the Alleghany River to the summit of Triumph Hill, a vertical height of 685 feet. The horizontal distance is two and three-qnarter miles. The pressnre per square inch in the water cylinders of the steam pumps is 700 pounds. Three pumps are used, each lifting 200,000 gallons every 24 hours. The steam pumps have a piston stroke of 18 inches; the diameters of the steam and water cylinders are respectively 20 inches and 60 inches. The pressure above mentioned in the water cylinder closely approaches that ordinarily employed in the cylinders of hydraulic presses.

The Largest Steam Hammer.—Preparations are being made at the Woolwich Arsenal for the erection of the 30 ton Nasmyth steam hammer, the largest ever conetructed. It will be able to strike a blow equal to the weight of about 800 *tons*, and the bed for the anvil has therefore to be of enormous strength. Au excavation 45 feet square and 20 feet deep has been made, then piles, about 100 in nnmber, driven into the solid gravel about 20 feet and the interstices filled up with concrete; on these was placed a block of iron 30 feet broad and 11 inches thick, weighing 160 tone.

Binary or Bisulphide of Carbon Engines. Mr. Cortise, the famous engine buildcr, Providence, R. I., writes to the *Scientific American* that he has become so much interested in the success of this binary engine that he ie about to undertake a comparative test of the new invention on a large scale, for the express purpoee of determining its economy, if any, over the best forme of the steam engine. We shall look for the reports of the result with great interest.

White Brass.—A new metallic compound has been invented which is called white brass. It ie susceptible of bigh polieh and at the same time it fuses easily, and has been fonnd by carefully conducted experiments to eurpass in durahility all other anti-friction metals against which it bas been tested—it prevents the heating of journals.

The Stove Business.—The etove msnufactories in Troy, New York, at present number 22. They are turning off an aggregate of 200,000 stovee a year, giving employment to about 2,000 men in different capacitiee, as moulders, mounters and fitters, pattern makers and laborers.

S. F. Stock and Exchange Board.

THURSDAY, November 21et, 1872.

The eales at the Board for the week ending Wedneaday the 13th inst., amounted to $2,727,-000. The market has shown no decided activ-ity this week except on Saturday, and although there seems to he a disposition to buy, holdere evideutly anticipate a riee since transactione are limited. It ie reported that an effort will be made to reetrain the Raymond & Ely Mining Co. from paying the December dividend. There is no chance for that that we can until the complainants establish a right to an intereet in the grounde, a queetion for the Nevada courts to decide, and it is to be hoped that they will do eo speedily, eo as to remove all clonds. The mine hae a good reputation, not only for its richness, but what is much more unusual, it is managed in the intereet of etockholdere.

On Friday the 10th. the market wae a little etronger than on the previoue day. Belcher closed $150 higher; Crown Point, $5; Jacket, $5; Savage $2; Chollar, $2; Caledonia, 2; Con. Virginia, $2; Hale & Norcrose, $9; Meadow Valley, $1; Gould & Curry, $5. Pioche was $1 lower; Raymond & Ely, $4.

On Saturday the etock market was etronger still, and pricee were generally higher. Crown Point roee $3; Belcher, $2; Savage, $5; Jacket, $3; Chollar, $3, and most of the Waehoe etocke firm. Raymond & Ely closed $4 lower.

On Monday pricee were steady. Tuesday the businees of the Board wae light and pricee were nearly nominal in the morning. Afternoon Board ehowed it in a better condition. Belcher roee $2; Chollar, $4; Crown Point, $1; Gould & Curry, $10. Raymond & Ely fell to $104 between the Boarde, but rallied to $110 at the cloee.

Wedneday the market was eteady with very little fluctuation in prices. At close, prices were higher and Belcher rose $150; Caledonia, $4; Gould & Curry, $20; Hale & Norcroes, $4; Savage, $6; Raymoud & Ely, $1; Hermes, $2.

To-day the businese done in the Board wae very light, eome of the leading stocks not being called. A notable feature ie the advance of $37 in Gould & Curry over the price of a week ago to-day.

Below will be fouud iteme of intereet from the prominent minee, later than that to be found in our "Mining Summary."

RAYMOND & ELY.—On the 14th the Superintendent eent down $30,950; on the 17th he ehipped $32,193. The laet ehipment, on the 20th was $34,437; previoue ehipmente emounted to $158,755 making a total for 18 daye of $193,192, equal to $10,733 per day. The ledge is looking well in the weet portiou. The work in the shaft is cbanging hack to the quality shown in upper levele, giving good indicatione for next level.

SAVAOE.—For week ending Nov. 16, 1,079 tons of ore were extracted, aseaying $28.88 per ton; 1,049 tons were sent to mill, and 44 tone remained on dump.

HALE & NORCROSS.—For week ending Nov. 16th, 1,363 tons of ore were extracted, 1,316 tone are on the dnmp, and 546 tone were delivered to mill. The eecond level produnce hetter quality of ore than hae been extracted for months.

SILVER PEAK.—The ore being raieed ie very rich, averaging $168.17 per ton; on the 17th ten bare of bullion were shipped.

EUREKA.—The clean up for 6 days' run of 10 stamps was 1,320 ouncee of amalgam.

PHŒNIX.—On the 12th ten tons of bullion were ehipped, valued at $4,090. Developments are highly satisfactory.

The etopes on the BELCHER look well. Four furnacee of the EUREKA CONSOLIDATED are running finely. Rich ore ie reported ae having been struck in the NOONDAY mine. The GOLDEN CHARIOT will ehortly commence shipping hullion. The winze in the HUHN & HUNT ie improving. Four bare of silver bullion were ehipped form the AMADOR TUNNEL on the 10th. The eum of $2,871 wae received from the BELLEVUE on the 11th inst.

THE LONE STAR mine in Highland District, Nevada, wae eold on the 21st inst., and brought a very large eum to Stirling & Co., of Pioche. J. M. Maguire of this city effected the eale.

MINING SUMMARY.

THE following is mostly condensed from journals pub lished in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

MONITOR *Miner*, Nov. 9: A eample of the ore fonud in the 3-ft. body cut through last week at the 75-ft. level of Silver Glance ehaft, aseayed at the rate of nearly $600 per ton.

AMADOR COUNTY.

DRYTOWN.—Amador *Dispatch*, Nov. 16: The Gover has a ehaft down 200 ft., and J. Treigh-lone has determined to sink the shaft 200 ft. deeper.

The proprietor of the Potoei will reeume operatione in their shaft.

PLYMOTH.—Upon the Phœnix is heing erected a splendid 40-etamp mill, which will be in running order in the eonrse of a few weeks.

KENNEDY.—Jackeon *Ledger*, Nov. 16: The new ehaft is down 89 ft., and looks very fine. When the workmen reach 100 ft., a level will be run in to etrike the main lead.

CALAVERAS COUNTY.

GWIN.—Calaveras *Chronicle*, Nov. 16: The eouth shaft ie eunk 600 ft. The 600-ft. level will be immediately commenced. Between the 500 and 600 ft. levels there is an immense body of ore. The 500-ft. level hae heen driven eouth 290 ft., in first-claes ore the entire distance, and the end of the chimney ie not yet reached. The ehaft between the two levele wae eunk through rock that paid $50 per ton, and the quartz in the bottom of the "sump" is richor than at any other point. The exteneion of the 500-ft. level and the einking of the ehaft have uncovered a maes of rock 900 ft. in length hy 100 ft. in depth—known to he of extraordinary richnees—enough to keep the batteriee occnpied for an unlimited time.

HUDSON.—The new machinery ie in readinees for etarting and work will be commenced early next week.

SCIEFFORN.—San Andreae *Citizen*, Nov. 16: Eight hands are at work and the ehaft ie being eunk rapidly.

SHEEP RANCH cleans up every week about $1,500.

EL DORADO COUNTY.

NEW QUARTZ LEAD.—Placerville *Republican*, Nov. 14: Shepard & Whitten have discovered a rich qnartz lead in the 2d Ward of this city. Rock taken out 3 ft. below the eurface, will pay $40 to $50 per ton.

KERN COUNTY.

GRIZZLY BEAR.—Havilah *Miner*, Nov. 9: Prospecting is going on in Grizzly Bear Mt. Dist., with considerable euccese.

PAPOOSE.—This mine is turning out a large quantity of $23 rock.

JOE WALKER.—Bakersfield *Californian*, Nov. 14: This mine ie to be pumped out and set in active operation.

MARIPOSA COUNTY.

HITE MINE.—Mariposa *Gazette*, Nov. 15: The tnnnel is completed, and ie 1,400 ft. in length They etrnck the vein last week and find it rich in gold. The indicatione are favorable for an immense body of very rich ore.

NAPA COUNTY.

MINES.—Napa *Reporter*, Nov. 16: The Pbœnix is nnder full headway. They are working a force of 60 men and gettiug out about $15,000 worth of quicksilver per month. The Washington, Silver Bow and Valley Minee are all at work.

NEVADA COUNTY.

EUREKA.—G. V. *Union*, Nov. 13: The Eureka had a melting yesterday, 15 stamps in 12 daye crushed out gold worth $17,500.

ENTERPRISE.—Nevada *Transcript*, Nov. 13: The machinery from the old Vigilance mine, Ragan Flat, has been taken down and removed to the North Potoei ledge, Gold Flat.

STRUCK IT.—The Rising Star, Devil's Cañon, ie looking firet rate. They have etruck a ledge of eplendid rock in the lower tunnel, all through which gold can be eeen. The ledge ie well defined and ie from 3 to 7 ft. in deptb.

QUARTZ.—The Providence Co., Deer Creek, have a eplendid ledge, and have commenced paying dividende.

The John Schmidt on the north extension of the Wyoming ie paying firet rate. The ledge is 4 ft. thick.

The Gold Run ie being opened.

The Murchie is yielding excellent paying rock.

SAN DIECO COUNTY.

ITEMS.—San Diego *Union*, Nov. 7: Swain arrived last evening from Julian, hringing $900 worth of bullion cleaned up from 25 tons of Good Hope ore.

The Golden Chariot owners are sinking on their lead. The vein ie widening as the ehaft goee down, and the ore is improving in richness.

TUOLUMNE COUNTY.

GRAVEL.—Sonora *Independent*, Nov. 16: The Table M. Alpha Co., have struck the gravel bed of the ancieut river.

Goon.—It is reported that the Spring Gulch Co. cleaned np, on last Sunday, with reeulte showing the rock to pay $70 per ton.

ON THE LOOK.—Some quartz minere are gettiug ready to prospect the region of Pine Log.

Nevada.

EUREKA DISTRICT.

COY HILL.—Eureka *Sentinel*, Nov. 13: A blast was eet off in Mazeppa No. 2, yesterday which

OUR MINING SHAREHOLDERS' DIRECTORY.

brought to light an unexpected quantity of fine ore. It contains a large amount of horn silver, and assays very high; 20 tons of first-class ore is taken out and ready to be worked, besides about 80 tons of second-class ore. Work was commenced yesterday upon the Daisy, and the showing so far is very good.

THE PHŒNIX STRIKE.—We yesterday visited the Phœnix for the purpose of examining the new strike. From the station on the 300-ft. level a drift has been run northwesterly about 200 ft. At the end of this drift a shaft has been sunk 30 ft., from the bottom of which a drift runs northwesterly 32 ft. In this drift, about 12 ft. from its intersection with the shaft, the ore first begins to show, and from this point to the end of the drift it is one continuous mass of ore. Near the end of this drift a shaft is being sunk for the purpose of finding the depth of the deposit. About midway of the 32-ft. drift above mentioned, an incline has been run upwards and westerly at an angle of about 15°. It is 54 ft. in length, and the top, bottom, sides and end are one solid mass of ore. After having inspected this shaft, we descended the other shaft, to the 400-ft. level. From the lowest station in this shaft, a drift has been run northwesterly about 200 ft., from which point it diverges westerly, with the view of reaching the ore deposit above mentioned. This deposit is the largest yet found in the mine.

DUNNENBERG.—Two incline shafts have been sunk, one 140 ft. and the other about 40 ft. Drifts have been run in at various points on the 140-ft. shaft, and in all of them good ore has been found. The vein is of the width of from 3 to 5 ft., of smelting ore, averaging at least $80 to the ton. Over 1,000 tons of ore is on dump ready to be conveyed to the furnaces of the Co. as soon as they start up, and from 8 to 12 men are kept at work daily in the shafts and drifts. In the 40-ft. shaft a large amount of good ore is being developed.

JUNESVILLE.—Has a shaft sunk upon the ledge 100 ft. In this shaft a vein of ore is shown, varying from 3 to 6 ft. in width, and at the bottom fully 8 feet in width. The ore is smelting and of an average value of $80 per ton.

ELY DISTRICT.

BULLION.—Ely *Record*, Nov. 10: The product for the past week is $118,982.43.

SILVER PEAK.—The Condor mill commenced to work the ore last Thursday. There are 200 tons at the mill and 200 on dump, all first-class. Though the inclined shaft is down 120 ft., the mine is not being worked lower than the 90-ft. level. The east level at the 90-ft. station has been opened 70 ft. The face shows a ledge 4 ft. wide, carrying a large body of ore. At the western extremity of the same level, a vein 7 ft. wide is found.

MEADOW VALLEY.—The drift west from the fourth station in No. 7 incline is being driven ahead, as is the Summit shaft. The lower drifts in No. 3 incline are being pushed along rapidly. A goodly quantity of ore is being daily hoisted from the lower levels of the No. 3 shaft, and sent to mill.

FLORAL MILL.—The carpenters are hard at work framing the battery timbers and preparing the block for the stamps. Considerable of the machinery is on the ground.

IVANHOE.—The new shaft has reached 225 ft. The vein is 2 ft. in width, and considerable rich ore is being hoisted. The ledge is showing 3 ft. in width of very rich ore. The hoisting works are expected to arrive every day.

MARION.—Sinking during the week has been vigorously pushed, and its depth has reached 100 ft. The drift was driven 130 ft. and at its face a ledge presented itself dipping easterly. Stoping has been commenced in the drift.

AMANOR TUNNEL.—Now in 330 ft., the face looks magnificent. The winze sunk some distance in the tunnel is 60 ft. in depth, a drift has been run towards the ledge that showed in the tunnel and some very fine rock has been taken out.

NEWTON BOOTH.—The depth is 235 ft. and timbered to 230 ft. Mr. Campbell has let a contract to sink 100 ft.

PORTLAND EX.—A contract has been let to sink 70 ft.

NEWARK.—Sinking the main shaft is being pushed, it is down 455 ft.; when 20 ft. more is added a drift will be run to the south to strike the vein. In the west drift of the first level a winze is being sunk on the ledge, which is 12 ft. in depth. It shows a vein about 18 inches wide with 12 inches of ore. That portion of the ore which is near the foot wall gives assays of $264 per ton, while that taken from near the hanging wall is of a lower grade.

PIOCHE.—Work on the winze below the main incline is being pushed. It is 100 ft. below the lowest station. Last week 160 tons of ore was shipped to the Magnet mill. From the former crushings there has been received about $6,000 in bullion which is still on hand. The production of ore is of a decidedly better quality, the bar assays averaging fully 25 per cent. more than they have yielded of late.

ALPS—Is sinking. The drift is being run for the ledge.

LOUISE.—The shaft is down 150 ft.; the ledge is 3 ft. in width, and a streak of very rich ore has made its appearance within the past week.

CHIEF OF THE HILL.—30 men are at work constantly. The 3 winzes are showing good, rich ore. The Magnet will commence on Monday for this Co. There are about 45 to 50 tons of ore on dump, which shows good assays.

PIOCHE CHAMPION.—The shaft is down 120 ft. and still sinking; 10 men are constantly at work.

HUMBOLDT.

BULLION.—Unionville *Silver State*, Nov. 9: Amount shipped from the Arizona since our last issue was $5,689.

RELIEF DIST.—Work upon the Central Pacific is progressing favorably. A tunnel is being rapidly driven to connect with the lowest workings on the shaft, which has already reached over 200 ft. A fine body of ore over 2 ft. in width is developed in the bottom of the shaft. The mill has been put in complete repair, and has been running steadily for the past 10 days.

TRINITY.—Bradley and Clark with 2 shifts of men are prosecuting work diligently.

GOV. BRADLEY MINE.—Work is about to be resumed. A shaft 100 ft. deep has been sunk on the ledge, from which several tons of excellent ore have been extracted.

REESE RIVER.

BELMONT. — Reese River *Reveille*, Nov. 9: MONITOR CO.—Have cut the main ledge in their lower tunnel; are raising a chute up to the upper workings; are building a new ore house at the mouth of the new tunnel. The Monitor mill is nearly completed; working 60 men.

EL DORADO SOUTH CON. CO.—Taking out very rich ore from the Arizona. The body of ore discovered last week opens finely and proves of greater extent than at first predicted. In the El Dorado the 400-ft level is being pushed forward; next level above continues south in a fine body of ore to the feldtfeldtite ore, being in 175 ft. from main incline. Working 60 men.

EL DORADO NORTH CO.—Have let a contract for sinking a vertical shaft east of their old works.

BELMONT.—Working by contract 30 men.

WASHOE.

SAVAGE.—Gold Hill *News*, Nov. 16: Daily yield 150 tons, worth $27 per ton. The ore body on the 661-ft level of the old mine is holding out and yielding well. The incline is down 40 ft. below the 1600-ft level, in fair sinking ground. The main south drift on the 1600-ft. level is being driven ahead.

CON. VIRGINIA.—The shaft is down 45 ft. below the 500-ft level. Work on the 1167-ft. level through the Gould & Curry shaft is stopped for the present. Drifting and cross-cutting on the 500-ft level is continued with no new developments.

HALE & NORCROSS—The incline is down 317 ft. below the 1500-ft. level. There are rumors of a strike of some kind having been made somewhere on the lower levels.

CHOLLAR-POTOSI. — Daily yield, 160 tons, worth $28 per ton. The different ore-breasts of the old mine are yielding well.

CALEDONIA.—The main west drift and north west drift on the 400-ft. level of the new works are pressed vigorously. The south drift on the 300-ft. level of the old works is in a mixture of clay, quartz and porphyry. The water in the shaft is being rapidly lowered.

BUCKEYE.—During the week a large body of excellent ore has been developed in the south mine, between the first and second stations.

SILVER HILL.—The north drift at the first station has cut, and is still running through a body of fine ore. The winze from the old upper works to connect with the north drift is passing down through an excellent body of ore.

JULIA. — The main east drift is in 290 ft. in good working ground, having passed through a fine body of ore struck two weeks since.

SUCCOR.—The new shaft is down over 300 ft.

MCMEANS.—The main west tunnel is in 700 ft. in good running ground; it is the expectation to strike the ledge in about 25 ft. more.

KENTUCK. — A cross-cut is being made east through the ledge near the Crown Point.

KNICKERBOCKER.—The west drift is in 330 ft., the face in a mixture of quartz and porphyry.

SENATOR.—The shaft is down 285 ft., the entire bottom in barren quartz.

SIERRA NEVADA. — Prospecting the 500-ft. level continues; the ore-breasts in the old mine yield the usual amount of milling ore.

GOULD & CURRY—Is shut down for the want of the necessary supply of wood.

BELCHER. — The drift north of the 1,000-ft. level is in 251 ft. from the incline, and the drift south to meet it 269 ft.; 70 ft. more will complete the connection; the 1200-ft. level looks promising; the incline is down 123 ft. below the 1100-ft. level, in hard-blasting rock; the Kelsey, Sunderland, Pacific, Eureka and Santiago mills are all running on Belcher ore.

IMPERIAL EMPIRE. — The incline is down 55 ft. below the 1700 ft. level, making steady progress; the surface work for the new machinery goes steadily ahead.

SEGREGATED CALEDONIA — Has 2 shafts, one 50 and the other 75 ft. deep, both in brown pay ore.

CROWN POINT.—The 1300-ft. level looks better as farther developed; the cross-cut from the east winze, and the south drift are both in splendid ore; the ore-breasts and stopes of the 1200 and 1100-ft. levels look well.

YELLOW JACKET.—The water is all drained from the lower part of the mine, and drifting east is resumed at the 1500 and 1400-ft. levels. The various cross-cuts at the 1300-ft. level show highly favorable indications for finding a good body of ore.

WOONVILLE.—The ore body looks and yields well, with some improvement in quality. In the south drift the ledge is 25 ft. wide.

BALTIMORE CON. — Shaft 15 ft. deeper, and drift at the 250-ft. level in 67 ft., both shaft and drift in hard rock.

DANEY. — Drift at the 700-ft. level in 63 ft. from the shaft, in hard, blasting rock.

PICTOU.—Work being resumed.

NEW YORK CONS.—Work resumed. Preparing to sink the shaft deeper.

WHITE PINE.

WHITE PINE.—White Pine *News*, Nov. 9: No important changes have occurred during the week.

OUTSIDE DISTS. — ROBINSON. — The Canton Co.'s furnace will start up in a few days. A large body of high grade ore has been struck in the Old Bachelor. The Emma is down 65 ft., showing a large body of high grade ore. The Cecelia is down 15 ft. showing a ledge of high grade ore, rich in gold. The Rathburn is down 50 ft. in good ore. Work has been commenced in the Hayes, and the ore taken out will be sent to S. F. for reduction. Judge Walsh is opening his copper ledges, and getting out ore to be shipped to England.

A contract has been let to run a drift from the shaft of the Old Bachelor which is progressing, and shows a large body of high grade ore. Good reports come from 3 mines partially developed, the Kentucky, Western and Miami. The ore bodies are large and of high grade.

RUBY HILL.—Work has been commenced on the Silver Wreath, Col. O'Connor Sydney will resume the Superintendency; and will soon commence the erection of a 20-stamp mill.

SCHELL CREEK.—The mines generally are looking well.

PIOCHE.—The Stirling and Mocking Bird are improving daily, and it is expected they will soon reach a body of high-grade ore.

WESTERN SLOPE WHITE PINE MT.—TRENCH The east drift is showing some improvement in the quality of the ore. The west drift has struck a body of rich ore, which appears to be of considerable extent.

MILLS.—BIG SMOKY.—Running on custom ore.

MANHATTAN.—Running steadily on ore from the Beecher Cone. Co.'s mines.

TRINITY.—This mill is running successfully on tailings from the Oasis mill, at Shermantown—working about 40 tons daily.

Arizona.

MINES AND MINING.—Prescott *Miner*, Nov. 2: PIMA CO.—Not less than 40 arastras are being run. New discoveries are being made.

MOHAVE CO.—The little mill is almost ready to run.

YAVAPAI CO.—The arastras at Weaver are still running and making money.

Taylor & Smith have their force at work, sinking the well and removing the mill.

Wm. Cole from Bradshaw, brought several fine specimens from the Benton, which assay from $200 to thousands of dollars per ton in silver. Mr. C. has cut across the lode in one place, and found 40 ft. of vein matter between the walls. He has stripped it in another place, and found a vein over 60 ft. wide.

Colorado.

PARK CO.—Central *Herald*, Nov. 6: The Park Pool have purchased a large quantity of good ore, and paid $50,000 cash for the same.

Morgan & Hendereon have run two tunnels on the Sweet Home, and disclosed in each a splendid vein of grey copper, galena and pyrites.

The Moose Co, have taken out this summer nearly 300 tons of ore, which will yield about $450 per ton, several tons averaging $2,000.

The Lincoln Co. have taken out 85 tons this summer; 15 tons shipped to St. Louis yielded 401⅞ oz per ton.

The Lincoln Smelting Co. have nearly finished their extensive works, and will start in a week.

CARIBOU.—Central *Register*, Nov. 6: Work was resumed on the Idaho 2 weeks ago. The owners are running a drift at a depth of 75 ft, which is now completed and they are taking out rich ore.

A large body of ore has just been discovered in the Isabel, at a depth of 10 ft. The Grand View is developing a large and well-defined crevice. The Grand Island is looking well. The Grecian Bend is yielding ore assaying from $112 to $268 per ton. The Sherman ore assays 2,600 ozs. to the ton. S. Beecher Andrews has made a new discovery which he calls the Broome Co. lode. The ore taken at the depth of 2 ft. assayed 20 oz. to the ton, in silver. The Celestial has an 18 inch crevice from which ore is being taken, which yields 16 ozs. per cord under stamps. On Gold Hill the Phœnix is 33 ft. deep. They have a 10-inch crevice, the ore from which will assay $800 to the ton. The Red Cloud carries a well defined crevice.

Montana.

QUICKSILVER.—Virginia *Mountaineer*, Nov. 7: We were shown on Monday some very fine specimens of cinnabar from a ledge in Madison County. The ore assays 40 lbs. of quicksilver to the ton, and the ledge is some 30 ft. wide.

QUARTZ DISCOVERIES.—Deer Lodge *Independent*, Nov. 9: A very rich gold lode was discovered last week on the head of Pike's Peak gulch.

A silver lode has just been discovered within a few miles of town, on which the discoverers have commenced sinking.

BUTTE.—J. Gilchrist is engaged sinking on the Parrott and is down 52 ft. The body of ore is 2 ft. thick; J. D. Allport is sinking a shaft on a lode in Horse gulch and Wm. Regan has discovered a copper vein 30 ft. in width.

RICH GOLD LONE.—Helena *Herald*, Nov. 1: About 10 miles above the crossing of the Little Boulder by the Virginia road there was discovered last winter, one of the most promising gold-bearing ledges in the Territory. A shaft was sunk 40 ft., developing a vein of very rich ore 2 ft. in width. It is proposed to put up an arastra in early spring.

Utah.

SILVER KING.—S. L. *Journal*, Nov. 9: Main tunnel 100 ft., shaft 235 ft. and side drifts and stopings of at least 300 ft. more. The ft. walls are plain and an average distance apart of from 10 to 40 ft., showing galena and carbonates, which work about 80 per cent. lead and from $50 to $70 in silver.

GRAND CROSS has an incline shaft of 40 ft. and a tunnel to connect with the incline a distance of 110 ft.; vein 3 ft., 20 inches of solid galena in bottom of shaft, valued at $45 per ton, hanging wall, blue lime running as a reef, and foot wall quartz rock.

GEORGE PEABODY has a vein 20 inches, running under lime easterly and westerly; shaft 20 ft.; tunnel 50 ft., to tap mine at 90 ft.; 2 shifts constantly working.

EAGLE has a vein 3 ft. 6 inches; galena and carbonate; shaft 28 ft., 10 inches of fine ore; 25 tons on dump; working 3 men.

ALERT.—Running east and west; tunnel 50 ft., and shaft at end of tunnel 10 ft; vein looks well.

MAYBELL.—Vein at top 8 inches; at 50 ft. down it widened out to 4 ft.; the last 50 ft. of shaft run between solid walls 4 ft. apart; ore carbonate and galena, average $60; several assays run, silver, $142, $130 and $110; lead as high as 82 per cent.; average about 62; west drift from bottom of shaft shows 30 inches of solid ore; about 70 tons on dump; shipped about 50 tons.

LITTLE COTTONWOOD.—Cor. Salt Lake *Tribune*, Nov. 14: Davenport has a perpendicular shaft sunk 23 ft. from the surface, and thence, from the bottom is run an incline shaft, following the vein 180 ft. From the bottom of the incline is sunk another perpendicular shaft 45 ft. making the whole distance run 254 ft. The average thickness of vein appears to be 4½ to 5 ft. and the character of the ore is argentiferous (highly metalliferous) carbonates, and oxides of lead. The pulp assays, show $132 in silver to the ton, and 27 per cent. lead. There has been about 10,000 tons shipped from the mine; The tunnel, started from the Little Cottonwood side of the mountain last spring, is in 426 ft. and the ledge will be struck in running 20 ft. further.

MATILDA—Has perpendicular shaft sunk 75 ft. At the bottom there are two lodes run, following the vein, one of them 45 ft. southerly, and the other northerly 50 ft. There are 20 men at work, and the daily yield is about 7 tons.

THE EMMA—Is turning out from 450 to 480 tons per week shipping ore.

Washington Territory.

NEW MINES. — Walla Walla *Union*, Nov. 9: T. Keogh informs us that good diggings have been struck on St. Mary's creek, below the mouth of Perry creek, in Kootenai. Miners are washing from $8 to $10 per day.

New Incorporations.

MINERVA G. AND S. M. CO.—Nov. 14. Location: Butte County. Capital, $3,000,000, in 30,000 shares. Trustees—Robert Sherwood, Warren G. Lockhart, G. C. Perkins, Manuel Eyre, Jr., and Joseph French.

SEMINOLE M. CO.—Nov. 14. Location: West Point District, Calaveras county. Capital, 1,000,000, in 20,000 shares. Trustees—Washington Meeks, Charles J. Collins and Philip Stoner.

MIKADO CONSOLIDATED M. CO.—Nov. 15. Location: Kern District, White Pine County, Nevada. Capital, $3,000,000, in 30,000 shares. Trustees—J. D. Fry, H. K. P. Harmon, Samuel Locke, O. G. Leach and Charles E. Elliot.

SEARSVILLE WATER CO.—Nov. 16. Object: To acquire the waters of the Arroyo, Alambique and other creeks in San Mateo county. Capital, $20,000 in 200 shares. Trustees—C. L. Jones, Wm. Lloyd, Henry C. Downing and August Eikerenkotter.

MINNIE TUNNEL AND M. CO.—Nov. 16. Location: Big Cottonwood District, Utah Territory. Capital, $3,000,000, in 30,000 shares. Trustees—George W. Bowie, H. A. Gorley, H. B. Congdon, J. G. Cockrill and George L. Bradley.

COLEMAN S. M. CO.—Nov. 18. Location: Little Cottonwood District, Salt Lake county. Capital, $5,000,000, in 50,000 shares. Trustees—Samuel Purdy, Geo. F. Sharp, Joseph B. Bidleman, R. H. Sinton and W. V. Wells.

CRYSTAL CONSOLIDATED S. M. CO.—Nov. 14. Location: Grand Island District, Colorado. Capital, $3,000,000, in 30,000 shares. Trustees—J. O. Uhler, S. D. Kreider, Wm. H. Ashton, A. W. Whiting and L. N. Dougherty.

THE HECKERNDORN G. AND S. M. CO.—On the 14th inst., increased its capital stock from $120,000 to $2,400,000, and changed the principal place of business from Mokelumne Hill to San Francisco.

CALIFORNIA SILK MANUFACTURING CO.—Capital stock increased, Nov. 20th, from $50,000 to $100,000.

SILVER SPROUT M. CO.—Capital stock increased, Nov. 20th, from $3,500,000, on 5,000 shares, to $5,000,000 on 50,000 shares.

BACON M. AND M. CO.—Capital stock increased, Nov. 20th, from $800,000 to $2,400,000.

QUICKSILVER.—At a meeting of the trustees of the Washington Quicksilver Mining Co., held last week, Dr. Geo. E. Hinckley was elected President and Treasurer, and H. B. Congdon, Secretary. The claims of this company are located on the newly discovered cinnabar ledge in Trinity county. The mine has recently been examined by Capt. James White, late of the New Almaden mine, whose report to the trustees is very encouraging to the company and they will take immediate steps to push forward the work of developing the same.

LUCKY FIND.—Wm. Ronsh, of Dutch Flat, Placer Co., found last week a nugget of gold quartz, weighing about 20 pounds, which contained $1,600 in gold. It was found 60 feet from the surface.

The Carpenter Bee.

The intereeting and instructive engraving whicb we present thie week, we obtain from that excellent monthly the *Journal of the Farm*, and believe it will be examined with interest; becauee it serves to illustrate the wonderful wisdom or instinct that attaches to one species of the insect world.

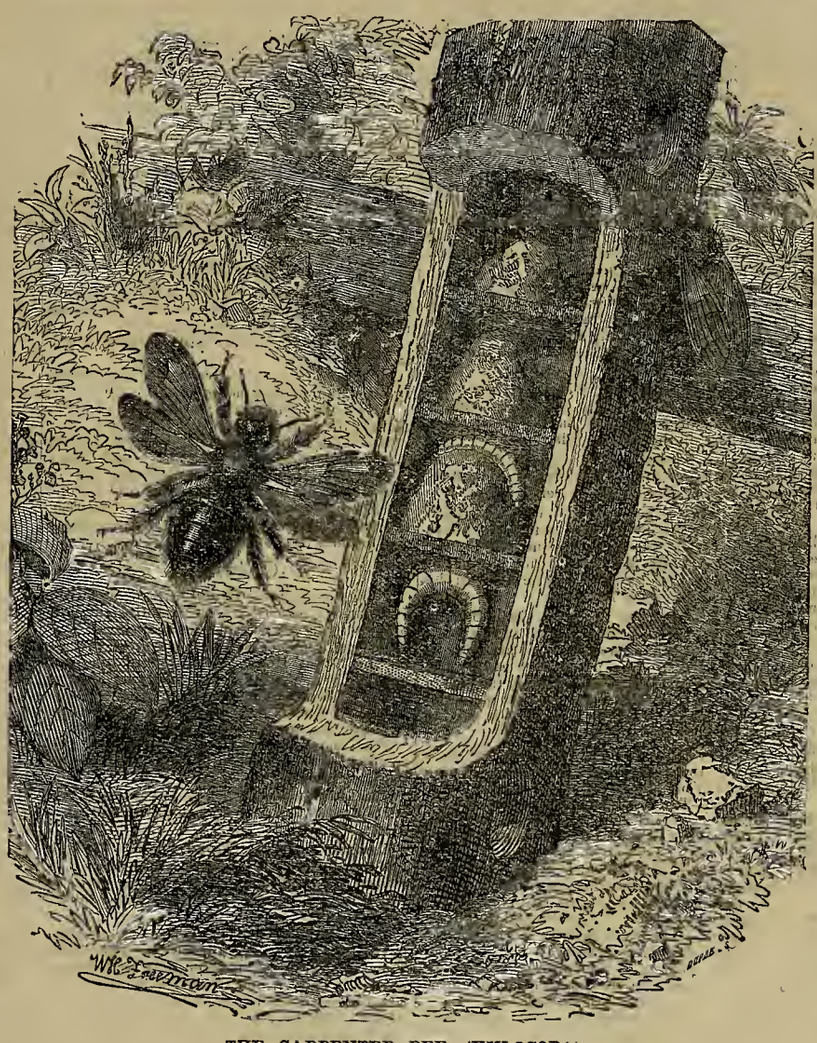
An agreeable writer in the *Schoolday Visitor* says of it: "It is celled the Carpenter Bee, a solitary bee whose eernest life excites ae much wonder and admiration of the student of nature as that of its honey-producing relative.

In the illnstration, the naturalist hes exposed the interior of the cells of thie insect's home, containing the developed lerva or grnb, and ite ood. Tbe grub in the lowest cell first comes to meturity, because the first egg is there deposited, and the partition is constrncted which separatee it from the chamber immediately above it, before the second egg is leid, aud its chember ie filled with appropriate aliment. Yon see, also, the opening immedietely under the the lowest cell, which serves es tbe ontlet throngh which the insect passes when it is ready to bethe its violet wings in the clear ennshine, and tbe eutrance tube at the top, placed at such an angle that the rain cannot enter the perpendicular tube in which are the nursery chambers of the yonng.

The manner in which it makes its many-storied house, and fille its chemhers with provision for ite offspring ie wonderful. Single-handed and untiringly she plies her horn-like jaws, digging out chip by chip till her long tube is prepared. Can yon imagine what her thoughts are as she prosccutes her work, end slowly penetrates the half-decayed wood in which she intends to depost her eggs? Is she reflecting upon the necessity of providing a sefe end comfortable home for her innocent and helpless offspring? Is ehe thinking of the multitude of insecte ever reedy to devour the food her solicitude purposes to store up for her own houechold and that she must protect it from their depredatione? I cennot answer these questions. And I know that insects are not supposed to think at all.

But etill I caunot resist the evidence here afforded of the foresight and maternel care of tbe mother bee. In the structnre of thie remarkeble hebitation, intelligence and design are manifested. And in the size of the tube—its lengtb—the capacity of each chamber, and the amount of food deposited for the nonrishment of the little occupent, there merks a calculeting power very closely resembling the mathematicel operations of the mind. The food, consisting of the pollen of flowers mixed with honey, provided by the insect, makee one think of the mother who, witb the greatest cere, provides for her offspring tbe food best adapted for its nourishment. In this inetence is seen the wonderful beneficence of the Creetor in so instructing the mother insect tbet witbont any previous training, she makes all necessary proviein for the birth, growtb and full development of her progeny.

In their grub state the yonng spend their time in their narrow chambers ehut out from the light of day. Here they are wholly devoted to self. And, as tbough their supreme selfishnees was known to the mother hee, she has divided her cylindrical home into chambers, so that each worm is "monarch of all it eurveys," and cannot intrude upon the rights of othere. It is when fully equipped for its higher life that its selfishness gives place to the disinterestedness of meternel instinct, when, forgetful of self, it consecratee all its energies to the construction of a home aud tbe providing of food for its offspring.



THE CARPENTER BEE, (XYLOCOPA).

Coal in Ireland.—In the geological and mining eurvey of Ireland, the government inspector has reported that that country contains some of the richest coal mines in the world. At present the whole yield from the old collieries is but 130,000 tons per annum, as many of them are worked but feebly, while others are permitted to lie entirely idle.

An Immense Snow Plow.—Tbe Union Pecific Reilroad is having built at ite shops in this city a snow plow, which, when finished, will be the largest and most powerful in the world. It is rapidly approeching completion, and in a few days will be reedy for business. The trucke on which it is built are very heavy and strong, and were cast especielly for this plow. The platform on the trucke is twenty-two feet long, and ten feet six inches wide, and is composed of solid oak timbers eight by eixteen inches. These timbere are held together by ten iron bolts, one and e qnarter inches in diameter, which run crosswise. This solid bed is fastened to the transom beame by forty bolts, twenty over each truck. The inclined slide, placed on the pletform, is twenty-two feet long, and slopes at an angle of thirty degrees, and is held firmly to the bed by forty bolts, of an inch in diameter, end is supported from behind by inclined posts, six feet long, eight inches wide and eixteen inches thick. Tbe entire length from the rear of the platform to the end of the slide is thirty-two feet. Tbe slide is to be ironed, and an immense plow of the ordinary shape, eighteen feet long, eleven feet wide and five feet high, and covered with iron three-sixteenths of an inch thick, is to be securely placed upon it. On the point of thie plow there ie to be an iron plate, steel pointed, eleven feet long and four feet wide. This plete of course runs across the track and only one inch ebove it.

The rear of the pletform will be boxed in, making a room twelve feet high, eleven feet wide and ten feet long, for the purpose of keeping the snow ont. It will be furniehed with a door, so tbat if necessary it can be loaded with iron.

The monster will weigh fifty tons, and will be operated by three of the heaviest engines on the road. The coet will be over $5,000. The design wae gotten up by G. E. Stevens, Superintendent of the car and building department, and J. H. Congdon, general maeter mechanic of the road, who must have made it a study since laet winter. There will be but very few snow-drifte that this plow won't clean out; but if it ever jumpe the track, it will be a pretty hard job to get it on again.—*Omaha Bee.*

Oregon salmon, which were formerly in bad repute, owing to the improper and careless mode of curing and packing them, now command a ready market. There are now $1,000,000 invested in the business. Spiced salmon in tins is much sought after in Europe as an article of luxury, commanding high prices.

Kern County Mines.

The Miuing prospecte of Havilah end ite surrounding districts, says the *Miner*, are of a moet flattering character. The deep mines of the county wbich have been feirly tested, develop what has heretofore been unknown in the mines of this county—and a very important development it is—viz: a remarkable spread in the width of the ledges. By way of illustration we cite the St. Johu and Bright Star mines, which were only three feet in width when first struck. Thcy both held this uniform width until down two hnndred and sixty feet, when the ledges commenced to widen without any decrease in the richness of the quartz, which pays from wall to well the same ae before the extension in width. The ledges are now almoet eight feet in width with a teudency to still increese.

Old mines tbat have been lying idle for the past six years for the want of proper knowledge of tbe menner in which they could be worked profitably, and which were formerly uuder the control of superintendents who never saw a mine before they ceme here, have been relocated and worked to advantage. We can refer to many instances involving great losses; and again, can refer to tbe very same places which, on being worked by competent hande, have paid bandsomely, much to the wonder of its former workere. Tbis only illustrates the vicissitndes and triels tbat have marked the general history of quartz mining on the Pecific coaet. Beginning et a time when labor and material were enormously high, ignorant of the requirements of the business, and overlooking many treacherous elements of defeat, the miuer and millman were beffled alike; and eubject to dieeppointment and lose in conee-queuce of a lack of knowledge concerning mining. Seven years of conetant working and experiment have overcome all former impediments, and mining in this county is no longer an experiment. Not only is the mine and management now here perfect, but the mill and plant are first-clase, all the late labor-saving appliances and otber advance improvements have been added, greatly increasing the efficiency of profitable mining. Kern County, an early placer and a later qnartz mining locality, and one having experienced good and evil fortune, is now recovering from a long season of depression, with a most encouragiug prospect of becoming a flourishing and progreseive mining county. Everything wears an aspect of prosperity, and Havilah will rank as one of the first mining camps of the coast yet.

An Ingenious Device—Mending a Steam Cylinder with Wood.

On a late trip of the steamship *Nebraska* from New Zealand to Honolulu, says the *Chronicle*, the cerpenter of the ship became engaged in a spicy debete with the English steward aboard as to the responsibility of England for tbe destruction of the United States merchant marine by tbe *Alabama*. The debate determined iu a fight, and the two combatants were placed in irone. Upon the arrivel of the *Nebraska* at Honolulu, the carpenter told his grievences to the Americen Coneul there, who thought it best to send him back to tbe United Statee on the *Idaho*.

Wben the *Idaho* was several daye ont on tbe return voyage from Honolulu, her cylinder-head was broken into fragmeuts and the engine conld not be used. She had just reeched a point where the trade-winds failed her; her seils were scarcely large enough to steady her in rough weatber, and retarded as she was by her propeller, the chaucce for getting to San Francisco or even back to Honolulu were rather blue. In an ordinary breeze her sails just gave her headway enough to be steered, and as few vessels cross or follow the Sendwich Islaud steamship route, the passengere resigned themselves to fate and made up their miuds to endure a long and nncertain float. The Capteiu was abont to be petitioned to put passengers and crew on short allowence, when the bellicose carpenter came to their rescue.

A Wooden Cylinder-Head.

On examining tbe injured cylinder, the thought entered his mind tbet a stout cylinder-head of tough, hard wood migbt stand a sufficient pressure of steam to run the engine at moderate speed. He steted this to the Captein, who, after some hesitation and as a last resort, reluctantly gave him permission to try the experiment. The carpenter procured his tool cheet from the hold, and after twenty-five hours hard work, finished and inserted the wooden cylinder-head. It was made of three thicknesses of herd teak board, rendered steam-proof by being covered with paint and canves, and was caulked tight and held in ite piece by bolts as in other cylinder-heade, and by a piece of timber braced against its end. When the cerpenter announced that the engine wae ready for use and desired the engineer to turn on steam, there was a geuerel scemper from the cylinder, where numbere of tbe passengere, sleepless and feverish, had anxiously watched the finishing of the work. Slowly tbe steam was turned on, the piston rod rose and fell, the propeller churned the water quickly, the *Idaho* moved on at ber accustomed speed end the wooden head was a success. Tbe cylinder-head after being ueed for a time swelled and collapsed like the lungs in respiration, but the invention etood the test to the end and eerned for the carpenter quite a reputation. He ie now employed on the *Ajax*, and hae become a very hero among seagoing men.

A passenger from the *Idaho*, who conversed with the reporter, was very enthusiastic in behalf of the ingenione "Cbips," and eays that he is clearly entitled to salvage. Doubtless bnt for his Americen views on tbe *Alabama* claims question, the passengers of the *Idaho*, the majority of whom were Englishmen, would have presented him with some memorial.

Condor Mill.—Is situated 3 miles from Bullionville, between that plece and Dry Valley. It ie a romanticand pleasant spot for thie land of sagebrush, as there is plenty of running weter and shedy treee surrounded by an amphitbeatre of lofty rocks. The mill ie built on quite a novel plen, there being no stampe used, only the patent crusbing machiues. The ore ie received in the upper portion of the mill aud pesees through the Brodie crusher, from thence through the rollers and is amalgemated in 6 Hepburn roller pane. The arrengement is very ingenious and labor-saviug and seeme to be very successful. The machinery is driven by a powerfnl engine the cylinder of which is 14x30. Steam is supplied by a very large boiler 54 inches in diameter containing 62 three-inch tuhes. Complete arrengements havo been perfected to guard against fire, a donkey engine capable of throwing 7,000 gallons in an hour with 150 ft. of 2-inch hose being kept in constant readiness for nse. Mr. S. M. McCurdy is Superintendent of the mill and his efforts to keep matters in good shape are well seconded by those who are working nnder his charge. Messre. Colyer and McWilliame are the amalgamatore. An assay office is attached to the mill which is well arranged and is nnder the charge of Mr. James Buchanan. A hoarding honse is being erected but is not quite finished, owing to the great difficulty in obtaining lumber. We forgot to say that the mill was erected by Mr. W. J. Drew and reflects much credit upon tbe mechanical abilities of that gentleman.—*Piocbe Record.*

Wit does not take the place of knowledge.

Useful Information.

Facts About Belting.

Cement for Either Leather or Rubber Belts.—"Gutta percha, 16 ounces; Indin-rubber, 4 ounces; pitch, 2 ounces; linseed oil, 4 ounces. Cut the rubber in shreds and add the oil, which in a few days will have softened the former. Melt carefully the gutta-percha and pitch together, and stir in the rubber solution or paste. Apply hot to and press the joints."

If two shafts in the same plane, but not parallel, are not belted together, the belt will run towards the ends which are nearest.

A running belt, nearly vertical, will run to the highest side; but belts running nearly at an angle of 45° to horizontal, will run to the end of the pulley where the shafts are nearest together, the pulleys in both cases being straight-faced.

To Lace a Quarter-Twist Belt. — Put the belt on, and bring the ends together in the usual way; then turn one end inside out and lace. The belt will run, it will be found, first one side out and then the other, and will draw alike on both sides.

The theory of cone pulleys is a complicated and difficult one, one element in the solution of which is the distance between the axes of the pulleys; and it is only when this distance is very great in comparison with the diameter of the larger pulley, or when the two pulleys are nearly of the same size, that the rules commonly given will apply. If belts were made of some inextensible substance, the difficulties of adjustment would require more accurate rules; but, fortunately, leather belts readily accommodate themselves to slight errors of construction, although not running in such cases with equal tension.—*Sci. Am.*

Moonlight Reflections. — When standing by a lake side in the moonlight, you see, stretching over the rippled surface toward the moon, a bar of light which, as shown by its nearest part, consists of flashes from the sides of separate wavelets. You walk, and the bar of light seems to go with you. There are, even among cultivated people, many who suppose that this bar of light has an objective existence, and who believe that it really moves as the observer moves—occasionally, indeed, as I can testify, expressing surprise at the fact. But, apart from the observer, there exists no such bar of light; nor when the observer moves is there any movement of this glittering line of wavelets. All over the dark part of the surface the undulations are just as bright with moonlight as those he sees; but the light reflected from them does not reach his eyes. Thus, though there seems to be a lighting of some wavelets and not of the rest, and though, as the observer moves, other wavelets seem to become lighted that were not lighted before, yet both these are utterly false seemings. The simple fact is that his position in relation to certain wavelets brings into view their reflections of the moon's light, while it keeps out of view the like reflections from all other wavelets—*Herbert Spencer.*

To Cut and Bore India Rubber Stoppers. Dip the knife, or cork borer, in solution of caustic potash or soda. The strength is of very little consequence, but it should not be weaker than the ordinary reagent solution. Alcohol is generally recommended and it works well until it evaporates, which is generally long before the cork is cut or bored through, and more has to be applied; water acts just as well as alcohol, and lasts longer. When, however, a tolerably sharp knife is moistened with soda lye, it goes through the india rubber quite as easily as through common cork; and the same may be said of a cork borer, of whatever size. I have frequently bored inch holes in large caoutchouc stoppers, perfectly smooth and cylindrical, by this method. In order to finish the hole without the usual contraction of its diameter, the stopper should be held firmly against a flat surface of common cork till the borer passes into the latter.—*Chemical News*

Boston—Origin of the Word.—In the seventh century a pious monk, known as St. Botolph, founded a church at a place called Y-ccan-ho, on the English coast, Lincoln Co. The town which grew up around it was called Botolph's Town, contracted into Bot-olphs-ton, Bot-os-ton, and finally Boston. It was from this town that the Rev. John Cotton came to America, and gave the same name to the seaport in which he settled in Massachusetts.

Shaping Soft Rubber with a File.—President Morton, of the Stevens Institute, tells us that he finds the ordinary thick sheet rubber used in making up lantern tanks and for many similar purposes, may be readily dressed into exact shape *with a file*, if only it is supported by being clamped between plates of wood or metal in the vise. The file is used dry, and in all respects as in working on wood or metal.

A Mosquito Frightener.—Mr. A. D. Breazele, of Alabama, has patented a mosquito frightener composed of the following formidable ingredients: Oile of pennyroyal, savin, origanum, terebinthe and sassafras, tinctures of lavender, chloroform and armica, gum camphor, nitre, alcohol and kerosene oil. If the Alabama mosquitoes can stand such a preparation as the above, they are proof against anything, and the only remaining thing to be done is to set mouse traps to catch them.

Disintegrating Vegetable Fiber by Steam. The process of disintegrating vegetable fiber for paper stock or for other purposes by the expansive force of steam compressed within the pores of the material, and then allowed to expand suddenly, may not be familiar to all. The operation is performed by means of a strong retort called the "fiber gun," at one end of which is a steam-tight door or valve, so constructed as to be closed and fastened very firmly, but also that, when desired, the fastenings can be instantly loosened, thus allowing the valve to fly open under the internal pressure of the steam. This retort is filled with the material to be disintegrated, the door or valve is closed, and a pressure of from 100 to 200 pounds is admitted, filling the retort and all the pores and interstices with the material. The valve is then released, and flies open with an explosion. The material is shot out of the retort or gun, and the steam compressed within the pores of the material suddenly expands, when the external pressure is relieved, tearing the fiber to pieces. This apparatus is called Lyman's Fiber-gun."

Use of Tannin in the Manufacture of Beer. It is stated by a German authority that the tannin extracted from the gall-nut possesses all the qualities of that which is contained in the flowers of the hop-plant, and that the property of the flowers of preserving and clearing the beer are due to these qualities of the tannin. Fifteen ounces of tannin are stated to be equal to five hundred ounces of the best hops for clearing and preserving the liquor. The tannin is dissolved in eight or ten times its weight of water, and mixed with the wort during ebullition. It is stated to effect a complete clarification, and a deposit well thickened may be seen rapidly forming in the coolers. It is therefore claimed that if the aroma and bitterness of the hop can be dispensed with (a big "if" in our opinion), hops can be advantageously and completely replaced by tannin, which gives a beer sweet and vinous. An entirely new manufacture of beer without hops is thus rendered possible. The employment of wood shavings and other substances containing tannin in condition to be utilized is suggested, and a new era in the manufacture of beer is predicted.

Coffee.—For reasons not revealed, there is a growing deterioration in coffee, from every source of production. It is probably the same cause that deteriorates all fruits and other products, viz., confining cultivation to constant selections without variation. In time, like intermarrying cousins, this inbreeding runs out all vegetable stock. The world is being relieved of worn out tea plants, by new growths in new soil—in India. That country is going very extensively into the coffee culture. Already we find in English papers praises of India coffee that rivals Mocha, Java, and Jamaica. Coffee, in India is becoming an important article of agriculture and export. In the southern counties of Cal., coffee can be grown. We understand that this is demonstrated; and we are assured that, once in bearing, the coffee trees demand little care and insures large profits.

Experimental Chemistry.—Workmen were lately employed to clean out the grease and paint from the inside of the steam cylinder of one of the large ferry boats of the New Jersey Central Railway Company, opposite this city. For this purpose the piston had been duly removed and three men went down into the cylinder, which is 11 feet deep and 50 inches in diameter, taking with them a pail of benzine (petroleum naphtha) which liquid they used in softening the grease. Suddenly a smell snake-like streak of flame started from under the hands of the man nearest the benzine pail, and the next instant an explosion occurred and scattered the burning fluid over the persons of the men.

Solid Bottoms for Fire Grates.—Now that the price of coal is high all over the world the following will be read with interest by the consumers of that indispensable article:—The most practical suggestion yet made toward economy of coal, seems to be the use of solid bottoms in ordinary fire grates. It is asserted, and indeed proved, that in any fire place not excessively small, a plate of iron placed upon the grate will save the consumption of coal, reduce the smoke, and leave a cheerful free burning fire. Quite sufficient air enters through the bars, no poking is necessary, and the fire never goes out till the coals are consumed. There is no ash, and no dust, every particle being consumed. Any householder can try this experiment, and reduce his coal bill, say thirty per cent., at the cost of a shilling.

How to Decoy a Pig.—A correspondent, speaking of the difficulty of swine-driving, says it is as "easy as whistling after you know how," to wit: To the end of a cord tie an ear of corn; drop it in front of a pig within five or six inches of his nose, and commence walking away in the direction you wish him to propel. If his pigship shows evidence of blighted hopes or aberation of mind from the singular conduct of the corn, seduce him into the belief that it is "all right" by letting him have a brief nibble at it, and then resume your line of march. In this way the most obdurate pig may be decoyed at a reasonable distance.

A Harmless Hair Dye.—Dr. K. Kurtz's harmless hair-dye is made in Greece from green walnut burs *Juglans regia* by extracting with water and evaporating until the regianic acid is precipitated as a black powder.

Good Health.

The Cause of an Early Loss of Beauty.

The evils arising from the transgressions of the laws of health, find their greatest extreme among women. Shut up in houses nine-tenths of their time, with either no exercise, or that which is of a limited, irksome sameness, they are, as a consequence, naturally pale, soft, and tender; their blood is poorly organized and watery; their muscles small and flabby, and the force and functions of their bodies, as a whole, run low in the scale of life. A spurious fullness in the outline during girlhood, which usually melts like snow under an April sun whenever the endurance is put to the test, as in performing the functions of a mother. The change in appearance from the maiden of one year to the mother of the next is often so striking and enduring that it is difficult to believe that we are looking at the same person. The round, pleasing shape is prematurely displaced by a pinched angularity, and an untimely and unseemly appearance of age. Travelers from other countries, who have had extensive means of observation and comparison, have remarked upon the great beauty of American women, and the early age at which it is lost. Some have ascribed this to the climate; but more intelligent observers agree that it is mainly due to a hot-house, enervating mode of life. English ladies of rank who, by the way, are celebrated for retaining their beauty even to a ripe old age, think nothing of walking a half a dozen miles at a time; while American ladies would think such a thing "perfectly dreadful." If American women, so daintily and richly fed, will sit in dark and sultry rooms the live-long day, they must expect to bloom too soon, to hasten through this charming period—at the longest in about ten years—and for twenty-five years after, have the grim satisfaction of being thin, wrinkled, angular and sallow.

Bad Air.

Air, the breath of life is the first want of the human being, and it is also the last. At every pulsation during life we need this life sustaining element. Yet one would suppose, by the bad ventilation of houses, churches and theatres, that a man was made to live without air—at least, that it was a matter of indifference whether he had much or little, or whether it was good or bad. We read in the papers of the death of persons from suffocation in wells, mines, or by escaping gas, and we are startled, wondering why people will be so careless; yet thousands of people die by inches, or only half live, in consequence of the impurity of the air which they breathe. If one is shut up in a small room without any admission of fresh air, the air contained within the room soon becomes impure by having been breathed over and over, and very great lassitude or depression of life and spirits is the consequence. The blood requires to be revitalized constantly within the lungs by coming in contact with atmospheric air. Indeed, that is the whole office of the lungs, to aerate or revitalize the blood (which is there met by the atmospheric air), and change it from dark venous blood to bright scarlet arterial blood, thus preparing it to carry life to every part and tissue of the system. In the lungs the blood loses many of its impurities, and takes on the life giving oxygen from the air; and in proportion as the air is abundant and pure which we breathe, in that proportion we have the glow of health and the enthusiasm of living which comes from well-vitalized blood.

Slow Poisoning from Green Wall Paper.—A physician in western Massachusetts recently had a lady patient who, for several weeks, had been suffering from nausea, general prostration, and other symptoms of slow poisoning. Failing to discover the cause of the symptoms, as a last resort the doctor requested her to move from her chamber, the walls of which were covered with paper of a very light shade of green, so light, indeed, that in the evening it could hardly be distinguished from white. After leaving the room the symptoms immediately disappeared, and the patient rapidly recovered. A sample of the paper was forwarded for analysis to the State chemist at Hartford (Joseph Hall, of the High School), and was found to contain a large quantity of arsenic. Mr. Hall obtained the poison in the various forms of metallic arsenic, yellow tersulphite, silver arsenite, and arsenious acid, or common white arsenic. He estimated that every square foot of this innocent looking paper contained an amount of the poison equivalent to five grains of arsenious acid, or double the fatal dose for an adult person. This in the moist warm weather of July and August was amply sufficient to keep the air of a room constantly impregnated with the poison, and any person occupying such a room would be as certainly poisoned as though the arsenic had been taken into the stomach.

Opium is imported into the United States at the rate of five millions of ounces a year, at a cost of two millions of dollars in gold.

Mortality in San Francisco for September, 1872.

In the report of the Boad of Health of this city, for September last, we find the following: There was a decided diminution of mortality in September, compared with the month preceding it. Though the beginning of autumn, when zymotic diseases are prone to increase, it by no means marks an unhealthy period. In 1868, when we suffered from the small-pox epidemic, in 1869, and in 1870, there were more deaths in September than in the same month of the present year. In 1871, however, the mortality was somewhat less. Comparing the present September with the same month a year ago, we find some points of difference, but many of similarity. There was a much greater mortality from cholera infantum, hemoptysis, hydrocephalus, and paralysis, in the former year, and pneumonia, in the latter. The deaths from atrophia, apoplexy, debility, diseases of the heart, typhoid fever, inanition, meningitis, and consumption were about equal in both years. The extraordinary mortality from meningitis in August last was not repeated in September, and but half as many deaths from convulsions occurred in the latter month. Thirty-eight per cent. of the deaths were of children under five years of age; thirty-nine per cent. were females; and forty-two per cent. were natives of California. Fifty-two, or twenty per cent., died in the public institutions. Total number of deaths 260.

Chloroform as an Anæsthetic.—M. Demarquay states that the action of both chloroform and morphine is to lower the animal temperature, and that a combination of the two causes a decrease of 2¼° C. It is asserted that the use of both agents combined as an anæsthetic is extremely dangerous. During an operation performed upon a patient under the double influence, it was remarked that the circulation became interrupted, the arterial blood turned black, and repeated fainting fits took place. In order to avoid these grave consequences, M. Demarquey considers that chloroform should be used singly, but not administered in the ordinary manner. He proposes, instead of saturating a compress or sponge with the agent, to use a flannel mask, on which the chloroform contained in a graduated bottle is turned drop by drop. The evaporation is continuous, and the patient breathes without effort. A year's experience with this apparatus proves that by its use all struggling during the period of excitement is obviated, and that insensibility is easily and gradually attained.

Beds.—These are necessary, as well as convenient and comfortable; but like all other things in this world, there are good and bad beds. Feather beds are injurious to health, and should, therefore, be dispensed with. The way in which many manage them is also very absurd; they rise from them in the morning, make them up steaming hot, close the doors and windows, all till bed-time. Then the scene is acted over again. All beds should be most thoroughly aired after being used, that the gases and odors imparted to them from the human body may be removed. The room, also, should be well ventilated. There are many materials that make more healthful beds than feathers, among which may be enumerated hair, husks, straw, springs, etc.

Colored Spectacles.—The *Scientific American* quotes from a medical authority: "The photographer uses orange colored glass to exclude the actinic rays of light, and why some optician has not had the genius to see that orange is the proper color for spectacles, instead of green or blue, for persons with weak eyes, is beyond my comprehension. A room in the hospital with which I am connected, is lighted through orange colored windows, and is used by patients who have certain diseases of eyes requiring the exclusion of the actinic rays of light. It has been very satisfactory. Orange is also, I believe, the proper color for bottles containing chemicals affected by light."

Sacrifices to Fashionable Surgery.—Under this head the London *Medical Press and Circular*, referring to the increasing number of deaths from chloroform, considers it the duty of British surgeons to investigate more fully than has yet been done, the comparative harmlessness of ether. The editor concludes an article on it in these words.

"Without expressing more than a very strong suspicion in favor of ether, we unhesitatingly say that every life lost by the use of chloroform while we remain in comparative ignorance as to the loudly declared security of the rival anesthetic, is a sacrifice not to the exigencies of surgery, but to inconsiderate prejudice."

Enameled Cooking Utensils Dangerous to Health.—Dr. Zinrek has examined the enamel on hollow-ware sold in Berlin, and reports that the enamel on a stew pan made in Belgium contained so much lead that 15 centigrams of oxide of lead (2¼ grms.) was found dissolved in one liter of vinegar (3 per cent. acetic acid) which had been boiled in it for one hour.—*Amer. Chemist.*

Sunstroke and Whiskey—Physicians say that more than two-thirds of the cases of sunstroke during the past heated term have occurred with persons who were in the habit of drinking liquor.

SCIENTIFIC PROGRESS.—Is Electricity Generated by Water Currents; Sea Serpents; Water Freezing Below 32° Fah.; Water not an Electrolyte; Transparency of Mountain Air; Formation of Sandstone; Action of Magnetism on Molten Steel; Germination of seeds, 323.

MECHANICAL PROGRESS.—Experiment in the Structure of Iron; Improvements in the Arts of Metallurgy; Steel Boilers in England; Compressed Steel; Tempering Steel; High Pumping; The Largest Steam Hammer, 323.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho, Montana, and Utah; Mining Shareholders' Directory, 324-5. Market Reports, 332.

USEFUL INFORMATION.—Facts About Belting; Moonlight Reflections; To Cut and Bore India Rubber Stoppers; Disintegrating Vegetable Fibre by Steam; Use of Tannin in the Manufacture of Beer; Coffee; Experimental Chemistry; Solid Bottoms for Fire Grates; How to Decoy a Pig; A Harmless Hair Dye, 327.

GOOD HEALTH —The Cause of an Early Loss of Beauty; Bad Air; Slow Poisoning from Green Wall Paper; Mortality in San Francisco for September, 1872; Chloroform as an Anæsthetic; Beds; Colored Spectacles; Sacrifices to Fashionable Surgery; Enameled Cooking Utensils Dangerous to Health; Sunstroke and Whiskey, 327.

MISCELLANEOUS.—Copper Smelting; Notes on the Management of Mining Companies, 322. An Immense Snow Plow; Kern County Mines; An Ingenious Device—Mending a Steam Cylinder with Wood; Condor Mill, 326. Encourage Local Manufactures; Lead Ore; California Marble; Mountain Railroads; A Phase of Miner's Life and Death; The Resources of Japan; American Coal, 330. Academy of Sciences; Patents and Inventions; Patent Decisions, 332.

The Comstock Lode and Sutro Tunnel.

The issnes of our paper containing the illustrations of the above lode—October 19 and November 2—were both exhausted without supplying the demand for extra copies, on account of the drawings and descriptions they contained of this noted mineral field and the great work of the Sutro Tunnel, which is now not only of national importance, but of great interest throughout the mining world. We therefore reprint the engravings in an extra edition of this issue of the PRESS, in order to furnish those who desire it extra copies. The illustrations will thus be contained in one number, and render it convenient for examination, and in desirable form for mailing abroad. Papers can be had for 10 cents per copy.

MINERAL SPECIMENS FOR THE VIENNA EXPOSITION.—As many mine owners and others will doubtless find it to their interest to make exhibitions of their ores at the approaching World's Fair at Vienna, the subscriber would respectfully request all such to forward specimens and descriptions of the same, with brief account of the mines, when they may desire to do so, to the office of the MINING AND SCIENTIFIC PRESS, San Francisco. The expenses on such specimens, etc., to this city must be paid by the parties interested, but the expenses hence to Vienna as well as the cost of re-shipment, if required, will be borne by other parties. Proper care will be paid to all specimens of value, and such will be offered for sale at the Exposition if desired. Any confidential communication with reference to mining property may be directed to G. Kustel, Commissioner to the World's Fair at Vienna, care of MINING AND SCIENTIFIC PRESS. We hope that the daily and interior press will agitate this question and encourage miners to forward their specimens.

DEALERS IN MINING STOCKS.—Please notice the advertisement of Mrs. R. D. Hobart & Co., in our advertising columns.

A Coast Railroad South.—Advantages to the Country.

A convention to take action concerning the construction of a narrow-gauge railroad, through San Mateo County, has been called to meet at Redwood City on the 26th inst., and the proposition is said to be meeting with great encouragement. The route of the proposed road has not yet been settled. San Mateo County, under the provisions of the law, is permitted to subscribe $500,000 toward the construction of a road, which, with such private subscriptions as will be forthcoming, will be sufficient to build it. As a subsidy for a railroad through Santa Cruz County was carried at the last election, it is probable that the two will unite and thus form an independent road for over 100 miles south from this city. Although the Southern Pacific proposed to extend their road through Monterey and San Luis Obispo Counties south, it is highly probable that this movement may result in this independent road being carried on through these counties to Santa Barbara. Monterey County has, however, more length along the coast than both San Mateo and Santa Cruz Counties combined, and the lower part is thinly settled; while San Luis Obispo County with nearly as much coast line, is cut up into large three, seven, nine and eleven league ranches, used as sheep and stock ranges, so the population is small and it is sparsely settled. Once these counties are passed through, Santa Barbara will no doubt run a road north and connect with it, and it only remains for Los Angeles and San Diego to co-operate, and we will have an independent narrow gauge road along our coast which will be of vast advantage to the districts through which it passes.

The San Diego and San Bernardino railroad was formally opened on the 11th inst. and it is believed that the work thus inaugurated will be followed up by vigorous operations until the entire line is completed. From San Bernardino the deviation to Los Angeles will be small, and the distance from there to Santa Barbara not great. The people in the sections of country mentioned are all alive to the advantages likely to accrue in having an independent railroad, and will no doubt do all in their power to build it. In our opinion it is only a question of time. The success of the Denver and Rio Grande narrow gauge road, and others in different places has demonstrated the practicability of the system, and it is evident that they will nowhere be so extensively used or to such great advantage as in the mountainous districts of the Pacific slope. The "lower country," as we call it, is suffering under the plague of Spanish grants and large ranches, which necessarily restricts the population from becoming numerous, but were they cut up into even the very respectable acreage of an average California farm, not only the counties but the whole State would be benefitted thereby.

With the construction of a railroad through the counties mentioned, would begin a new era of advancement: naturally increased taxation and higher valuation of the land would compel or induce the large land owners to cut up their ranches in smaller divisions and sell portions. There are thousands and thousands of acres in the lower coast counties, now used as ranges for sheep and cattle, which, by a judicious cultivation could be made productive farms. Under the system at present in vogue, however, they may remain as they are for years and years, and meanwhile those counties see with envy their more fortunate interior and northern sisters materially advancing while they are under the control of a few land-holders, who, like dogs in the manger, will neither make proper use of their land or allow others to do so. These facts are patent to any one familiar with the lower portion of the State, but it is not customary to say much about them, as the idea is prevalent that it will hinder immigration.

In our opinion this is injudicious. What use are emigrants unless they can settle somewhere and make a home? If the lands are all held by a few, there is no place for them to locate. In many instances a man with 20,000 or 30,000 acres of land holds also an almost equal portion of Government land without any expense to him. The reason is that the grants made by the Mexicans were of such a nature as to render it possible for the grantee to take the best land and leave the hilly or mountainous tracts. In consequence of this where these grants cover the level land, the hills are not considered worth taking up, and so remain, and are made use of by the ranch owners as ranges for their cattle. Most of the central portion of the State was affected in the same way, but when the population was increased the large tracts were subdivided, and now, nowhere in the whole State is there a more enterprising, industrious or progressive people than in Napa, Solano and Sonoma counties. They are prosperous and permanent citizens. Small farms are the rule, not the exception. The products are varied and the manufacturing interests rapidly growing. The lower country will never become such until it has such an access of population as shall settle up its lands and have a permanent interest in its advancement. In no other way can this be better accomplished than by building a railroad through the counties mentioned. If such results would follow its completion as are probable, would not the people do wisely in investing in railroads and reaping their profit from increased value of their lands, permanent settlers, increase of products and general advancement proportionate to the importance of their counties.

There is no reason why the Southern counties should not be as prosperous as those north and east of San Francisco. In some respects they have the advantage, and certain products can be raised there through favorable climatic conditions which will not grow in the latter. It is to be hoped that before long a general movement will be inaugurated which will eventually put the whole lower coast in railroad communication with San Francisco, as it will not only benefit this city and the counties through which it passes, but the whole State at large.

Our Home Industries—The Foundries.

In our last issue we gave an account of what work was going on in our city foundries, and promised to continue the subject this week. A noticeable feature is the large amount of mining machinery of all kinds, which is being manufactured, indicating prosperity in that business, and an increase in the number of mines. Most of the foundries are engaged on this class of work, and it is probable that it will increase hereafter year by year. At the

Union Iron Works.

They completed a short time since a 40-stamp mill run with a Leffel turbine wheel, to go to Amador County, Cal. They also turned out a set of hoisting works, saw-mill and hoisting machinery to go to Sierra County. This machinery is all run with one engine, and is so arranged as to be disconnected and geared to a large overshot water-wheel. The shaft of the wheel runs through a tunnel 90 feet long. They built for the same place a 40-stamp gold mill, with Stanford's patent self-feeders run by a horizontal Stetson patent turbine-wheel. These wheels are being extensively used, and a mill at Los Gatos, Santa Clara County, has removed those which they were using and substituted wheels of this pattern. They have also put up a 20x30 hoisting-engine for Virginia City, and a pair of 18x27 hoisting-engines for same locality, with gearing for double set of hoisting-works; made two 54-inch boilers to go with them. Each engine bed had a heavy sole-plate for the gearing set upon. One sole plate of this job was 27 feet long, 32 inches wide, and eight in. thick. It had pillow blocks for the pumping engine, which is 22x48, and shaft of pumping wheel and blocks for hoisting gear set on it also, binding the whole work together. This heavy job has just been shipped. The hoisting wheels to go with it were 12 feet in diameter, and 3½ in. pitch. The wheels were built in sections and bolted together.

Besides this they have built at this foundry a set of hoisting works with 12x20 engine, all complete, to go to Napa County for a quicksilver mine; a 20-stamp and crushing mill complete, for Schellhurn, with eight 5-foot pans, 8 settlers, 8 feet in diameter and 4 agitators 7 feet in diameter, with retorts etc.; engine to go with this job was 18x42 with Scott and Eckert cut-off. They have on hand in the shops now a 20 stamp mill for Pioche, with 16x36 cut-off engine; this is a dry crusher with 6 pans, 5 feet in diameter, and 3 settlers 8 feet in diameter. The mill at Schellburn, as well as that at Pioche, are both being put up by White and Allen, millwrights; the same parties who built the new Raymond & Ely and the Camp Floyd mills. At this foundry they have also on hand a set of hoisting works, with 10x16 engine, all mounted on an iron frame so that it needs no timber or framing on arriving at its destination, being all ready for work. They have been turning out this summer, a number of boilers on odd orders, and a good many of Keyes' patent wrought iron tweere for smelting furnaces. They have, like all the others, been running full all summer.

The Vulcan Iron Works

Started up again about a month ago. They have been making extensive repairs and procuring additional facilities for turning out work. The shops are compact and neat, and everything is in good order. We are glad to see this old established institution again in the field for its share of patronage, and from appearances should suppose it had started in very satisfactorily. They are building two cutting machines for making wrought iron pipe, which are intended to cut a sheet four feet wide without moving the sheet. One of these is for Frank Smith's pipe works in this city, and the other for the California Water Company in El Dorado county. They are building a hoisting engine 12x24 of a new pattern to go to Amador county. Putting up a new cylinder for the engine at the Philadelphia Brewery, and doing considerable shafting and mill work for Treadwell & Co. Making a large number of axles for the North Beech and Mission, and for the Central Railroads. Doing mill work for the Golden Gate Flour mill, which will double its capacity. Building Hydraulic Press for repacking a fibrous material grown in Mexico; two hydraulic pumps are to go with it, one "fill up" and the other a pressure pump. The press rates at 150 tons. Some drying pan work is being done for the Frear Stone Co., and general repairs are being made for the woolen mills, or hoisting engines, etc.

The Pacific Iron Works

Have just completed a heavy contract of hoisting machinery for the Tejo Mine, in Mexico, and also a 15-stamp mill for the San Martin mine in Uruachi, Mexico. This mill was made in sections, no piece weighing over 200 pounds, as it had to be packed on mules part of the way, to reach its destination. They have recently sent a complete set of smelting machinery to Colonel H. F. Beksr, in Wallapei district, Arizona, for use at the mines there. They have also sent recently a set of hoisting machinery to the Arroyo copper mine near Ione City, in Amador Co., and a short time since completed a large order for the California Sugar Refinery, consisting of two vacuum pans, six blow-up pans, agitators, mixers, etc., doubling the capacity of the present works. They have just completed a set of pumping and hoisting machinery for the Hudson M. Co., in Calaveras Co., Cal., a mine recently sold to an English Company; also engine, boiler, pumps, etc., for Belshaw & Co. at the Cerro Gordo smelting works. They are now engaged upon some heavy pump gearing for the Yellow Jacket mine, Washoe, and a set of heavy hoisting machinery for the Kennedy M. Co., in Amador Cal. Building a 10-stamp mill for the Humboldt Canal Co., at Winnemucca, Nevada, and heavy shafting and mill machinery for the Golden Gate flouring mills; doing the usual amount of small and general repairing.

The Golden State Foundry

Has just completed a Knox & Osborne furnace for the California Quicksilver Mining Co., Lake county, and a partial furnace for the Valley Quicksilver Mining Co. in Napa county. Built a 16-stamp mill for the Black Bear mine, Klamath county; a lot of pans and mining machinery for Belmont, Nye county Nevada; quartz machinery to go to Kern county; pans etc., for White Pine; smelting furnace machinery for Idaho; hoisting works for Belmont; quartz mill machinery, stoves, dies, etc. for Washoe. They are just about completing a large lot of iron piers for two bridges in Los Angeles, of the same style as those in the bridge at Niles station, across the bay. They are getting up two double hoisting works, one of which is to go to Pioche; water wheel and machinery for a mill in Amador county; irons for new furnaces for the Oakville Quicksilver Co. in Napa county; a 24-foot overshot wheel for the St. Lawrence M. Co.; furnace work for the American Quicksilver M. Co., Napa county; and doing the usual amount of repairing and small work. At

McAffee & Spier's Boiler Works

They are making a boiler for the steamer Cricket of Los Angeles, locomotive style, high pressure, 5 feet in diameter, with return flues. Also fire box boiler 54x18 for a steam dredger at Portland, Oregon. Building two flue boilers 42x18 for a mining company; one boiler 42x16 and one 36x14, one of which goes to San José and the other is for a mining company. They are putting up a number of tanks for the California Sugar Refinery: also a large number of gasoline tanks used by the Maxim Gas Co. and oil dealers. Doing extensive repairs on boilers of steamers Alameda and Rival. They are quite busy at this shop doing considerable small work and general repairing and employ 70 men.

The Fulton Foundry

Have just finished an engine 10x20 for Wheeler & Osborne, to go to a saw mill at Ukiah; have also completed pumping and hoisting machinery for the New Idra Quicksilver Mining Co. A 6-inch Hooker steam pump for mining purposes is being made, and a large sized Brodie Crusher, for Heynemann & Co., the latter to go to Eureka District. Have recently finished castings for the Marin Water Co. and care for Belshaw & Co. at Cerro Gordo. Doing considerable general and small work.

The Occidental Foundry

Is at present employed making Hepburn pans; shoes and dies to go to Mexico; work for Tustins' windmills, etc. Making Martin's water engines which are generally adopted for use of stores, for hoisting purposes, etc., and small ones of the same pattern are being made for motors for sewing machines. Numbers of these engines are made at this foundry. They are doing considerable carriage and manufacturing work, and making castings for cars, such as boxes, brake-blocks, etc. Doing work for Sugar Refinery and miscellaneous work of all kinds.

The United States Branch Mint.

We here give an illustration of one of the finest buildings in the city, the most important of all the Branch Mints throughout the United States—in fact the largest mint in the world. Its location is on the northwest corner of Fifth and Mission streets.

The Exterior

Is fast approaching completion, and even now is sufficiently imposing to give promise of what its architectural beauty will be, when completed. The style is that which is known as the mixed Doric, and is singularly suitable to building of this class, being at once simple, bold, and strikingly grand, combining at once the characteristics of massiveness and beauty. It is quandrangular in shape and nearly square, being 192 feet in length by 186 feet in breadth, and 50 feet in hight. The front, facing Fifth street, is broken by a grand portico and two projecting wings. The portico which projects twenty feet beyond the main building, will be approached by a superb flight of twenty granite steps, twelve feet six inches in hight. The entablature, the pinnacle of which is thirteen feet higher than the mainhight of the building, is supported by six messive granite columns. The projecting wings in front and rear, project thirteen feet beyond the main building. These break the plainness of the exterior walls, and thus render the whole contour more agreeable to the eye. At the rear ascend two immense chimneys, each seventy-five feet higher than the building itself. The exterior walls are from five feet three inches in thickness at the base, to three feet nine inches at the top, and are deemed sufficiently massive to successfully resist the greatest earthquake shock that has ever been experienced on this coast. They are composed of an outer casing of stone backed with brick. This casing which varies from eight to eighteen inches in thickness in the middle of the walls, and which is two feet eight inches in thickness on the corners, is composed of two kinds of stone. The basement story is cased in massive blocks of granite furnished from the celebrated Penrhyn quarries of Placer county, by G. Griffith & Co. They seem to be capable of resisting the action of wind and weather for untold centuries. The remainder of the building is cased in freestone, furnished by a Californian, from Newcastle Island, British Columbia. No little fault is found with the quality of this stone, and there is no doubt that material superior and also cheap could have been obtained in California. There is no sufficient reason why it should not have been so obtained. But there is more fault to be found with the manner in which it is laid. It is all stratified stone, and should have been laid on its natural bed; instead of that it is placed on its edge parallel to the plane of stratification. This saves money in building, as the expense of cutting becomes thereby an inconsiderable amount, in some slabs almost nothing, but the durability of the whole structure is thereby lessened, as the stone is liable to split and chip off in the plane of its stratification. Besides it is far less able to resist the pressure of the roof, and each layer is less able to resist pressure of the superincumbent ones. We mention these facts without unkindness towards the contractor, but that the Government architect may explain, for his own benefit and the public, if there are any good reasons why the work should be done in such a manner for the United States. Our permanent Government buildings should be such as to praise rather than disgrace American architects and builders.

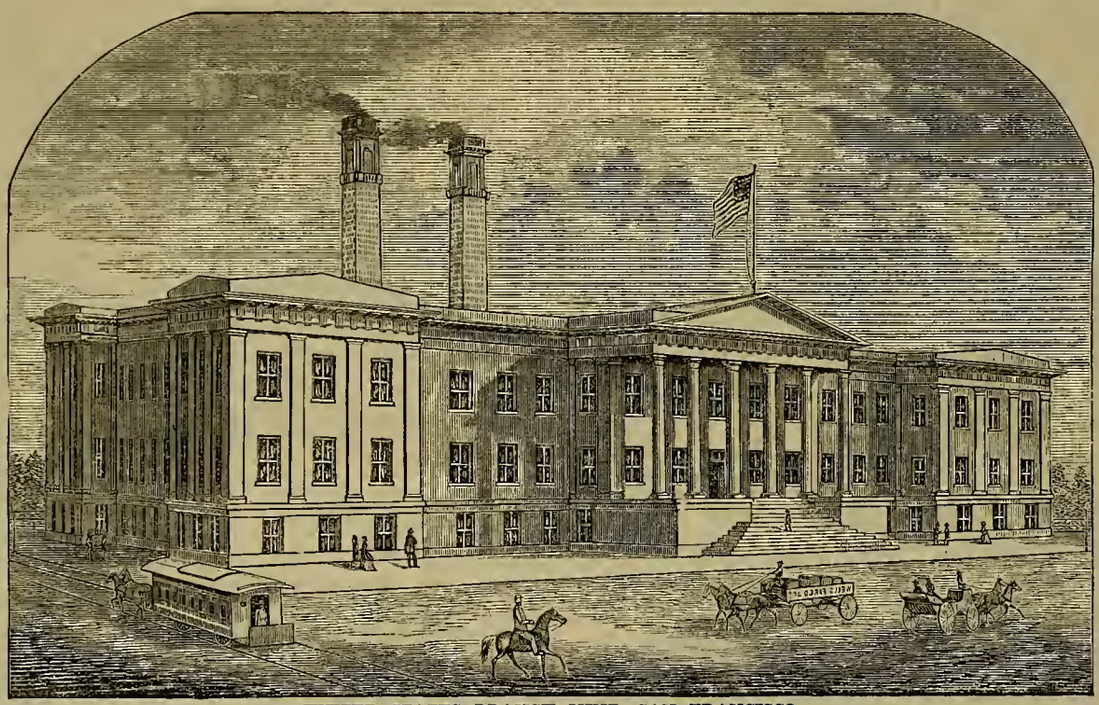
The building will be lighted by 280 plate glass windows with iron panels and mahogany sash.

The Interior

Is constructed on the same general plan throughout all the stories. Entering from Fifth street, you find yourself in a portico twenty-nine feet long and twelve feet six inches wide, leading to a noble corridor which extends the whole of the length of the building, and which will be one of its principle features. This corridor will be one hundred and eighty-eight feet in length by twelve in width, and its appearance when finished, must be highly imposing. Leaving the corridor, and passing on straight through some offices the visitor will find himself in an open court or atrium, in the center of the building one hundred and two feet six inches long and forty three feet nine inches in breadth, round which all the rooms on the various stories are located, which will furnish a thorough ventilation to all parts of the structure, and which will add still more to its resemblance to the classic piles of antiquity. On the second story a corridor will run round the whole court. The central court and the corridors are found on all the stories.

The Basement Story

Contains twenty-four rooms, including one large room fifty-two feet long by twenty feet wide, used as a boiler room. The rest will be used as machine shops, storage rooms for acids, etc., carpenters, etc., shops, sweep cellar for collecting dust lost from the bullion in the various processes of melting, refining, coining, etc.



UNITED STATES BRANCH MINT, SAN FRANCISCO.

The Main Story,

Which is entered by the portico and the vestibule already mentioned, has the space in front between the corridor and the outside walls divided into rooms which will be fitted up as offices for the chief officials of the mint. Behind the corridor and between it and the central court will be the mint banking rooms, and the apartments devoted to the officers of the Sub-Treasury and the Treasury of the mint. These run through both stories. Leaving them we find the grand central court flanked on one side by the melting room, and on the other by the coining room, behind which will be the bath room, annealing room, the ingot rooms, the engine room, etc. Altogether there are on the main story eighteen rooms. The average size of these, as also of those throughout the building, is about twenty-nine feet square, offering thus, magnificent accommodation, when compared to the cribbed, cabined, and confined apartments in which the workmen of the old Branch Mint have now to carry on operations.

The Second Story

Contains eighteen rooms, the same number as the main story. Here are also to be found, as before noticed, banking rooms of the mint. In the front of the building are offices devoted to the General Superintendent, to the principal Clerk, to the Assayer, Messenger, Report Clerk, etc. Flanking the central court on each side are the laboratory and adjusting room, where the coins, otherwise finished, will be weighed and tested by ladies before being allowed to leave the building. In the rear are apartments which will be devoted to capelling and to the humid assay of silver.

The Roof

Will be of fourteen-ounce copper, with sixteen-ounce on the gutters, which will be furnished by the New Haven Copper Company. The rafters will be of massive wrought iron, and the ceiling of the top story will be formed of corrugated iron, which will receive five coats of paint, and will be of a nearly white color. The corrugated iron will be furnished by the American Corrugated Iron Company of Springfield. The two main floors will have cast-iron joists, will be arched and will be finished in concrete. The floor of the basement story will be flagged with the same kind of freestone that is used in upper walls. The mouldings of all the rooms will be of cast iron, and the walls will be finished in three coats of plaster. All the cast-iron used is obtained from the Phœnix Works of Philadelphia.

The Cost

Up to the present has been $900,000. The work was begun in April, 1869, and the exterior will be completed in a very short time. The portico will be finished by the 10th of November, and the steps leading up to it by the end of the same month. The inside will be finished on the arrival of the ornamental iron from Bartlett, Robbins & Co., Baltimore, which is now on the way. The whole building will be thoroughly fire-proof. The number of men at present employed on the works is 65, of which 9 are stone mason. The work when completed will cost $1,500,000, and being not only the finest building of the kind in the United States, but in the world, will be one worthy both of the name and commercial and mineral importance of this coast and of the Golden City.

Corrosion of Gauge Glasses Again.

A correspondent writes from Pioche as follows:—"In your issue of Oct. 26th, you published a paragraph on the waters of Pioche which, according to your correspondent, contain hydrofluoric acid. The only proof given for such an assertion is that the glass pipe of the water gauge of the Pioche mill was etched.

Allow me to tell you that glass pipes, window panes, mirrors, etc., are very often spoiled by the wet air, and that steam under pressure will dissolve slowly all kinds of glass. The silicates of which the glass is composed are more or less soluble in hot water,—the alkaline silicates being carried out, silicate of lime only being left.

To resolve the question directly I have taken two gallons of the water of the Floral Spring Co., the same water used by the Pioche mine. I made this water alkaline by the addition of a little lime water, to fix the volatile acids. This water evaporated slowly, leaving a whitish residue, which placed in a leaden vessel and moistened with sulphuric acid effervesced greatly; but in putting a glass plate above the leaden vessel no traces of etching could be perceived.

I have also tried incrustations of the same water formed on the condenser of the Kentucky mine, which had formed slowly below the boiling point, and I have found these incrustations to be carbonate of lime. Unless your correspondent has found some other sources, hydrofluoric acid is scarce, and I believe it must be very scarce in Nevada, where fluor-spar, so common everywhere, is entirely unknown.

F. E. Durand,
Pioche.

We still adhere to the opinion that the etching or corrosion referred to *may* be caused by the presence of hydrofluoric acid in the water. Our correspondent is mistaken in supposing that fluor-spar is "entirely unknown" in Nevada, as it is frequently found there, although it may be unknown in the neighborhood of Pioche.

Corrosion of the glass pipes of water gauges *may* be due to humic acid, which is known to be a solvent of silica—and which is probably the agent by which vegetable organisms are enabled to assimilate that substance.

Corrosion may also be accelerated in a measure by friction—and no doubt is, especially where it takes place at the point of seperation between the water and steam. The constant agitation of the water at that point doubtless greatly facilitates the action of whatever acids may be present in the water.

We are aware of the destructive action of steam, moisture, and even air upon all kinds of glass; but the rapid corrosion of the tubes in the Pioche mill can scarcely be attributable to those agents alone.

Horse Disease.—The horse disease still continues in the Eastern States, to the great detriment of business. In may cases after the horses have partially recovered, they are attacked with new symptoms, which are said to be more fatal than the original disease. A number of mules in the collieries of Pennsylvenia have been attacked, causing a stoppage of mining and shipping of coal at several points. Fears are entertained that work at the collieries will be temporarily suspended.

Tin From Australia.—It is stated with reference to the probable future of the tin trade, that within 14 or 15 months from this time, 5,000 tons of pure tin metal will be exported from Sydney, and that not less than that quantity can be shipped regularly for years to come.

Transit of Venus.—Not less than twenty astronomers have made arrangements for taking photographs of the transit of Venus over the sun's dial, which is to take place in December, 1874.

Utah Mines.—We see by the Salt Lake *Herald* that Professor J. E. Clayton has recently visited Uintah and Brigham Cañon Districts, and speaks hopefully of their future. In Brigham he gave particular attention to the workings in the upper part of the Cañon, more especially the West Jordan and the Utah Mining Company's property. The West Jordan is presenting very encouraging features. The *Herald* says he speaks of the Utah Company's property with praise, and the magnitude and general arrangement of the works, with the thorough management of the same, elicited from him remarks of surprise. He says the Red Warrior lode contains a deposit of galena ore surpassed in extent only by the Comstock, and but for the low grade of the ore, in silver, it would be one of the most valuable mines on the Pacific Coast. It will be remembered that this property was favorably reported on by Mr. Henry Sewell, an occasional correspondent of ours, and his report is corroborated by Professor Clayton. We understand that the letter gentleman will shortly take up his permanent residence in Salt Lake City.

Encourage Local Manufactures.

One of the greetest drawbacks to the prosperity of San Francisco, end, indeed, the whole State, seys the *Bulletin*, is the want of proper encouragement to local manufectures. We know this is a trite statement; and further, that the truth of it is generally conceded. Great progress has heen made in manufacturing in this city within the past few years, notwithstanding the up-hill work which has been encountered. We are now menufecturing on a scele never hefore attained, hoth as to the variety aud quantity of articles made. Nevertherless, it has required considerahle pluck, loss of money and feith in ultimate success, to reach our present standpoint. What we now want is, that Californians shell patronize home industries. If we can make as good hoots and shoes as are mede in Boston aud other New England cities, and sell them ae cheap, give the preference by all meens to Celifornia goods, and thns retain at home the thousends of dollars annnelly sent abroad for these articles. A considerable chauge has alreedy heeu made in this direction. There is still room for improvement. We have the meterial and the labor and the capital for making all the boote and shoes required on this Coast, and we ehould do it. We will do it just as soon as all our people make up their minds to cover their feet with California-made boots and shoes. It ie said that our Eastern-made caudles cost us about one million of dollars per annum. There is no reason why this money ehould not he kept at home. We have two candle factories here, whose capacities can be largely increased, and they would he thus enlarged, were proper encouragement given. Merchants can do much to facilitate the demand, by embracing every opportunity to introdnce these candles iu the iuterior. It is no apology to say they have no time to atteud to this matter. They must take time. If they cannot see that it is for their interest to make this eacrifice they should give way to others.

We might go on through the list of our local manufactures with similar comments. A safe rule to ohserve ie this: Where the quality of the article is as good as the Eastern made, and the price is as low, purchase California made goods. In this way the millions annually sent out of the State will he retained for the development and improvemeut of home resources. Our local manufactures should he better patronized, while the variety ought to be extended. We can reduce the hoodlum element of this metropolis hy developiug manufactures, thus opening sources of employment for them. A system of thriving mauufacturing interests here will attract skilled workmen from ahroad, thus adding a large and respectable element to our population, creating an enlarged demand for the products of the soil, flocks and herds of California. An increased consumption of agricultural products will of course result in better prices to the farmer, and stimulate that indnstry with others. We shall then be lese concerned ahout ehips to take away our Wheat, Wine, Wool and Leather, and retain much of the freight money uow paid to traneport these products abroad.

Lead Ore.—A few days ago some specimeus of lead ore were received from Kootenay, British Columbia, by Mr. Fisk, of this city. He tested them, and although but a very small quantity of the ore was seut, the assay proved very satisfactory. It was ascertained that about 90 per cent. of the ore was the pure metal. The ore is met with in large quantities in the vicinity of Kootenay. The principal difficulty presented in the working of these mines, is their inaccessibility and the consequent trouble and expense of transporting the ore or metal. When the Canadian railroad is completed, a line of which is iutended to penetrate those isolated regions, these mines will no douht be developed, and become of great value to those who may have the capital and enterprise to work them.—*Oregonian.*

California Marble.—The Grass Valley *Union* has the following: There is an extensive quarry of marhle on the left bank of Bear River, one mile below the lower bridge of the Colfax road. The quarry has been worked for more thau a year, off and on, by a San Francisco company. Marhle of a very fine grain is taken out, and shipped to the bay. At the present time stone is being quarried for a vault in San Fraucisco. The marble is both gray and blue. In this county there is an abundance of fine marble which could be made a valuable industrial resource could it be got to market at reasonable prices.

It is proposed to tap the watere of Tulare Lake at ite lowest level by a navigahle caual, drawing ten feet in depth of water, with a width of 60 feet on the bottom aud 120 feet on the top, and to run this canal to tide water, on a grade of three inches to the mile; and as Tulare Lake is about 250 feet above the level of the sea, it would leave an elevation at Antioch of 200 feet to be utilized as a means of dischargiug grain iuto the holds of ehips. It is English capitel seeking investment in this enterprise.

Mountain Railroads.

The Western Division of the Coloredo Railroad (narrow gauge) has been completed from Golden, a distance of sixteen miles, to a point within three miles of Bleck Hawk. It is now open for business, and has heen in running order for the lest six weeks. Three locomotives formerly in use on the east approach of the Missouri river hridge are now used on this division, and find constant employment in the transportation of freight aud pessengers.

In some respects this is the most remarkable that has ever heeu used for passenger transportation. The line follows the ceñon of Clear creek, which is extremely narrow, in some ceses contracted to a width of 40 feet; it hes precipitous sides, from 80 to 1,000 feet in hight. Through this cañon the railroed finds its way, following closely to the side of the stream, but built upon rock foundation and heyond the reach of high water. The descent of the creek for sixteen miles is one hundred feet per mile, but it is extremely irregnler, in many pleces moving along with very low velocity and at other points plunging over falls from fifteeu to forty feet in hight. The steepest grade used is 175 feet per mile, and the shortest curve is 190 feet radius.

All the cars used are fitted with oue loose wheel at each axle, by which expedient the friction of the curvature is eliminated and the locomotives are enahled to draw trains with ease which it would be found impossihle to move if the cars were supplied with wheels of the ordinary constructiou.

The average speed of the road is eight miles per hour. The operation of a road with these characteristics being in some degree an experiment, the speed has been reduced to a limit which ie perfectly safe. It is anticipated that a higher speed may hereafter be used with entire eafety.

During the constructiou of the road many doubts were expressed ae to the practicability of its operation; but the large amount of husiness which ie now heing transacted over it, and the freedom from accident which has attended ite operation, have reudered it a matter of certainty that with proper care roads of this character, aud often with grades exceeding 200 feet to the mile, may he advantageously used.

The grading of the road hetween Golden and Julesburg, a distance of 215 miles, was commeuced on the 15th of September, and is being prosecuted with a strong force. Forty miles of the road are graded, aud it is expected that the force now engaged on the road will be ahle to grade two miles per day during favorahle weather.—*Omaha Herald.*

Extensive Mining Enterprise.—For several weeks a nnmber of persons have been prospecting and making arrangements for bringing water upon and miuing one of the bars on Flint Creek. The matter was determined a few days ago, the prospecting haviug been favorable and the preliminaries satisfactorily arranged, and a Joint Stock Company with a Capital of $16,000 organized with Jas. H. Batterton, Prest., C. B. Adriance Sec., and E. S. Stackpole Treasnrer. The ground is situated on the east hank of Flint creek, eeven miles above Coberly's. One huudred and sixty acres of ground have been entered as mineral lands and a dump of 100 acres negotiated for. The ground is on a bar 350 feet above the creck, with 20 to 60 feet of gravel, prospecting satisfactorily from the grass roots down. The water is to be obtained from Boulder and Flint creeks. Mr. Batterton has surveyed the line—something less than ten miles in length—and arrangements are ahout consummated to have a ditch of 1,000 inches capacity built this winter. The ditch will be let by contract. It is estimated it will cost about $6,500, and the entire cost when ready for work will not exceed $12,000. A number of prominent men of Deer Lodge and Helena are interested in the enterprise and it is represented to us to promise well for good pay for many years. This is another of several pioneer enterprises we have noted recently looking to the development of the immense quantity of "prospecting" bar diggings existing in this valley, which have hitherto been slighted in the rush for rich gulch diggings, but which promise a permanency of good yield, and which associated capital is turning attention to as the best investment it can make. The day is comiug when "the rivers will rnu to the hills."—*Montana New Northwest.*

Successful experiments have been recently made in England with a new Railway Brake, worked hy electricity. The invention consists in the application of electro-magnets, exerting a force of 600 lbs., to pulleys on a swing shaft uuderneath the carriages. By merely pressing the key the guard is enahled to bring the train to a stand-still.

Gold.—Australia and California, it is estimated, have together produced gold amounting in value to $1,500,000,000 since 1852.

A Phase of Miner's Life and Death.

In October of 1871, there came to Benneck for supplies, a miner riding a mare followed hy a colt. He purchased his goods, peid for them in dust, exhibited a well-stored purse, told some perties he hed a "good thing" on one of the trihutaries of the Big Hole, and got out of town. The seme season a half-breed living in Bitter Root, while hunting on a tributary of the Big Hole toward Salmon, discovered this miner et work, and was paid several hundred dollars not to reveal his whereebouts. It is said the half-breed keeps his compact faithfully. It appears also thet the miuer told parties that in good time he would make puhlic the locality of the diggins, that he wished first to get two or three old frieuds here. This much of life.

During the preseut season the surveying party running the railroad line across the Big Hole and Salmou country, found ou one of the tributaries of the Upper Big Hole the skeletou of a man, evideutly dead some monthe, a eaddle and cantinee, the letter seid to have contained a considerahle amount of gold. Recently Thos. Levatta and Thos. Pamhrum, who have, with "Dominee," heen hunting for the diggings of the mysterious miner in that region found the mare and colt with which he was seen in Bauuack iu '71, hut no trace of the miner or diggings. Ahout a month ago there came to Deer Lodge a party of three meu from the Statee who had a letter of instructions from a miner to out fit at French Gulch, and take a certain trail which would lead them in a direction hy which they could reach the miues, which he told them was very rich. They also had a rude draft of the couutry in which the miues were situated, said to he in a rough couutry covered with thick heavy timher. These meu, and also Levatta's party, are now searching in that immense helt of unknown country for the mines found by the solitary prospector, from which he had taken a good supply of gold to which he had invited his old friends, and in preserving the secret of which he had yielded up the companionship of his fellows, his comfort and his life. These are the liuks of circumstantial fact. It ie fair to iufer that the skeleton was that of the mysterious miner of Bannack, and that in the mountain fastnesses he died, of accident or illness, famished of food or perished of cold will likely uever be known until Time shall end and Death yield its archives to the Great Ruler. We have not learned the uame of the man, but the story, which is true, commended itself as one of those incidents, not remarkable to our Territorial readers, hut showing to those of the older communities a phase of frontier life, and the perils that are sometimes eucountered in the endlees search for gold.

The Resources of Japan.

A writer in *Blackwood's Magazine*, speaking from persoual knowledge of the uatural resources of Japan, says: "In miuerals the country is very rich. The precious and useful metals are found there in large quantities, as well as coal, and a few mines are alrcady worked on an important scale. Rock crystal is ahuudant, pearle and corals are fished along the coast, hut no diamonds, or indeed any other stoues of value, have yet been found. We all know how ahle the Japanese are in metal working, especially in cutlery and gold and copper; we have but a general idea of the matchless finish and subtle delicecy of the handling, and of the talent which that handling reveals. With the skill which they have so long possessed, and with the capacity of imitation (let it he remembered that they built their first steamboat and its engine solely from a description in a Dutch hook), it may he expected that they will soon produce all the hardware with which we uow supply them. In manufacturs generally there has not, so far, beeu much development, though several Europeau erticles, such as window glass, grape wine, and beer are beginning to he made on a small scale. Iu the staple products of Japan, in lacquer, procelain, and silk crape, no change can possibly be wished for; they are so perfeet as they are that foreigners have not leerned to equal them. Indeed, the secret of good lacquer and of weaving silk with the same pattern on both sides has uever been discovered outside Japau.

American Coal.—The exportation of American coal to England has already hegun, and several hundred thousand tons have been purchased on English orders. The purchases are of soft or bituminous coal, which is more commonly used in Europe than the anthracite. Several vessels have left Georgetown, D. C., with cargoes of coal for foreign ceuntries, and others are expected to clear before the close of navigation. English manufacturers will uot be able to compete very long with American industry if they have to use American coal. The manufacturers must come where the coal is cheap.

A new rifle, the invention of a Wurtemhurg gnnsmith, is attracting the attention of the Prussian Government. It is said to be capahle of firing twenty-six shots per minnte, and to have a range of over 1,300 yards.

DEWEY & CO.,

American and Foreign Patent Agents, Publishers of the Mining and Scientific Press, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examiuations of Patents mede here aud at Washingtou; Examinations made of Assignments recorded in Washington; Examinations ordered and reported hy Telegraph; Rejected ceses taken up aud Patents obtained; Interferences Prosecuted; Opinious rendered regarding the validity of Pateuts aud Assignmeuts; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimete knowledge of the various inventious of this coast, and long practice in patent husiness, enahle us to ahundantly satisfy our patrous; aud our success and business are constaulty increasing.

The shrewdest and most experieuced Inveutors are found among our most steadfast friends aud patrous, who fully appreciate our advantages in briuging valuable invcutions to the notice of the public through the columus of our widely circulated, firet-class journals—thereby facilitating their introduction, sale aud popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistauce of co-operative agents, claims in all foreign couutries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxouy, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Hollaud, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealaud, New South Wales, Queeuslaud, Tasmauia, Brazil, New Greuada, Chile, Argeutine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obteinable.

No models are required in European countries, but the drawings aud specifications should he prepared with thoroughness, by ahle persons who are familiar with the requiremeuts and chauges of foreign patent laws—agents who are rcliahle and permauently estahlished.

Our schedule prices for obtainiug foreigu pateuts, in all cases, will always he as low, and in some insteuces lower, than those of any other responsible ageucy.

We *can and do* get foreign pateuts for inveutore in the Pacific States from two to six months (according to the location of the country sooner than any other agents.

Home Counsel.

Our loug experience in obtaining pateuts for Inventors on this Coast has familiarized us with the character of most of the inventious already patented; hence we are frequently ahlo to save our patrons the cost of a fruitless application by pointing them to the same thiug already covered by a pateut. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a pateut.

We invite the acquaintance of all parties connected with inventious and patent right bnsiness, believing that the mutual conference of legitimate husinese aud professional meu is mutual gaiu. Partiee in doubt in regard to their rights as assigneee of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventore to the Government, eometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, hut their inventione also, from thie cause aud consequent delay. We hold onrselves responsihle for all fees entrusted to our agency.

The principal portion of the patent business of thie coast has heen done, and is still heing done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuahle patents may he lost hy the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential mattere, and applicants for patents can rest assured that their communications and business transactione will be held strictly confidential by us. Circulare free.

Engravings.

We have superior artists in our own office, and all facilitiee for prodncing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, aud are alwaye ready to assist patrons in bringing their valuahle discoveries into practical and profitable use.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING OCTOBER 22d, 1872.*

FILTER.—Matthew Cooke and James W. Watt, Sacramento, Cal.

MODE OF LUBRICATING MACHINERY.—Alexander P. Gross, Vallejo, Cal.

REFLECTING-LANTERN.—Emil Boesch, S. F., Cal

LUBRICATOR.—John E. Louergan, Sacramento, Cal.

SASH-HOLDER.—Henry Polley, S. F., Cal., assignor to himself and Anthony Rosenfield, same place.

By Special Dispatch, Dated Washington, D. C., Nov. 19th, 1872.

FOR WEEK ENDING NOVEMBER 5TH, 1872.*

RAILWAY FROG.—William Close, Sacramento, Cal.

MACHINE FOR CROZING AND CHAMFERING.—Otto Osten, Tahoe City, Cal.

DUMPING CAR.—John R. Dubois, Virginia City, Nevada.

TRADE MARKS.

MEDICINE.—Thomas Boyce and Francis McKenzie, S. F., Cal.

WHISKEY —F. Chevalier & Co., S. F., Cal.

MUSTARD.—H. O. Hudson & Co., S. F., Cal.

———*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Text of Interesting Decisions in Patent Cases.

COMMISSIONER'S DECISIONS.

W. T. GARRATT *vs.* N. SIEBERT.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the application of Wm. T. Garratt, filed October* 7, 1871, *and the patent of Nicholas Siebert, granted February* 14, 1871, *for* LUBRICATORS.—*Decided October*, 21, 1872.]

The one first to invent a new and useful device is entitled to the protection of a patent, even if its production was accidental and not appreciated at the time.

LEGGETT, *Commissioner:*

The testimony in behalf of Siebert fixes the date of his invention in May or June 1870. Garratt has introduced in evidence a drawing—"Exhibit A"—representing devices attached by him to the lubricator described in the patent of James Roscoe, December 23, 1862, upon an engine in the San Francisco water works in October 1869. The turning question is whether "Exhibit A" embodies the invention in controversy. The Roscoe lubricator was designed specially to be employed upon locomotives, and to use tallow as a lubricant. It consists of a vessel, to be nearly filled with tallow and closed steam-tight, connected with the steam-cylinder by a pipe entering its upper part above the tallow, and is provided with an air-vessel within and a cock at its bottom for drawing off the surplus water of condensation. The steam heats and melts the tallow, and at each stroke of the piston conveys particles of it, with the water of condensation, into the cylinder. When the steam is cut off; as in descending a long grade, the expansion of the heated and compressed air within the air-vessel causes an overflow of the tallow and the continued lubrication of the machinery. This device proving inefficient, as applied by Garratt to the water-works engine, he connected a vertical pipe with the lower portion of the tallow-vessel and the steam-pipe, and provided it with two cocks near its upper and lower ends. This connecting-pipe extended above the top of the tallow-vessel, and the consequence was, whether foreseen or not, is immaterial, that the steam in the connecting-pipe became condensed and filled it more or less with water. As there were now two steam connections communicating, respectively, with the upper and lower parts of the tallow-vessel, and proper valves for regulating the admission of steam and water in the new connecting-pipe, and the steam-pressure was equal in both pipes, there was practically only the weight of the water left to force up the lubricant, which, even in the original Roscoe cup, was always in a molten state; otherwise the air-vessel could be of no service. This constitutes precisely the device in controversy. There is much to indicate that, as at present understood, it was a mere accident on the part of Garratt. The evidence goes to show that he merely intended to introduce steam into the lower part of the tallow-vessel. His connecting-pipe was not enlarged specially to form a condenser such as is shown in the two cases under consideration. Nevertheless, he presented all the elements of these cases in a practical device, which, according to the testimony "worked well." The law does not contemplate inquiry into the intentions which prompt the construction of mechanical devices. It is only proper to consider what is actually produced, and that, with all its incidental advantages, the inventor or discoverer is entitled to, whether he knows what he has done or not.

I agree with the Board that abandonment is not proved against Garratt, and their decision awarding priority to him is affirmed.

Academy of Sciences.

Fossil Remains in Alaska—The Yellowstone Country.

The regular meeting of the California Academy of Sciences was held on Monday evening last, President Davidson, in the chair. The following new members were elected: H. F. Teschmaker, Professor Ezra S. Carr, and Joseph A. Hoffman. Among the donations to the cabinet were some

Interesting Fossil Remains

Which have just been received by the Alaska Commercial Company, from Elephant Point, in Eschscholtz Bay, Kotzebue Sound. One was a tusk of the *Elephas Primogenus*. It is very symmetrical from socket to point, weighs 155 pounds, 10 feet long and measures in one place 20 inches round. The jaws, with two teeth of the same elephant were also presented. The thanks of the Academy were voted to the company for their liberal and valuable contribution. This is one of many evidences the Academy has received of an awakened interest in its welfare and progress. The deposit where these remains are found, was discovered in 1824. It is at the bottom of a cliff about 90 feet high. These specimens were the only two perfect ones found by the *Eustace* this voyage. The Alaska Commercial Company have promised to assist the Academy hereafter, and know where there are two entire fossil elephants on the Aleutian Islands, and Professor Davidson hoped steps would be taken by the Academy to procure one of these before it should be taken by parties East.

Professor Dall of the United States Coast Survey, stated that the remains of the mastodon abounded along the northern shores of Siberia and of this continent, and are usually found on the surface. In Alaska and other northern portions of America, the snow falls sufficiently in the summer months to expose the bones to the action of the weather, and commonly only the tusks and teeth, being of ivory, are well preserved, and these are so far affected as to destroy their value as a commercial article. The tusk now received by the Academy was the finest specimen he had ever met with. In Siberia, being perpetually imbedded in ice and snow, the fossil ivory is perfectly preserved.

An Interesting Scientific Question

Was connected with the locality where the fossils were met with in Alaska. Kotzebue, who first discovered this deposit, stated that they were found at the foot of a cliff of solid ice, which was covered with a layer of soil. Subsequent examinations had confirmed this fact. But since Kotzebue's visit to that coast a portion of the cliff had disappeared, as if by the melting of the ice, and the depth of the bay had been reduced. This cliff is formed of a solid, clear blue ice, in places surmounted by a layer of from five to six feet of blue clay, and this covered with vegetable mould. From the topography of the country it could not be taken as evidence of glacial action, and it seemed equally improbable that a living stream had ever emerged at this point, and so deposited the carcasses of elephants on the coast and overlaid the ice-barrier with earth. Professor Dall was impressed from observations he had made that the whole coast of Alaska is gradually rising, and landmarks noted there were no more ancient in their emergence than the elephant remains. Among the other donations to the cabinet was a male specimen of the *Chimaera Colei*, a fish found on the coast, with an egg taken from the same specimen. Dr. Kellogg described the *Hibiscus Californicus* or wild hollyhock, which plant has a fibre similar to ramie. It is found in the tules and he thought that this strong fibrous material should be utilized as it might develop an industrial interest.

Professor Davidson then explained some new and abstruse problems in mensuration on the blackboard. Professor Bradley and Dr. Curtis of

The Yellowstone Expedition

Under Professor Hayden, left Ogden early in June, and the party which Professor Bradley accompanied shaped their course for the valley of Snake river. Their route lay through a belt of country that had hitherto been the most unknown of all the great West. Guides were procured among the trappers, but even by these auxiliaries a great portion of the route was traversed for the first time. The party reached Fort Hall on the 3d of July, and sighted

The Tetons,

Eighty miles distant. These famous monuments long since laid down on the maps, were supposed to consist of three prominent peaks; but in reality they embrace considerable ranges, with quite a number of high elevations. The party found the Snake river impassable, and made a circuitous detour to the west of the main Teton. After leaving Fort Hall, for a distance of 100 miles, an outcropping of limestone was noted, with an abundance of trybolites, having the typical form of the Quebec group, This group had not previously been recognized west of the Mississippi valley. The basalt formation was encountered in the valley of the Snake, which extends to the Columbia river. Two extinct craters were reached, and the character of the lava indicated that the overflow had been at a recent period. Quartz pebbles were abundantly mixed with the lava indicating that the eruption had come from below a water bed. To the north of these craters were the sandhills, and a large section of country was broken with domes, some of considerable elevation, formed of loose drifting sands. The central peak of the sandhills is of volcanic rock, rising 1,500 feet above the surrounding level. No distinct crater was found in these mountains, but large masses of volcanic matter in the valleys indicated a volcanic source in the vicinity. Along the valley of the Snake cliffs of basalt rose 1,500 feet perpendicular. At one point a trip of fine grazing ground was discovered, but probably not adapted for grain, from the severity of the winters. In ascending the Tetons, Professor Bradley reached an altitude above the sea of 12,000 feet, and others of the party reached the summit of the highest peak, 13,400 feet. The valleys were once the beds of great lakes. There were found here the upper Silurian and Devonian limestone of the Mississippi Valley, underlaid with the sandstone of the Quebec group. There were also representations of the Potsdam limestone, but presenting no fossils. In the cañons of the Tetons, drifts of snow eighty feet high were encountered. Some of the cliffs towered perpendicularly to the height of 2,000 feet. On one of the summits, reached with great difficulty, were discovered the apparent traces of an ancient fortification, but what purpose such a work was adapted to serve in such a location was a mystery to the explorers. The course of Henry's Fork was followed along a basaltic floor extending to its source, a small lake. On the west side of this lake was

An Immense Crater,

Having a length of two miles by one in breadth and a depth of 1,200 feet. On reaching the base of Sawtelle's Park, evidences of civilization were met with for the first time in many weeks, and on Sawtelle's ranch in this secluded dell in the illimitable expanse, a mowing machine of the latest pattern was noticed in operation. No present volcanic action was met with until reaching the mouth of Gibbon's Fork, from which point the party entered

The Fire Hole Basin,

And encountered hot springs and geysers innumerable. Many of the principal geysers in the basin have received their designations from previous explorers. Some of the larger throw up bodies of hot water from two or three feet in diameter to a height of ninety feet and upwards. "Old Faithful," so-called from its regularity, spouts every sixty-five minutes, throwing a heavy body of water to a height of 160 feet, and continues in action for seven minutes. Others spout at irregular intervals, some not more frequently than once in twenty-four hours.

The Grand Geyser,

Which is the largest and most magnificent known to exist in the world, in its buoyant mood elevates a stream of water to a height of three hundred feet, the eruption being attended with a cloud of steam, and causing the ground to shake violently for some distance round about. Immediately preceding the eruptions of this geyser the ground vibrates as if from the pulsations of an immense steam pump, and these vibrations continue until the column of water descends. The geysers deposit silicious materials in various forms. The general elevation of the region about Yellowstone Lake is between six and seven thousand feet above the sea level, and while camped on the shores of this sheet, the explorers counted 475 prominent mountain points. On the summits of the mountains were found huge beds of gravel showing that they had been below a water surface at some period. A cañon at the outlet of Lewis Lake, adjoining the Yellowstone Lake, was explored, and found to rival in the grandeur of its scenery the great cañon of the Yellowstone. At the base of the Teton range were found indications of

Glacial Action,

And five glacial lakes were examined. A valley, fifty miles in length by ten in breadth, sets off to the east of the Tetons, affording a fine grazing tract, but the temperature unfits it for general agricultural purposes. The exploring party returned to Fort Hall and disbanded in the latter part of October.

Dr. Curtis followed Professor Bradley in a few general remarks on the results of the expedition. In examining the geysers he had found animal life in a temperature of 186°. The creatures were of a peculiar form and evidently in a transition state. The temperature of some of these hot springs the thermometer indicated to be as high as 190°. The elevation of the fire-hole basin is 7,500 feet, and a night seldom occurred during the time the party were encamped therein that frost was not experienced. On the 18th of August they were obliged to break the ice while performing their ablutions, and the surface would again freeze over while one was engaged in the application of the towel, with springs of boiling water springing from all sides.

The Great National Park,

In which all the wonders of nature described are located, embraces 3,795 square miles, according to the lines laid down in the Act of Congress establishing this great "pleasure ground." Within its limits are contained not less than ten thousand boiling springs and geysers of varying character and magnitude. The Yellowstone Lake has a shore line of 375 miles, and its bed is elevated above any piece of land east of the Mississippi. It is undoubtedly the highest body of water in the world. Cascades and cataracts of great magnificence abound in the preserve and many other marvels of scenery and curiosities of nature. The park is easy of access through mountain passes on different sides, and a branch leading thither from the Pacific Railroad could be constructed without encountering any great engineering difficulties.

TELEGRAPHIC COMMUNICATION.—San Francisco is now in telegraphic communication with Adelaide, South Australia, and the Mayors of the two respective cities have exchanged congratulations. According to the New York *Observer*, the distance from Melbourne by the route traversed by the telegraph is 16,000 miles, the largest distance ever traveled by a telegraphic dispatch. Since then the line has been extended to Adelaide, some distance further. The *Observer* says: This telegram came across the Australian Continent, under the Indian Ocean, through the Sunda Islands to Hindostan; under the Arabian Sea, up the Red Sea, across the Isthmus of Suez, under the Mediterranean, across Western Europe to London, under the Atlantic Ocean to New York, whence it flashed across the American Continent to San Francisco, where it was published on the same date that it brought from Melbourne—sixteen thousand miles distant by its route. San Francisco lies in latitude 37 degs. 47 mins. north of the equator, and in longitude 122 degs. 36 mins. west of Greenwich. If the forwarding machinery were perfect a dispatch sent from Melbourne would reach this city 15 hours before the hour which it was dispatched, on account of the difference of time.

GOLD IN VIRGINIA.—The telegraph informs us that a series of well-defined gold-bearing veins have been discovered near Kelly's Ford, five miles from Rappahanock Station, Virginia. The rock is said to yield from $60 to $100 per ton, and the ledges give evidences of permanency.

SCIENTIFIC LECTURES.—Dr. Payne will deliver another free lecture to the ladies and gentlemen of San Francisco, at Platt's Hall, on Monday night, Nov. 25th. Subject: Heart, Lungs and Appendages, etc. The last lecture was listened to by a full house.

San Francisco Metal Market.

PRICES FOR INVOICES.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

And in accordance with law, and an order of the Board of Trustees, made on the third day of October, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at No. 327 Montgomery street, San Francisco, Cal., on the 25th day of November, 1872, at the hour of 10 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.

Office, 28 Merchants' Exchange, California street, San Francisco, Cal. no9-3t

Excelsior Silver Mining Company—Location of works, Yellow Pine District, Lincoln County, Nevada.

At a meeting of the Trnetees of the above named company, held October 29th, 1872, at the office, No. 640 Washington street, San Francisco, it was, on motion, ordered that the following resolution, which was unanimously passed at a meeting of the Stockholders, held October 28th, 1872, be advertised for one month in the Mining and Scientific Press, and a personal notice served on each member:

Resolved—That we, the Stockholders representing in our individual names 4,480 shares of the Excelsior Silver Mining Company, do hereby mutually agree to return our individual certificate or certificates of stock now held by us and standing in our names, agreeing that upon a pro rata division of the entire stock between the stockholder, that we will individually pay a monthly assessment of ten dollars ($10) per month for one year, unless sooner rescinded by the Trustees of said mine.

Also, that said monthly assessment shall be paid on or before the tenth day of each month, commencing November 10th, 1872. By order of Trustees,

W. A. KOLLMYER, Secretary.

no2-1m

Golden Rule Mining Company—Location

of works: Chili Bill, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1872, an assessment of five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at the office of the Company 432 Montgomery street, (Room No. 5) San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the third day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fourth day of January, 1873, to pay the delinquent assesement, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. B RUSSELL, Secretary.

Office, Room No. 5, 432 Montgomery street, San Francisco, Cal.

Great Blue Gravel Range Company—Location of works, Blue Gravel Range, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of November, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 18th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 7th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5 and 6, No. 302 Moutgomery street, San Francisco, California. no23

Hudson Gold Mining Company—Location of works, Cherokee Mining District, Plumas County, State of California.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 11th day of November, 1872, an assessment of 7½ cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 16th day of December, 1872, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 6th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

JOS. L. KINO, Secretary.

Office, 411 California street, San Francisco, California. no16-4t

Indus Gold and Silver Mining Company—Location of works, Virginia City, Storey County, Nevada.

NOTICE is hereby given that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1872, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the secretary, at No. 24 Merchants' Exchange, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23d day of November, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 16th day of December, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, 24 Merchants' Exchange, California street, San Francisco, Cal. oc26-4t

Kincaid Flat Mining Company—Location of works, Kincaid Flat, Sonora, Tuolumne Co., Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 18th day of October, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Milo Hodnley	27	10	$30 00
Milo Hodnley	28	10	30 00

ONE DOLLAR A YEAR

—FOR THE—

PACIFIC COAST MERCANTILE DIRECTOR.

This is a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain reading of interest and importance to all business and professional men on the coast.

OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the fluctuations of the Wheat Markets; Rates of Ocean Freight—corrected monthly; Illustrations and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter; reviews for various branches of trade, including "Grocery and Provision;" "Dry Goods;" "Drugs;" "Building;" "Trades and Manufactures," etc., etc.

Our first issue consist of 16 pages, embracing TWENTY-FOUR COLUMNS of important reading matter for Tradesmen—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

Published by MURRAY, DEWEY & CO.,

At the Publishing Office of the Mining and Scientific Press and Pacific Rural Press, San Francisco.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISOO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosives now in use, and the lifting force of the NEAT BLASTING POWDER, thus making it vastly superior to any other pomponnd now in nee.

A circular containing a full description of this Powder can be obtained on application to our Office.

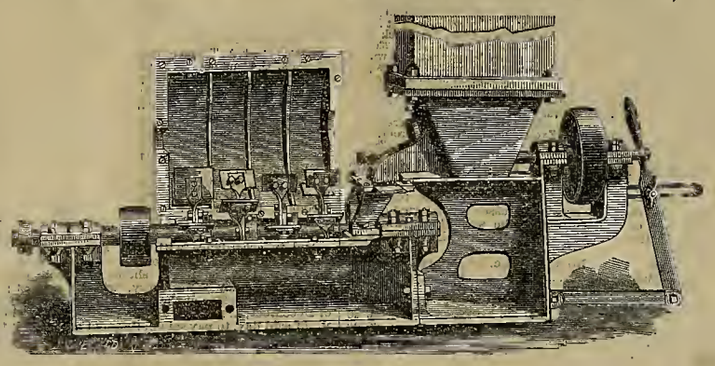
WHELPLEY & STORER'S ORE PULVERIZER,



For Reducing Ores to Fine Powder.

OFFICE OF SWANSEA MELTING AND REFINING COMPANY OF CHICAGO.
CHICAGO, July 15, 1872.

L. P. DODGE, Esq., Agent for Messrs. WHELPLEY & STORER—Dear Sir: Your communication of the 10th instant is at hand. In reply would say that we have been running a Whelpley & Storer Pulverizer for the last six months, grinding ores of different kinds, some of them exceedingly hard. The operation of the Pulverizer has been, in every respect, a complete success, grinding very fine, with but little power required to drive it, and but slight expense for wearing parts. We cordially recommend them to all parties requiring a Pulverizer for mining or other operations. Respectfully J. W. JONES, Superintendent, etc.

May be seen in practical operation on Main street, between Howard and Folsom, San Francisco.

This Machinery has been adopted by nearly all the Eastern reduction works for reducing ores.

Parties purchasing machinery will find it for their interest to examine this before purchasing elsewhere.

9v25-3m GEO. D. WYMAN, Agent Pacific Coast.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test five yeare constant use at the Hoosac Tunnel, and which are now in use in nearly every State ia the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor s the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

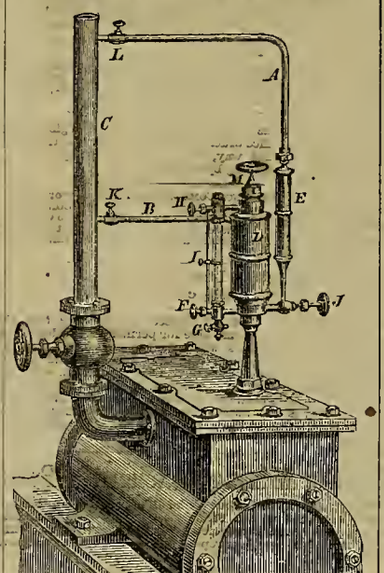
3v24-3m WM. CALDWELL.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe O; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amonnt used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. Ono pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

DEWEY & CO.,

American and Foreign Patent Agents, Publishers of the Mining and Scientific Press, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecnted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Bnsiness promptly and thoroughly conducted.

Our intimate knowledge of the varions inventions of this coast, and long practice in patent business, enable ns to abnndantly satisfy our patrons; and our snccess and bnsiness are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public throngh the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Anstria, Victoria, Peru, Russia, Spain, British India, Saxony, British Colnmbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wnrtemberg, New Zealand, New Sonth Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, bnt the drawings and specifications should be prepared with thoronghness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliablo and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaiuing patents for Inventors on this Coast has familiarized ns with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previons applications which will interfere with their obtaining a patent.

We invite the acqnaintance of all parties connected with inventions and patent right bnsiness, believing that the mntnal conference of legitimate bnsiness and professional men is mntnal gain. Parties in donbt in regard to their rights as assignees of patents, or pnrchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent bnsiness of this coast has been done, and is still being done, throngh our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the valne and patentability of inventions discovered here than any other agents.

Sitnated so remote from the seat of government, delays are even more dangerons to the inventors of the Pacific Coast than to applicants in the Eastern States. Valnable patents may be lost by the extra time consnmed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and bnsiness transactions will be held strictly confidential by us. Circnlars free.

Engravings.

We have snperior artists in our own office, and all facilities for producing fine and satisfactory illnstrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valnable discoveries into practical and profitable nse.

Can't Get Along Without It.

A gentleman writing to our Patent Agency from Ophir City, U. T., August 20th, closes with the following: "I have been a subscriber to your valuable MINING AND SCIENTIFIC PRESS for many years, and I can't see how any miner or millman can get along without it."

Office, 338 Montgomery street, S. F.

THE PACIFIC RURAL PRESS.

A CALL UPON THE PACIFIC RURAL PRESS.—While at San Francisco we availed ourselves of the privilege of dropping in upon our friends of the PACIFIC RURAL PRESS, one of our most welcomed weekly exchanges. The firm of DEWEY & Co. has become a household word throughout the State, from the dignified and valuable character of their publications. These publications also to meet the varied interests of California, and we are glad to know that they are all being sustained generously. During our trip throngh the State we met at nearly every point one or other of their issues.

Besides the RURAL PRESS, they publish the SCIENTIFIC PRESS, which ably serves the mining and other industrial interests of the district.

Recently they have added a monthly sixteen-page newspaper of special interest to wholesale and retail tradesmen, called the PACIFIC COAST MERCANTILE DIRECTOR.

In all these enterprisee we wish our friends abundant success, and we shall long remember their cordial greeting extended a stray editor sojourning a day or two in their beautiful city.—*Philadelphia Journal of the Farm.*

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

Should see that their advertisements are advertised legally and in the **MINING AND SCIENTIFIC PRESS**, at less than one-half the cost of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of dates for weekly advertising, free blanks, and a copy of the Corporation Assessment Law.

U. S. MINING LAWS AND REGULATIONS.—DEWEY & CO., proprietors of the MINING AND SCIENTIFIC PRESS—the American and Foreign Patent Agents of this city—have published in convenient pamphlet form the United States Mining Laws, and the regulations thereof; showing how mining lands may be purchased, manner of obtaining title to mining claims, and giving all necessary instructions to miners how to avoid difficulties with adverse claimants. It is a valuable document—one that every person who is interested in mines should have a copy of. It can be had for 25 cents per copy at their office, No. 338 Montgomery street, San Francisco.

SOCH READERS as feel obliged to stop some other paper in order to subscribe for ours, may send their names along at once, with one year's subscription, and we will give them credit for at least three months' extra time.

SUBSCRIBERS may deduct the cost of a registered letter or postoffice order when they remit us their subscriptions that way, but we will not pay the extra expense of sending by express.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

CONTINENTAL LIFE INSURANCE Co., No. 302 Montgomery street, corner of Pine.

DR. AIKIN.—We are pleased to announce that this physician has come here for permanent residence. In the Eastern cities, where he has engaged in practice, particularly through Michigan, his skill and success have given him a most favorable reputation, and he is acknowledged to be at the head of his profession in the important specialties of which he treats. His responsibility is undoubted, and his credentials entitle him to the fullest confidence. We advise the afflicted to call on the Doctor.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for nine years, during which period it has been rapeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other pnblishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journals; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

STOCK BROKERAGE.

Parties wishing to buy or sell Mining Stocks, please call on Mrs. R. D. HOBART & Co., at their office, 504 Kearny street (up stairs), San Francisco. All orders promptly attended to. no23-bp

READ THIS.
HEALTH FOR ALL.

What is Wealth, or Fame, or Life, Without Health?

Persone afflicted with any Disease, helped or not by other treatment, should consult DR. AIKIN, who effects many astonishing cures, and treats, with unequalled success, all those serious, old-standing diseases (not understood or well treated by the family physicians or others), and performs the more difficult, particular operations in Surgery.

The Approved, Scientific Treatment given by

DR. AIKIN,

Cures Recent and Chronic Diseases of the Eyes, Ears, Throat, Lungs, Heart, Nerves. Stomach, Liver, Kidney and Blood; including Catarrh, Deafness, Discharges from the Ears, Failing Sight; Sore, Weak, or Inflamed Eyes; Cough, Bronchitis, Consumption, Night Sweats, Epilepsy, Paley, Nervous Affections, Debility, Neuralgia, Rheumatism, Dyspepsia, Piles, Dropsy, Scrofula, Fever Sores, Skin Diseases, Erysipelas, Corpulence, Goitre, Hare-Lip, Fistula, Rupture, etc.

Ladies out of Health, assured of Speedy, Safe Cure.

Cancers and Tumors easily removed; also, Warts, Enlarged Tonsils, and Disfiguring Marks.

Young or old, desiring to attain and preserve full health and vigor, no matter what they have read or doctored, first or last, will be given conscientious counsel and reliable aid, without quackery or deception; and those affected with blood or other diseases, who would avoid mercury, poisons, or nauseous drugs, can be sure of obtaining of DR. AIKIN the most efficient treatment by mild remedies, and a rapid, thorough and permanent cure. Those visiting this city (travelers, miners, and others) are advised to consult DR. AIKIN for skillful and satisfactory treatment of any case, medical or surgical. Terms reasonable. Medicines, etc., supplied. Patients, of every class, can rely on the most careful attention and best results. Do not suffer or delay, nor use the worthless, injurious patent medicines.

Whatever your disease or circumstances, or doctoring in vain, do not despair, for you can here be certain of relief if ever curable.

Come prepared to arrange requisite treatment.

Office hours, 9 to 3, and from 4 to 8. Sundays, 12 to 2.

Call, or write symptons carefully, and send (by registered letter, P. O. Order or Draft) $10 to $50, according to case, for Advice and supply of Remedies by Express.

For Description of this Map see page 341.

Notes on the Management of Mining Companies.

BY H. A. THOMPSON, M. E., OF MELBOURNE.

[Concluded.]

Many of these remarks, although written with special reference to quartz mining, are applicable to alluvial works when they are on a sufficiently large scale to deserve the name of a mine.

Methods of Treating the Ores.

The next subject requiring the attention of a company after the cost and risk of finding and raising the gold bearing material has been incurred, is the method to be used for crushing the quartz, and extracting the gold.

On this point many erroneous views are entertained, and the endeavors made to discover improved methods of treatment, have seldom been based on sound principles. Most persons engaged in conducting reducing works, are aware of the great loss of gold sustained, and try to decrease this loss by various means, but there are still too many managers of the class who look on an assertion of this kind as a slur on their ability, and from them little advance can be expected. The great loss sustained in reducing gold ores, in every gold mining country in the world, is not a matter of opinion, but a fact long known and established beyond a doubt by the most carefully conducted investigations, and this in not newer countries only, but in the older mining districts of Europe and South America as well. In Victoria, the loss of gold from the mines whose works are below the water level, may be set down as varying from twenty-five to seventy per cent., this loss usually being in proportion to the amount of sulphides in the quartz. Such being the case, it behooves all companies to bear this fact in mind when laying out the reducing works, and to remember that with even the best appliances the loss must be considerable, and with anything less than the best, it may be greatly increased.

In the erection of crushing machinery they will have to take into account the peculiarities of the material to be crushed, the character of the gold deposit, the quantity and description of the other metallic ores in the quartz, both at the surface and what it is likely to be in depth, together with the amount the mine can supply, the quantity of water available, etc.; before deciding on the extent and kind of machinery that will be most suitable for the mine. In determining on the appliances to be used for separating the gold, and gold-bearing ores from the waste, a knowledge is required of the different plans now in use, the principles on which these plans are based, their respective advantages and defects, to enable a reliable opinion to be formed as to which is the most applicable to the peculiar character of the quartz to be treated. When the machinery has been got to work the whole process will have to be checked, the loss sustained in each part of it determined from time to time, the proper remedies applied, and much valuable material now mostly thrown away, saved for re-treatment. It must be evident that to perform this work satisfactorily, it is necessary to have a thorough knowledge of the metallurgical treatment of gold and gold ores, such as is possessed by few of our managers.

Too frequently this part of the business is placed under the control of the working engineer, and in consequence there are not many crushing-floors where the experienced metallurgist will not be able to point out the means of saving several ounces of gold per week; and in some he will see material holding from one hundred to one thousand ounces of gold per ton wasted. This is only the loss occurring on the crushing-floor,—that in the tailings, after all the ordinary means of separating the gold has been used, requires a distinct method of operating. One instance came under the writer's notice, where, on a small establishment, 200 ozs. of gold was obtained from this apparently valueless material in six months; and about 15 cwt. of poorer material, but still holding over 100 ozs. of gold per ton, was piled, and the gold afterwards extracted. At another place, material was thrown away, holding at the rate of over 1,000 ozs. of gold per ton. These were, probably, extreme cases; but they show what may be lost through ignorance and the prejudice which usually accompanies it.

The great question of the separation of the auriferous sulphides from the waste tailings, and the extraction of the gold they contain, has yet to be encountered; and there can be no reasonable doubt of the result, when one crushing establishment, where the sulphides are very poor, has been making over £2,000 per annum for some time past, by operating on them.

If the gold at present needlessly thrown away were saved, the aggregate profits from our quartz mines would be at the least double what they now are.

Looking back over this outline of the duties to be attended to in establishing and conducting a mine, few will be prepared to assert that they can be performed by a board of directors and a legal manager, having little, if any, practical acquaintance with the subject; or that any but a professional man, having a thorough knowledge of the business, is likely to be capable of conducting such operations to the greatest advantage.

Necessity of a Competent Resident Manager.

The result of this state of affairs is, that the directors have to depend almost entirely on the resident manager, and such is the real position of nearly all the Melbourne companies. The control of the mine is virtually in his hands, and if there is sufficient gold to leave a good profit, the manager is looked on as a first-class man, whatever may be the loss of gold, or however incompetent he may really be; and on the other hand, if there is not gold to pay cost, the management is blamed, not the mine.

Such being the case, it is necessary to enquire into the competency and character of the class to whom the control of the immense expenditure on our gold mines is entrusted.

It is but just to acknowledge that good managers are to be found scattered about our mines, and more especially is this the case on our large quartz fields, men with whom any company ought to be satisfied. But these really competent miners will bear out the statement that the majority of the managers throughout the colony are not qualified to perform the duties they undertake, and will be able to point out case after case where the capital had been squandered recklessly from this cause. Numbers of them are merely working miners who, whatever their knowledge of the mere details of mining work may be, are without the education or capacity required to fit them for the conducting of a mine, and too many do not even reach this standard; while there are few having such an acquaintance with the principles on which the plans used for the extraction of gold should be based, as would enable them to adapt the treatment to the character of the material to be operated on. Indeed, any one well acquainted with the way in which mining companies are usually conducted must feel surprised at the number of successful ventures, rather than at the number which fail.

This Mismanagement

Appears to be one great cause of the losses and consequent disfavor under which the mining interest is now suffering; and if any means could be adopted, tending to check the wasteful expenditure of capital now so common, mining would become a much more certain and profitable business than it can ever be under the present system.

With over six hundred mining companies at work, it is not to be expected that managers, capable of performing all the duties now thrown upon them, can be found for more than a small minority of these companies; and even the best miners would be rendered more useful, if they were in constant communication with a body of men whose experience was not confined to a single mine, a single mining field, or even to the colony. The great majority of the mining companies have, therefore, to fall back on an inferior class of men, certainly not such as would be entrusted with the management of a mine in England, leaving out of sight the important operation of extracting the gold, where the inevitable loss is so considerable, and may be so largely increased by inattention or incompetence. In some instances, more especially in distant and isolated districts, metters are in a still worse state than is here represented; many of the local managers being even without an elementary knowledge of the work they have undertaken, or else they are positively dishonest. In either case, the result to the companies they may represent cannot well be otherwise than disastrous.

Consulting Engineers.

Although it may not be easy to find a complete remedy for this state of affairs, the mischief might at least be greatly mitigated by the introduction of another element into the management. If these evils arise from the want of such practical experience on the part of the board as would enable them to keep an efficient check over the local management, and of a sufficient knowledge of mining and metallurgy on the part of the mining manager, the object should be to supply these deficiencies. This purpose might be in part attained by attaching a consulting engineer to each company, taking care that the company so engaged is acquainted with mining in all its branches, and not merely a mechanical or civil engineer. The consulting engineer would attend to the mining correspondence, either directly or through the legal manager, as might be found convenient, and his duties may be roughly enumerated as follows:

He would lay down or amend the proposed scheme for proving, opening and working the mine; see to the purchase, and find plans for the erection of the machinery; select the stores required for the mine, and see that they were of the right description; take care that the best method of extracting the gold was adopted, and that the gold-bearing material now running away in the waste was utilized, so far as our present knowledge enables this to be done. In supervising the mining correspondence, he would see full information was afforded as to the true state of the mine and the work going on, so as to keep an efficient check on the local management and expenditure. Sometimes through design, but more frequently through inadvertence, the reports give only an imperfect idea of the true state of affairs, managers being more inclined to dwell on the hoped-for results than on the actual facts; and the latter can only be drawn out and separated from the former by those practically acquainted with all the details of mining operations. The arrangement of the workmen and the cost of the work would also be checked, the pay bills drawn out in a simple yet, complete form, and proper plans of the work kept up. Copies of the latter, and the records belonging to them, would be kept in the office, so that the state of the mine, both in the past and present, might be seen at any time by the directors.

Having thus obtained full information of the actual position of the mine, he would attend the board meetings, when required, for the purpose of explaining this to the directors, divesting the questions brought before them of the technical difficulties which render them indistinct, and thus enable the directors to bring their business knowledge to bear on the points they have to decide. Finally, he would make periodical visits of inspection to the mines under his charge, personally examining into the state of each, and consulting with the mining manager as to future arrangements or operations. Such is an outline of the duties of the consulting engineer. He would not supersede or interfere with the functions of the board, the object being to keep them so thoroughly informed of the true state and prospects of the mine as to enable them at once to decide on the right course to be pursued in any contingency, and thus act with the vigor and energy which is so great an element of success in every undertaking. To the local management he would supply the more extended experience which his position enabled him to command, and the good managers would certainly prefer to have their work supervised by one who would form his opinion of their capabilities by that work alone, rather than by the quantity of gold in the vein.

It has been urged that managers would not submit to such a supervision of their work. Considering the class of men we have as manager, compared with the standing of those holding a similar position in Europe—where a like system to the one recommended is in use—such an objection is simply absurd, and no opposition of this kind need be expected, except from those who are conscious their work will not bear inspection.

Another objection which has been urged against the proposed system is the increase it would cause in the cost of management. It is said that companies are not in a position to bear any addition to their expenses; and if the employment of a consulting engineer had this effect, the objection would be a well founded one, as it would indicate that the management was so satisfactory as to leave no room for improvement. The object, however, aimed at is the decrease, not the increase, of the expenditure; and although the salary of the consulting engineer will appear as a distinct item in the accounts, while the saving he may effect does not do so (except, perhaps, in the case of gold wasted, when the amount retained may be approximately determined). Yet even in the mining work it may be shown that such saving will be made. The cost of employing a consulting engineer would be covered if his services resulted in the saving of the labor of one man in the arrangement of the work—a trifling reduction in the price at which contracts are let—or the retention of one ounce of gold per week out of the large quantity now lost. There are few men acquainted with business but will acknowledge that the supervision proposed, when exercised by a competent man, would alone produce such an increased amount of care and attention on the part of the local management as to more than repay its cost, irrespective of the much greater advantage that would be derived from the introduction of improved methods of working the mine and extracting the gold.

Under the proposed system the directors would have a clear and distinct idea of the true position of the company to lay before the shareholders, and much of the distrust now so prevalent would be abated, seeing that it arises more from doubt of the power of the board to detect mismanagement—or to set it right if they do detect it—than from disbelief in the honesty of their intentions. If the board had an officer under their control, whose duty it was to be thoroughly acquainted with the state and prospects of the mine, so as to be in a position to supply them with the information they may require—the knowledge that such was the case would tend greatly to restore confidence to the shareholders, and prevent much undeserved obloquy from falling on directors—who, after all that can be said against them, have still acted to the best of their judgment, and are probably the greatest sufferers from any errors that may have been committed. The system should be blamed, not the directors, as the latter have only followed the plan in general use; and many have no doubt felt its unsatisfactory character, but without seeing in what manner a remedy could be provided.

Some persons may doubt if a sufficient number of competent mining engineers could be found in this colony, willing to enter on such a business; but once let the demand for their services arise, and the best men who are now scattered over the gold-fields would be drawn to Melbourne by the more congenial employment afforded in the exercise of the higher branch of the profession, instead of their time being wasted in looking after the working details that would elsewhere be left under the captains of a mine.

Conclusion.

The concentration in Melbourne of a select body of the best mining engineers, constantly meeting and exchanging information and opinions connected with their professional labors, and whose experience would extend over the whole colony, could not fail to be attended with great benefit to the mining interest, both in elucidating points at present obscure, and in rapidly spreading real improvements over all the mines. At present, if any beneficial results are obtained from new methods of operating it is seldom known beyond the locality in which it is tried, or if a rumor of it reaches outer fields it attracts little attention. In consequence, each mining center has its own peculiar system of working, and local prejudices—in many instances producing a most injurious effect on the property of the district. Instead of this isolation, the accumulated experience of all our mining fields should be brought to bear upon the subject, and then some progress may be made in ascertaining the peculiar characteristics of our quartz veins, and the best methods of treating the gold ores.

It may be said, that at a time when the mining interest is in such a state of depression as at present is not a favorable one for the inauguration of a new system, and many persons may feel inclined to turn from the whole question with distaste, as one they have decided on having no direct connection with in the future. Still, it must be remembered that the great producing interest of the colony is of too much importance to all making this country their home, to allow of its being ignored, and, whatever may be the state of feeling that now exists, the desire to invest in mining companies will again spring up, and the majority of those who now repudiate it will once more enter on the pursuit.

To those still engaged in mining who regret its present depressed state, and who are anxious to raise it from the low position in the public estimation into which it has fallen, it may be urged, that this depression has in a great measure arisen from the mischief attending a system of working which these suggestions propose to remedy, and the adoption of them would tend to restore the confidence so much wanted, while it would prevent a great part of the reckless speculation—to use no harsher term—which has brought such discredit on mining enterprise. If the parties still interested in mining affairs believe that the introduction of the plan described above is likely to be attended by the benefits the writer anticipates, it is for them to bring it into practical operation, as the change can only be effected by those who have the power to carry it out.

California Mining Property in London.—The London market presents a new California stock to the public—"The Quicksilver Mining Company" (limited), capital, 40,000 shares, £5 each, or $1,000,000, for working quicksilver mines in Pope Valley, Napa county, California. From the statements made, the property is 132 acres in extent, about seventy-three miles from San Francisco, and within sixteen miles of St. Helena station of the Napa Valley railroad. Mr. Francis Fowler was appointed to inspect the property for the buyers. He reports that: "On the supposition of working only two furnaces, reducing together 40 tons of ore per day, assaying on an average 4 per cent of mercury (which I consider to be a low estimate, judging from the assay accompanying the report), it would yield as a result $2,720 per day, at the standard price of 85 cents per pound; deducting from this expenses of mining, reducing, and all other charges, which will not exceed $5 per ton, would give a return of $2,520 per day, which, reckoning at only 300 days per year, will produce a net result of $756,000, or £151,000 per annum, which at a capital of $200,000 will pay 75 per cent. dividend. By increasing the number of furnaces, and further development of the mine, I am sure this return may be largely increased." The nominal consideration is £160,000, of which the vendors take £50,000 in paid-up shares, which they are not to sell for or sell for the space of twelve months. These shares are not to receive any dividend until 15 per cent. has been paid to other stockholders. The California manager is Donald MacDonald, Esq., of Napa valley. The London *Times* has seen proper to denounce this Company in very severe terms.

Immense Ore Deposits.

Some months ago we made a report on the Richmond Consolidated in the columns of the *Sentinel*, in which we mentioned the body of ore there as immense. Yesterday, by an order from the District Court, a party of gentleman, including the Superintendents of both the Eureka and Richmond went through and inspected the new workings. The sight exposed is one beyond description; in fact, the enormous quantities of ore in sight make one stand dumbfounded and amazed. And the strangest feature in the case is that the workings have been carried completely through the ground known as the "Lookout," which location belongs to the Eureka Consolidated, and has hitherto been considered of but little value. After a thorough inspection of the various shafts, drifts and inclines, the whole party were prepared to say that no such immense bodies of ore had ever been seen in Eastern Nevada, and perhaps in the world. In one place, Superintendent Fisher exhibited a body of ore, which, by actual measment, would aggregate 40,000 tons of ore in sight, which at a value of $60, would show the the large sum of $2,400,000. This, in connection with the late strike in the Phenix, will cause Eureka stocks to look up again, and place this really meritorious district where she properly belongs—in the front rank.—*Eureka Sentinel.*

The directors of the Boston and Albany Railroad have decided to substitute steel for iron rails upon the entire track of the road as fast as practicable. About 9,000 tons of steel rails have already been purchased in Europe, 4,000 tons of which will be delivered this year, and 5,000 tons next year, and they will be laid as fast as received.

SCIENTIFIC PROGRESS.

The November Atmospheric Wave—An Interesting Discovery.

From time immemorial a succession of great atmospheric waves has been known to commence their flow, usually, in October, upon and over the coasts of England and Western Europe, and to mark the commencement of the winter season in that latitude. The phenomena connected therewith, have been a speculative theme with scientists for the last century or more. Sir John Herschel and others have supposed it was peculiar, and confined to England and Western Europe, which it reaches from the South Atlantic, over which it rolls in long, continued undulations, from October to January, constituting an important element in the phenomenal character of the European winter.

This wave seemed to have reached its culminating violence, this season, in the great gale which burst upon the European coast last week, the disastrous results of which, in the destruction of shipping and human lives, has been reaching us daily by telegraph, during the past week.

A Similar Wave Discovered on the Pacific Coast.

The facts connected with this meteorological phenomenon have been closely studied during the past and the present season, under the peculiarly favorable circumstances presented by the various signal offices of this country and Europe, and the interesting and important fact has recently been announced by the Signal Bureau at Washington that on the 12th of November, almost simultaneous with the advent of the great gale in Europe, a similar atmospheric wave began to break over the shores of Oregon and British Columbia, as shown by the weather telegrams. By the evening of the 13th inst. it had spread over nearly all the Pacific States and Territories, Utah and Nevada. At midnight it was pouring through the passes of the Rocky Mountains. On Thursday, the 14th, it descended upon Colorado, Nebraska and the Indian Territories. On Friday morning it extended in unbroken magnitude from Oregon and Washington Territory eastward through the Great Trough or depression in the Rocky Mountains, the Backbone in Idaho and Montana, and stretched thence to the lower Missouri and Mississippi valleys, and over the western shores of the Mexican Gulf.

This discovery will enable meteorologists to anticipate by many days the approach of winter as it advances from the Pacific Coast eastward, in the great current of westerly winds. It serves to clear up the old mystery of the American winter storms, showing that they originated in the Rocky Mountains, upon whose cold and lofty summits in Utah, Colorado, and Southern Wyoming, the vapors of this wave coming from the warm Pacific are now seen to be condensed in overwhelming snows on the forty-first parallel.

As this vast aerial wave is probably like the English wave, continued in successive undulations for two or three months, it may assist in explaining the comparatively high temperature and light precipitation in the winter along Puget Sound and eastward.

Crystallized Silica From Aqueous Solutions.—In a paper published some time ago, in which the author had attempted to obtain quartz crystals from aqueous solutions of silicic acid, at ordinary pressures and at both ordinary and elevated temperatures, only negative results could be reported. In this series of experiments, attempts were made to obtain crystals after Senarmont's method, in water heated to 200° or 300°, and therefore under pressure. Crystals under these circumstances, were obtained, but small, and evidently consisting of hydrated silicic acid, and with these crystals were numerous granules of silicic acid, consisting of two distinct parts, a nucleus and a coating. Tridymite appeared to have formed, and over it a coating of minute crystals of hydrated silicic acid, which evidently had formed as the temperature had lowered.

His conclusion is that quartz cannot be formed under any circumstances, at ordinary or even at slightly elevated temperatures, or under ordinary pressure, in aqueous solutions. *O. Maschke.*

The Influence of the Sun.—However complicated soever the motions of animals may be, whatever may be the changes which the molecules of our food undergo within our bodies, the whole energy of animal life consists in the falling of the atoms of carbon and hydrogen and nitrogen from the high level which they occupy in the food to the low level which they occupy when they quit the body. But what has enabled the carbon and the hydrogen to fall? What first raised them to the level which rendered the fall possible? We have already learned that it is the sun. It is at his cost that animal heat is produced and animal motion accomplished.—*Tyndall.*

The fact that the atmosphere at and near the sea shore is richer in ozone than it is in inland places has been explained by M. Gornp Besanee, who finds by experiment that ozone is oxygen in a most active condition.

Effects of Slow Action.—Dr. Becquerel gives in the *Comptes Rendus* an account of the results of some experiments which prove that, by slow but continued action, curious interchanges of salts may be obtained; for instance—crystals of aragonite are formed upon a piece of gypsum (lance-shaped variety) kept in a closed vessel in a solution of bicarbonate of potassa; the gypsum has almost entirely disappeared, having become converted into aragonite. A similar piece of gypsum, placed in a solution of arseniate of ammonia, has been converted into arseniate of lime. With a solution of alumiuate of potassa and gypsum, the result is the formation of glauberite (double sulphate of lime and potassa, the latter substituto for the soda in the mineral just named). Pieces of galena, kept for twenty years in a solution of bicarbonate of potassa, have yielded well-defined crystallized carbonate of lead. When pieces of limestone were immersed in a solution of plombite of potassa (solution of oxide of lead in caustic potassa), the result was the formation of beautifully-crystallized hydrated carbonate of lead; malachite has been obtained by the action of limestone upon nitrate of copper, converting it into subnitrate, which in its turn, is converted into malachite by bicarbonate of soda.

Interesting Scientific Experiments.—Prof. Tyndal in one of his Boston lectures, while dwelling upon the effects of polarised light, said: "The study of this branch of optics, leads us into a new world—a world of chromatic beauty. There has been nothing in the past to set beside it but the attraction of gravitation. In these latter days, however, we have a study which may become yet more wonderful—the conversion of energy. He then exhibited plates of selenite of uniform thickness, and it was found that they produced certain definite colors. These plates were arranged as sectors of a circle, each sector being of a different thickness, and thus producing a different color. When the beam was reversed the complement of the first color was produced. The effect was very fine. He sent the beam through some plates that were so arranged that they produced a fine-colored heart's-ease on the screen; Another represented a rooster, with all the shades and tints of color which that fowl generally wears, and far more brilliant. When the beam was reversed the complementary colors resulted, and a rooster was seen with a green comb and its feathers colored with red.

Simple Bleaching Process for Oils.—Mix 100 parts of the oil with 2 parts of a mixture of equal parts of 96 per cent. alcohol and sulphuric acid. Where the acid alone is used some of the oil is converted into resin, which does not take place in this case, for the sulphur ether mixes very gradually with it. The green cloud that soon forms afterward turns black, and after standing 24 to 48 hours forms a slight black deposit on the bottom of the vessel. Poppy and rapeseed oil become as clear as water, but linseed oil, when viewed in thick strata, shows a yellowish color. To remove traces of sulphuric acid the decanted oil is mixed with a few liters of hot water and violently shaken, then left standing.

New Mode for Utilizing Silica.—M. Muller proposes the following new mode for utilizsilica:—Reduce the silicate to an impalpable powder and mix with water to form a thick paste, so that it can be moulded. The silica so prepared, on being heated to a bright red, fuses together, giving a vitreous form of pan silica. If the pulverization is to an impalpable powder the entire mass will be so fused; if only coarsely pulverized the larger grains will be sufficiently fused on their surfaces to agglomerate with the silicious powder and thus form a compact whole, but with a less smooth surface than when the whole mass is reduced to an impalpable powder.

Artificial Indigo.—By a scientific investigation, which for difficulty and complexity is almost unequalled, says Professor E. Davies, the coloring matter of indigo, indigotine, has been added to the list of natural products now made artificially. The process is in no sense commercial; but neither was that by which alizarine was first produced. The way being pointed out, probably improvements will be introduced, and indigo become a product of our own country.

Absorption of Ammonia by Nickel.—Boettger finds that nickel absorbs ammonia like palladium. A piece of nickel used as a negative electrode in acidulated water absorbed 165 times its volume of hydrogen. On being detached from the battery and plunged into water, it gave up the whole of its hydrogen in the course of a few days. Palladium absorbs four times as much, and gives it up more rapidly.

Luminous Fungi.—The Rev. M. J. Berkley describes in the *Gardener's Chronicle*, a very remarkable instance of luminosity in fungi. It occurred in the mycelium of an unknown species growing on a trunk of spruce or larch, and vividly illuminating everything in contact with it. It gave almost light enough to read the time on the face of a watch, and continued for three days.

Effect of the Perfume of Flowers. — The presence of the perfume of lavendar in the air increases the power of absorption of heat sixty times, and anise-seed 371 times; hence the perfume arising from a bed of flowers increases the temperature of the air around them.

MECHANICAL PROGRESS.

Metal Paper Hangings.

Paper hangings for walls are known to everybody. It is now proposed to use hangings made of metal, and an account of this new invention, which comes to us from Paris, has been read before the Society of Arts. The metal employed is tinfoil, in sheets about 16 feet long, and from 30 to 40 inches wide. The sheets are painted and dried at a high temperature, and are then decorated with many different patterns, such as foliage, flowers, geometrical figures, imitation of wood, or landscapes. When decorated the sheets are varnished, and again dried, and are then ready for sale. Tinfoil is in itself naturally tough, and the coats laid upon it in preparing it for the market increase the toughness. The hanging of these metallic sheets is similar to paper hanging, except that the wall is varnished with a weak kind of varnish, and the sheet applied thereto. Thus, in this way, a room or a house may be newly painted, without any smell of paint to annoy or harm the inmates. Moreover, tinfoil keeps out damp, and as the varnish is a damp-resister, the protection to the room is two-fold.

Experience has shown also that cornices, moldings and irregular surfaces may be covered with the tinfoil as readily as the flat surface; hence, there is no part of a dwelling house or public building which may not be decorated with these new sheets; and, as regards style and finish, all who saw the specimens exhibited at the reading of the paper were made aware that the highest artistic effects could be achieved at pleasure. The decoration of small tin plates for ornamental purposes has, we hear, been introduced into Cornwall—the county of tin. In this case, the color and pattern are printed on the plates by means of lithographic stones and rollers; but, to insure excellence and permanence, the plates must be heated. Difficulty was first experienced in keeping the plates at the required temperature, the upper part of the oven being always hotter than the lower; but it was overcome by fitting into the oven a vertical roundabout, which carried the plates from top to bottom of the oven during the whole process of heating. We think there are many purposes to which the plates could be applied beyond that of mere ornament.—*Chambers' Journal.*

Machine for Testing Building Material.—We learn from the *Scientific American* that in a paper read at the recent meeting of the American Society of Civil Engineers, Mr. Robert G. Hatfield, architect, of New York, described a machine made by him for practically testing the strength of building materials. It is a platform scale set in a table, and so arranged with hand wheel and gearing as to produce a pressure upon the platform. This pressure is transmitted in the usual manner, by levers on knife edges, to the scale beam. By an ingenious contrivance suggested by Mr. R. F. Hatfield, the poise upon the scale beam, instead of being moved by hand as the pressure is applied, is made to travel by a clock movement, stopping automatically when reaching the point on the beam which represents the pressure upon the platform, thus indicating truly the highest pressure attained. The following were ascertained by this machine to be the comparative strengths of the several kinds of stone mentioned, being the weight in pounds required to break a bar 1 in. square and 1 ft. long in the clear between the bearings:—

Greywacke, North River, Blue stone	250·76
Eastchester marble	150·77
Portland, Conn., sandstone	94·
Belleville, N. J.	88·47
Bricks, North River, Hard	42·74
Bricks, Philadelphia pressed	41 85
Bricks, Perth Amboy	26·36

The above were the best results. Some specimens of materials from the same localities exhibited considerably less strength than that here indicated.

Woven Fabrics from Rabbits' Hair.—The *Austrian Exhibition Gazette* calls attention to a new and important industry, viz., the incorporation of rabbits' hair with wool and cotton in weaving textile fabrics. The shorter hairs which are incapable of being woven, are readily purchased by felt hat manufacturers at $3 a pound. When properly prepared, the hair affords a good strong yarn, which is said to be in no way inferior to wool. If all that the Austrian journal says on the subject be true, the raising of rabbits will soon become an important business. No animal is better adapted to raising on a large scale than the rabbit; they multiply almost as rapidly as white mice, and are not confined to any particular climate. It is rather remarkable that this use of the hair has not been thought of before, particularly when we consider how many hundred million rabbits are annually destroyed. The meat of the rabbit is agreeable and nourishing, and the skins have long been prized. The *Austrian Gazette* anticipates that an important industry will grow out of the successful introduction of rabbit hair weaving in all countries.

Ship-building.—In Maine there is more demand for ship timber than there has been for years, and a capitalist whose interests are directly connected with shipbuilding gives it as his opinion that next year there will be a general revival of shipbuilding in New England.

The Diamond as a Cutting Instrument.

It is noticeable that the diamond as a cutting instrument makes but little headway outside of America. The diamond drill is hardly a subject of experiment in Europe. But here we have proved its value, while we are talking about its results being "still doubtful."

One of the most promising applications of this novel cutting instrument is its introduction for the sawing of stone. A machine for this purpose has been constructed as follows: A broad blade of steel has, at certain intervals, pieces of soft steel placed in its edge, and projecting say three-eighths of an inch. These contain black diamonds, usually three to each holder. As the saw is drawn over the surface of the stone the diamonds make a deep cut, but in the return stroke they are lifted clear of the stone. By this method the cuttings are all drawn gradually to one end, instead of being shoved back and fourth in the cut. The machine does beautiful work. It leaves the surfaces free from saw marks and ready for the polishing stone. The edges are unbroken, and the stone if for building purposes, is ready to set without further preparation. Specimens of its work in all kinds of stone are exhibited, with the time of sawing marked on them. they are indeed admirable pieces of work.

This new use of the diamond is one that appears to have a bright future before it, and its successful introduction in America promises to afford us facilities that may be of the greatest service in encouraging the increased employment of stone as a building material.

An Experiment With Paper Car Wheels The Connecticut River Railroad Company is about introducing, for trial, a set of paper car wheels under the forward truck of one of its engines. These wheels have been known to car-builders for some time, but the demand for them has been moderate on account of their cost, notwithstanding the universally admitted fact that they are safe and easy going. The wheels are manufactured by bringing a pressure of 350 tons upon sheets of common straw paper, which forms them into a compact mass, which is then turned perfectly round and the hub forced into a hole in the center, this requiring a pressure of 25 tons weight. The tire is of steel, and has a one-quarter inch bevel upon its inner edge, thus allowing the paper rolling to be forced in, 250 tons pressure being required in the process. Two iron plates, one upon each side of the paper, are bolted together, which prevents the possibility of the fillings coming out. The tire rests upon the paper only, and partakes of its elasticity in consequence. Although these wheels are much more expensive than those in common use, the patentee claims that they are cheaper in the end, as they wear longer, injure the track less, and run with less noise than wheels of any other pattern.

Machinery for Corn-cutting.—It is remarkable that, with all the inventions of an agricultural nature, there should be nothing in relation to cutting corn. The millions of acres in the United States have still to be cut down by the old corn-knife made out of a piece of old scythe, just as it was cut a hundred years ago; and it all has to be gathered and shocked by hand in the same manner it was in the olden time. Yet it seems as if something might easily be devised. Certainly a machine can be readily adapted to cutting it; but the shocking by machinery could not perhaps be as well done. Still, American genius ought to be equal to the accomplishment of such a machine to perfection; and, only that it has not yet been done, we might hazard a guess that at some future time some one will succeed in doing so.—*Am. Artisan.*

Cutting up Whales by Steam.—The whaling bark Java, of New Bedford, is provided with an upright five horse power engine, to be used in cutting in whales and discharging cargo, hoisting topsails, if required, etc. This must prove a great saving of time and labor, as it usually requires 15 or 16 men to cut in a whale, while, with the help of the engine, six men can easily attend to it. The engine is stationed in the forecastle, occupying a space ten feet by four feet. It will be the first ever carried to sea in a whaler for these purposes. The idea originated with the first officer of the Java, Mr. E. T. Fish, of Falmouth, Mass.

Ornamental Crockery. — A gentleman in New Haven, Conn., has invented a machine for printing in colored and gilt enamels on china and pottery of all kinds which, it is claimed, will revolutionize the whole business of ornamenting crockery, reducing the cost to a small fraction of what it now is. He has applied for patents in several foreign countries as well as in the United States.

Narrow Gauge in Russia—The Fairlie narrow-gauge system in Russia has met with complete success. The Emperor has forwarded to the inventor a bronze medal, in recognition of the value of his engines, which have been placed on the Livny Railroad.

Mr. Bessemer's new anti-sea-sick arrangement has been tried with great satisfaction. Though the vessel rolled, the saloon was as quiet and soothing as a country church on a summer day.

Heavy Bars.—An English firm is rolling iron bars of the enormous weight of 540 pounds per yard of the special quality used in the manufacture of Armstrong guns.

Stock Sales for Week Ending Nov. 28—S. F. Stock & Ex. Board.

S. F. Stock and Exchange Board.

THURSDAY, November 28, 1872.

Mining stocks bave, this week, been in light demand, and very little business has been done. To-day being Thanksgiving day, there was no session of the Stock Board. There are few orders in the markst, and prices have ruled low. The stringency of the money market, the large nnmber of assessments, and the few dividends have depressed values and restricted business. Assessments havs been unusnally frequent in the last few months and dividends unusually few. The following assessments have been levied during ths month of November by miuing companies: Alamo, Washoe, 25 cents; Arkansas, Ely Dist., 50 cents; Atlantic & Pacific Cons. Cal., 10 cents; Baltimore Cons. Washos, 50 cents; Calaveras, Cal., 25 csnts; Caledouia, Washoe, $3; Golden Rule, Cal., 50 cents; Great Blue Gravel, Cal., 10 cents; Hndson, Cal., 7⅛ csnts; Hermes, Ely District, $1; Huhn & Hunt, Ely District, $1; Harper, Ely District, 10 cents; Julia, Washoe, $2.50; Lander Cons. Enreka, Nev., 10 cents; Mammotb Blue Gravel, Cal., 8 cents; Mammoth, White Pine, 10 cents; Mina Rica, Cal., 30 cents; McMahon, Schell Creek, 25 cents; Minnesota, Idaho, 50 cents; "420" Washoe, $1; New York Cons., Washoe, 25 cents; Norman, Cal., 5 cents; National, Nye Co., Nev. 50 cents; Old Providence, Cal., 25 cents; Pioche, Ely District, $1; Phœuix, Enreka District, 50 csnts; Piermont M. & M. Co., Nev., 50 csnts; Pacific Borax, Nevada, 35 cents; Placer, Cal., 20 cents; Rising Star, Eureka District, Cal., 15 cents; Savage, Washoe, $10; Sanderson, Cal., 12½ cents; Schsll Creek, Schsll Crsek District, 10 cents; Star Cons., Eureka District, 25 cents; U. S. Grant, Cal., 50 cents; Utah, Washoe, $1; Wellington, Utah, 10 cents; War Eagle, Idaho, $2; Washington & Creole, Ely District, 50 cents; Ward Beecher Cons., White Pine, $1.

Assessments delinqent this month are as follows: Bsllsvue, $6,000; Eliza, $5,000; El Dorado, $3,000; Empire Mill, $50,000; Greenville, $15,000; Gould & Curry, $96,000; Hale & Norcross, $80,000; Howard Hill, $25,000; Imperial, $100,000; Justice, $21,000; Knickerbocker, $24,000; Kentucky, $15,000; Lemon Mill, $20,000; Noonday, $4,000 Ophir, $84,000; O. H. Treasure, $32,000; Overman, $64,000; Peter Walter, $4,000; Peavine, $75,000; Pictou, $5,000. This makes a total of $650,500, the largest amount in one month for some time. The *Bulletin* has compiled tbe following comparative monthly statement which shows very clearly the state of affairs for the past few months:

	Assessments. No.	Assessments. Amount.	Dividends. No.	Dividends. Amount.
May	11	$351,750	5	$1,067,000
June	15	220,850	5	882,000
July	15	278,700	4	852,000
August	9	234,800	5	587,000
September	18	337,900	2	222 000
October	24	584,550	1	210 000
November	21	670,500	2	213,100
Totals	113	$2,679,110	241	[$4,303,100

We must maks a better showing than this if we expect mining to be considered as a favorable means of investment.

Below will be fouud news from the prominent mines later than that in our "Mining Summary."

CHOLLAR POTOSI.—For week ending Nov. 23d, 888 tons of ore were extracted of an averags assay value of $32.40 per ton; 918 tons ssnt to mill.

HALE & NORCROSS.—For week ending Nov. 23d, 1,049 tons of ore were extracted, 886 tons sent to mill, and 1,478 tons remaining on the dnmps.

SAVAGE.—For week ending Nov. 23d, 1,020 tons of ore were extracted of an average assay value of $26.35 per ton; 900 tons were delivered at the mill; and 164 tons remained on dumps.

RAYMOND & ELY.—On the 23d $36,636 was shipped, which addsd to prsvious shipments, makes $230,828 for 21 days, or $10,991.80 per day.

PHŒNIX.—On the 18th $3,947 was shipped; on the 20th, $5,857; on the 23d, $5,697.

EUREKA.—Last wseklj clean up with 10 stamps was 1,700 ounces of amalgam.

From the AMADOR TUNNEL mine, $4,350 has been received. Last shipmeut from tbs MAHOOANY was $5,607.32. Four bars of bullion were shipped from ths SILVER PEAK on the 23d, and ten on the 26th. From the WOODVILLE $4,558.42—proceeds of 100 tons—has been received. From the CEDERBURG, 280 ounces of bnllion was received on the 26th inst. This mine has declared a second dividend, payable on the 30th inst.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

TARSHISH.—Monitor *Miner*, Nov. 16: Col. Moore has come upon a 4 ft. vein from whicb Mr. Henry took average samples, assaying over $150 per ton.

SILVER GLANCE drift is running in the casing rock alongside the vein for the sonth chimney. Good indications ars struck daily.

AMADOR COUNTY.

BACON.—Jackson *Dispatch*, Nov. 13: The sbaft is down about 85 ft., at wbich deptb tbey have a 6 ft. ledge of fins looking ore. A fine whim is being erected.

SOUTH KEYSTONE.—The work of opening and developing the mine will be commenced witbout delay.

CALAVERAS COUNTY.

CAMPO SECO.—San Andreas *Citizen*, Nov. 23: The Spencer is prospecting well, a large vein, free gold occasionally visible to the eys. Shaft down 100 ft.

The Sims' tunnel is in about 150 ft.

EL DORADO.—The Madrid shaft is down 165 ft. and a level is being run on the vein, which is 12 ft. wids in the bottom of the drift. There is about 350 tons of rock ready for crushing which assays from $300 to $800, and the sulphurets assay $400, but the rock yields by mill process only $10 per ton.

LLOYD'S.—There is a breast of 70 ft. wids and near 3 ft. desp, which pays exceedingly well.

SCIEFFARD. — At 90 ft. from tbe top they are running a drift across tbe lead to sse how wide it is. Their drift is in 10 ft;, and thsy expect to go 5 or 6 ft. further bsfore reaching foot wall.

WOLVERINE.—Calaveras *Chronicle*, Nov. 23: Rock of unprecedented richness was struck one day last week. At 230 ft. the ledgs has widened out to about 4 ft., and not a piecs of quartz can be found tbat does not show fres gold.

PETTICOAT.—Ths shaft is down 450 ft. and sinking has been discontinued. Levels are being run from the bottom of the shaft both north and south.

HUDSON.—The new machinery was started up Friday of last week. Anotber ledge has recently been discovered near the Hudson that prospscts largely.

MOSQUITO DIST.—The Grasshopper has been stopped for ths present.

Sbaft No. 2 of the Dolly Varden is down 70 ft. Veiu 5 ft. wide and ore improving.

Tbe Cnba shows a vein of 4 ft. in width at 12 ft., with a streak of pay ore 16 inches thick.

In the upper tunnel of the San Bruno preparations ars beiug made for stoping. The lower tunnel is being run in search of a vein. Nsw discoveries are of daily occurrence.

KERN COUNTY.

ECLIPSE. — Havilah *Miner*, Nov. 16 : Tbe Eclipse, at White River, has a large dump of assorted rock, valued at $400 per ton.

BIG DUMP.—The St. John has about 290 tons of $38-rock on dump.

Tbs Bacchus mads a favorable clean-up last week.

CLEAN-UP.—A clean-up of 29 tons of quartz from tbe Jnpiter returned $878.

BIG BLUE MINE.—A clean-up of 60 tons of rock, last week, rsturned a littls over $4,000.

NEVADA COUNTY.

EUREKA.—G. V. *Union*, Nov. 24: The Eureka had a clean-up yesterday, after a run of six days, witb 10 stamps, and tbe amalgam produced amounted to 1,700 ounces, or $12,000.

IDAHO.—The Idaho new machinsry has been running for 2 weeks. Yesterday tbere were bars of gold valued at over $22,000 brought in, the product of the run.

WYOMING.—Ths owners propose to put up hoisting works, erect a mill and to opeu the mine in a most thorough manner. A devslopment made in ths west drift shows splendid-looking ore and very rich sulphurets. There ars about 300 tons of fine milling ore on dump. The rock pays about $30 per ton.

RISING STAR.—Nsvada *Transcript*, Nov. 23: Thsy bave struck a rich body of ors, showing free gold and rich sulphurets.

THAT RICH LEDGE.—Ws have published ssveral items in rsgard to the ricb discovery ou Wood's ravine. The last crnshing a few days ago netted about $50 per ton, and the snlphurets assay $204 per ton. The ledge is bstween 3 and 4 ft. in tbickness, and they are down ou it about 50 ft. There is a seam running through ths entire ledge, so far as it has been opened of between 3 and 4 incbes which is "lousy" witb gold.

MOHAWK.—The shaft is down 75 ft., and is being sunk at tbe rate of about 3 ft. psr day.

COPPER.—Marysville *Defender*, Nov. 19: The coppsr mines near Spencsville are being workd. Smelting furnaces will be erected, and tbe ledgss fairly tssted.

SIERRA COUNTY.

Rich.—Downieville *Messenger*, Nov. 19: The Bald Claim, Forest City, is reported richer than ever.

Got the Ledge.—The Oro owners have tapped the ledge in two places, several hundred feet apart, and at considerable depth. It prospects well in both places.

Oak.—Truckee *Republican*, Nov. 19: W. R. Litchfield, presented us yesterday with some very fine specimens of silver and copper ore from the Bullion, Antelope Neck. The Bullion has been opened by a shaft to the depth of 75 ft. The ore assays 20 per ct. of copper, and about $60 in silver per ton.

SISKIYOU COUNTY.

Prospecting.—Yreka *Union*, Nov. 16: There has been considerable prospecting in the eastern part of this county; and there are several persons still engaged.

Humbug.—On Lawson Gulch, P. McGarvey has done well, as also a Chinese Co.

A China Co. below Riverville, have done very well.

D. N. Lash and S. H. Crary are running a tunnel into the old Sebastapool claim.

Lash & Lecty are making good pay on the main stream, below the Forks.

White & Co. are averaging $100 per week to each partner above expenses.

TUOLUMNE COUNTY.

Strike.—Sonora *Independent*, Nov. 20: N. Banle & P. Banle struck a rich pocket in the Bald Mountain lode and took out 18 lbs. of gold mixed with very little rock. The vein averages about 6 inches in thickness.

Another Strike.—Sonora *Democrat*, Nov. 22: A Rocco and Co. struck very rich gold-bearing rock last week, in a quartz vein in the Deer Flat hill.

Nevada.

EUREKA DISTRICT.

Strike.—Eureka *Sentinel*, Nov. 23: Another large body of fine ore has been developed within the last day or two in the Phenix.

Seaton.—A shaft has been sunk 17 ft., and at the bottom shows a well defined vein of ore about 2½ ft. in width. Active operations will be commenced within a few days. The Springfield, owned by the same parties, is only a short distance from it. A shaft has been sunk 30 ft. and the indications are very encouraging.

Starten Up.—The works of the Ruby Con. Co. started up on Friday. The furnace seems to work perfectly, and bullion was turned out yesterday.

ELY DISTRICT.

Bullion.—Ely *Record*, Nov. 17: Shipments for the past week were $110,844.38.

Silver Peak.—The main shaft is down 120 ft. On the 90-ft. level drifts running both east and west have proven the ledge to be well defined and from 3 to 9 ft. wide, with an average of 4 ft. of pay ore. They are taking out from 12 to 15 tons per day, which will mill at least $100.

Portland East Ex.—The shaft has reached 60 ft. in depth, and the vein is fully defined. Assays were taken which run from $125 to $150 to the ton. It is probable that within 30 days an immense body of ore will be struck.

Chapman.—Hoisting works will be erected soon. Arrangements have been made with the American Flag mill to work 500 tons of ore. There is on dump about 160 tons. The force of men will be increased in the stopes next week, and the ore extracted from the upper levels. The ledge cut at the 160-ft. level is improving.

Assaying.—T. R. Butler, during the past week, has been steadily at work melting and refining bullion from the Pioche and Condor mills. Thirteen bars from the Pioche averages about 900 and that from the Condor 800.

Ivanhoe.—Drifting east and west on the vein. At a depth of 200 ft., considerable ore is being hoisted and is found to be first-class. Assays made yesterday showed $575 to the ton.

Newark.—About 3 tons of first-class ore is raised daily. The winze in the west drift, first level, is looking well and improves with depth. The main shaft has reached 97 ft. below the first level. On Monday a drift will be started south to cut the ledge.

Marion.—The sinking has reached 100 ft. The stopes in the drift are looking well; 3 tons of ore from the stope have been placed on dump in the last two days.

Floral Mill.—The work is being pushed forward rapidly, and the mill will be ready for operation on the 15th of next month.

Kentucky.—Is being worked vigorously.

Portland Co.—Working 4 shifts. The perpendicular shaft has reached 110 ft. Workmen are drifting from the main shaft, on the ledge, which is 5 ft. in width, and are taking out ore of a superior quality. About 70 tons of good pay ore are on dump.

Chief of the Hill.—Taking out 4 to 6 tons daily, which is being crushed at the Magnet Mill. The battery assays are higher than heretofore. Winzes Nos. 2 and 3 are down about 90 ft. Will commence shipping bullion in a day or two.

Baltic.—The contract of 100 ft. was completed on the 9th inst. The ledge looks well, carrying small bunches of good ore.

Pioche Champion.—Working 2 shifts. Down 140 ft. and looking remarkably well. Expect to strike pay ore soon.

Pacific Tunnel.—In 1,068 ft. Drifting 542 ft. and have struck rich ore.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Nov. 16: Amount shipped from the Arizona since our last issue, was $6,872.

Central.—Same paper, Nov. 13: The shaft on the Marietta is down 220 ft. The ledge in the bottom is 3 ft. wide, and carries ore of excellent quality. Work is being prosecuted on the Teamster. The Central mill was started up last Monday, on ore from the Potosi.

Roasting Furnace.—The Pioneer & Inskip Co. have contracted for the construction of a roasting furnace.

REESE RIVER.

Belmont.—Reese River *Reveille*, Nov. 16: The Monitor will start up about the 1st prox. The El Dorado Co.'s mill has all the foundations laid, the battery blocks set, smoke stack up, and the lower portions of the furnace well under way. This Co. is opening up its two mines in shape to keep its mill running steadily. Several large bodies of good ore are exposed in the 340-ft. level; splendid ore is being taken from the 240-ft. level of north incline; 400 ft. of level contract goes ahead fast. In the Arizona first class ore has been found 200 ft. north of the Monitor line. This Co. is working 70 men.

Monitor Co.—Will commence stoping out as soon as the ore is needed for the mill, the ore house and dump being already filled with assorted ore. Working 60 men.

Belmont Co.—Continuing its levels in Canfield under contracts with favorable prospects. Hoisting works nearly finished. Working 25 men.

Combination Co.—Taking out fine ore from the Translyvania. Working 25 men.

WASHOE.

Chollar-Potosi.—Gold Hill *News*, Nov. 23: Daily yield 165 tons, worth $29 per ton. Repairing the shaft is completed to the head of the incline. The incline will be put in good working order as fast as possible.

Con. Virginia.—The shaft is down 50 ft. below the 500-ft. level. Work has been resumed in the west drift of the 1167-ft. level from the Gould & Curry shaft. Erecting the new hoisting works progresses finely.

Imperial-Empire. — The foundation work for the new pumping machinery is approaching completion.

Belcher.—Daily yield 300 tons. The main incline is down 133 ft. below the 1100-ft. level. The 1200-ft. level shows better as further developed, and the ore breasts of the 1100 and 1000-ft. levels look and yield well.

Hale & Norcross.—Daily yield 140 tons. The main incline is down 337 ft. below the 1500-ft. level. The work of sinking a winze from the 1500-ft. level to connect with and ventilate the 1700-ft. level is commenced.

Silver Hill.—The north drift at the first station is following the ore vein, which is 7 ft. wide and of moderate grade. In the south drift, first station, the ore body is 5½ ft. wide, assays of which average $13 per ton. The raise to connect with the winze from the old upper tunnel is 23 ft. above the level of the first station, at which point the ore body is 12 ft. in width and of good quality. In the winze below the old tunnel level the ore continues of an excellent quality and the width of the body is unknown.

Schell Creek.—Schell Creek *Prospect*, Nov. 16: The McMahon is looking better. The shaft is down 110 ft. from the croppings, the bottom of it looking exceedingly well, the ore vein being 3 or 4 ft. in width. The intention of the Co. is to sink the shaft 170 ft. to connect with the tunnel. The tunnel is in some 140 ft. showing considerable vein matter. The Jupiter is worked to good advantage, a marked change for the better having taken place within the last few days. The Kavanagh tunnel is in about 115 ft. in a granite and quartz formation, and is improving in appearance daily. The mines of Queen Springs, Centreville, and Ruby Hill are looking their best, but little or no work is being done on them owing to the cold weather. Work on the Tehama mill has been temporarily stopped.

Savage.—Daily yield 150 tons worth $28 per ton. The incline is down 49 ft. below the 1,600-ft. level in good sinking ground. Both the main north and south drifts on the 1,600-ft. level are being driven vigorously ahead.

Caledonia.—Work on the 400-ft. level progresses with the exception that a new drift, running northward, has been started on that level.

Succor.—Shaft down 215 ft. Rock hard.

Crown Point.—The 1,300-ft. level developments showing better than last week, and the ore breasts in the other levels yielding splendidly.

Globe.—The main west tunnel is pushed vigorously ahead. A raise has been commenced from the tunnel level in the ore body already penetrated.

Baltimore Cons.—Shaft down 320 ft. The drift at the 250-ft. level is in 80 ft. from the shaft.

Julia.—Fair progress is made in sinking the shaft. The main east drift is in 307 ft. in low grade ore.

Insurance.—The incline is down 40 ft. below the tunnel level, in ore that assays from $8 to $23 per ton.

Yellow Jacket.—Drifting and cross-cutting at the 1,300-ft. level. Drifting east for the ledge at the 1,400 and 1,500-ft. levels is progressing.

Overman.—Work on the new machinery goes steadily on.

Knickerbocker.—The main west drift is in 352 ft., the face in blasting porphyry with occasional streaks of clay and quartz.

Senator.—The shaft is down 297 ft. in barren quartz. Good progress has been made during the week.

Buckeye—Turning out an unusual amount of good ore.

Woodville.—Everything working finely.

WHITE PINE.

Eberhardt & Aurora Co.'s Mines.—White Pine *News*, Nov. 16: The Eberhardt, Blue Belle and Attwood shafts have connected at the lower level, and sinking for better ventilation. The DePass and Ridsdale chambers are full of broken-down rock. Prosecuting the drift from the bottom of the North Risdale chambers to the north. The central shaft is down 160 ft. Running a drift from the Lady's chamber south to connect with the central shaft.

Beecher Cons.—The mine has shut down temporarily.

O. H. Treasure.—The various workings are looking well; considerable dead work is being done with fair indications. The Wheeler tunnel is being pushed ahead in spar and vein matter, which is dipping downward.

Sunbeam.—Sinking in the Moscow shaft, and running a little to the south in quartz and black spar. The mine shows some improvement.

Mammoth.—The bottom of the shaft is looking well, and down about 65 ft. in good ore.

Silver Plate.—Running in the tunnel, which is over 60 ft. deep, and in good ore.

Noonday.—Struck rich ore in the crosscut of the lower level. Penetrated the ore body 4 ft. and found good ore still ahead. Average of several assays above $200 per ton.

East Sheboygan.—Prospecting and forming connection with the south drift, with good indications of striking ore.

Copper Glance.—Breasting ore from the northwest drift.

Outside Dists.—Muncy Creek.—The Muncy Creek Cons. Co. will start up work on their mines about the 20th inst. The Co. is down on one of their claims 33 ft., in carbonate ore, and in another a tunnel of 30 ft. has been run in the same mineral.

Ruby Hill.—A body of rich ore has been struck in the Lookout.

Hunter.—The owners of some of the principal mines are about to start up work on their property.

Arizona.

Items.—Prescott *Miner*, Nov. 9: A. B. Smith, of Lynx Creek, says water was very scarce when he left.

In the past 18 months, one miner has taken out, with his rocker, nearly $5,000 in gold.

The miners of Mohave and Yuma Counties are shipping a great deal of gold, silver and copper ores, to S. F.

Montana.

Spokane Bar. Helena *Herald*, Nov. 14: Mr. Stewart last week cleaned up $1,135. of fine gold dust from his claim and his summers's work has netted him over $3,000.

Phillipsburg.—The 5-stamp mill of the Imperial Co. is pounding out the Silver bullion very successfully.

Items.—Virginia *Montanian*, Nov. 14: A lot of magnificent ore came in on Saturday from the lead owned by Word, Morris & Co., Silver Shower Dist. The recent development has discovered a solid vein of first-class ore fully 3 ft. thick, which pays $300 per ton.

The Messrs. Covely, at Summit, are taking out a splendid quality of rock. The test run on their ledge, from 20 ft. development, runs over $24 per ton.

The Cork Co. have been cleaning up for the past two months, with a daily average of $30 per day to the hand.

Idaho.

Rich.—Idaho *Statesman*, Nov. 16: Gov. Bennett and others, mining on Republican river, struck it very rich last week. Several spots panned out from $50 to $500 to the pan.

Ina Ellmore.—Silver City *Avalanche*, Nov. 16: High grade ore continues to be raised from the 7th and 8th levels. The ore house and all the ore chutes are full of ore. To-morrow they will resume hauling ore to mill. The main shaft is down 60 ft. for the 9th level, and the winze, 66 ft. north of the shaft is down 52 ft. below the 8th level in fine looking ore.

Minnesota.—The shaft is down nearly 400 ft.—about 80 ft. below the fourth level. The ledge has gone to the east of the shaft for the last 20 or 30 ft. The 4th level drift south and the south winze are connected; they have commenced stoping from the winze each way, and will soon be taking out from 10 to 15 tons of ore a day that will mill $35 to $40.

Red Jacket.—The large adit level is going ahead rapidly, and the face of the drift is in fair pay ore.

South Chariot—The shaft is down 15 ft. for the 7th level, and the 3d and 6th level drifts north will be started next week.

Empire.—The 1st, 2d and 3d levels are being driven north into the hill, which gives about 300 ft. of backs on the north side of the shaft and about 200 ft. on the south. The 2d level drift south is in 140 odd ft. to the south winze. On the north side of the shaft, underhand stoping is going on at a rapid rate. The 2d level drift is in north about 160 ft., making the entire distance of that level on the vein, 300 ft. The 3d level drifts are fairly started. Underhand stoping has been commenced on each side of the shaft below the 2d level. The shaft is down 30 feet below the 3d level, with good sinking and going down at the rate of 10 ft. per week. The Owyhee Co's mill is running 20-stamps on Empire ore, of which three are between 300 and 400 tons on the mill-yard, 200 in the ore house, and 150 broken down in the mine; 75 men are employed.

Mahoany.—They have struck it in the 6th level, 113 ft. south. The ledge is 18 inches wide, and the richest ore that we have seen in camp for many a day.

Golden Chariot.—The 4th level south is in 160 ft., from which point a winze has been sunk to the 5th level, where they are stoping in the true vein. There are 20 men at work stoping in the 5th level, where the vein looks well for 200 ft. They have struck rich ore in the bottom of the 6th level drift 210 ft. south of the shaft, at which point 10 men are stoping. The 9th level south drift is in 62 ft., and the vein continues to look well. From 15 to 20 tons a day are being raised from the 5th and 6th levels; 10 stamps of the Ellmore mill are running on Chariot ore.

War Eagle.—Will commence hauling ore to the Owyhee mill to-morrow for another crushing.

Utah.

American Fork.—S. L. *Tribune*, Nov. 19: The Wild Dutchman consists of a vein of argentiferous galena and chlorides about 3 ft. in width between the wall-rocks, which are composed of limestone. This mine has on hand about 250 tons, assaying on an average $200 in silver.

The Miller ore produces bullion about $100 in silver and $10 to $28 in gold, with a small per cent. of copper.

The Alta consists of a vein of argentiferous ore containing grey carbonates, and yellow and green chlorides. It is 4 ft. between well defined wall rocks consisting of a dark limestone. The discovery shaft has been worked but a few feet in depth. A tunnel has been opened on the vein and worked 60 ft. About 15 tons of ore has been taken from this tunnel assaying from $100 to $400 silver per ton and 35 per cent lead.

Little Cottonwood.—S. L. *Journal*, Nov. 16: In the Grizzly the vein is about 18 ft. in width, and shows a body of good ore throughout. The Victoria tunnel is in about 200 ft.

California Trout.

The most delicious fish we have on this coast are our trout, and very few streams will be found without them. In localities within reasonable distances of the city, they afford great amusement for amateur Isaac Waltons, and further off the Indians depend upon them for a portion of their subsistence, and ranchmen vary their diet of bacon and beans, or mutton, with an occasional dish of trout. The abundance of these fish in most streams is, however, no excuse for parties to slaughter them wholesale by the use of Giant Powder, or with seines. The former method was extensively practiced until forbidden by law. Large charges of Giant Powder were placed in a favorable spot in a creed and then exploded. The concussion caused the fish to come to the surface, where they were captured in large quantities.

The use of seines is almost as bad as this, and more especially when used in breeding seasons. The law forbids the catching of trout during certain seasons, varying in different counties of the State, and we believe, expressly prohibits the use of seines in any instance; nevertheless this rule is frequently broken. We know of an instance where a gentleman in Marin County, after stocking a creek on his private property with fish, at considerable expense, found to his chagrin that an enterprising Frenchman had taken advantage of his temporary absence, and had captured nearly all the fish in the stream by means of nets. If this practice is allowed to continue, it will result in a total extermination of our brook trout, much to the sorrow of legitimate sportsmen.

The Fish Commissioners have been very active in endeavoring to suppress all of these nefarious practices, and we hope they will continue to do so. A contemporary mentions an instance of wholesale destruction, which only occurred last week, in which a two-horse wagon load of salmon trout were caught in Pescadero Creek, with a seine. That particular locality is one that should be especially guarded, since its close proximity to the city renders it a favorite resort for sportsmen in the summer. It would be well to see that all such creeks as Purissima, San Gregorio, Pescadero, Butano, White House, Waddel's, Scott's, San Lorenzo and others on the Coast, with which sportsmen are familiar, should have some sort of supervision from residents near them, to prevent similar depredations occurring there.

The trouble taken by many gentlemen in this State in pisciculture will be more than counterbalanced by a few dozen men with nets; and while some are endeavoring to stock new creeks with fish, others will be emptying the inhabited ones by means unbecoming sportsmen. There are so many people who delight in angling that it is a pity that their sport should be stopped to satisfy the pecuniary desires of a few "pot-hunters." If every farmer who lives near a creek which contains these finny beauties, were to keep an eye on the people who they see in the neighborhood, and would report to the Fish Commissioners any violation of the law, these offences would be much less frequent.

Miscellaneous.

Mining Operations in Lower California.

A correspondent of the *Alta* writes as follows from San Diego, under date of November 14th:

Since the discovery of placer diggings, which was made in 1870, by Ambrosio del Castillo, in the Valley of San Rafael, in Lower California, about 90 miles south of San Diego, several veins of quartz have been discovered in the same district. They are generally found rich in gold, with an additional percentage of silver as the developments become deeper.

Among these veins those best known are

The Trinidad and San Nicholas.

The first was discovered by parties in the interest of Castillo & Co. Notwithstanding it has been poorly worked, the proprietors have profited by a good yield of the precious metal. The want of machinery is the cause of slow progress. Until about four months ago this mine has been what is called a pocket mine (*mina bolsera.*) It was found generally that the vein was only two or three inches in width, while at irregular intervals of distance they encountered pockets so rich in metal that in the space of five or six feet they have yielded from ten to twelve thousand dollars. Since then the vein has been constantly widening as work progressed, so that now—at a depth of ninety feet—it has a width of three feet. The ores extracted now are yielding seventy-five dollars to the ton. The proprietors are negotiating with San Francisco parties for a ten-stamp mill, to be erected at the mine. They are to give a one-third interest in the mine for such increased facilities for working.

The San Nicholas is also reported to be very rich. It was discovered by Enrique Leon & Co. It is the only mine in the valley which has a mill of ten stamps. The weekly product in gold at present is reported to be from $2,000 to $2,500.

The other veins which have been up to the present time discovered in this district—among which are La del Pueblo, La Amistad, La de Zapata, and others, the names of which are forgotten by the writer—are believed to be rich, but they have not yet been sufficiently developed to determine their value.

The Real del Castillo.

This mining district, which is situated at one end of the beautiful Valley of San Rafael, is named "Real del Castillo," after the discoverer. There is water and wood (oak, willow, sycamore, etc.,) in the immediate vicinity. Some of the miners complain that the local provincial or territorial authorities do not stimulate or encourage the work of prospecting and developing the riches of the country, but discriminate between the people coming there, and check immigration.

A resident mine owner, writing in Spanish to your correspondent, says:—"Since the administration of the Sub-Prefect, Manuel C. Rojo, who now rules La Frontera, a righteous administration of justice has not been known. There is no government there based on laws; there is no other will but that of his supreme absolutism, supported by his ready tools, the Justices of the Peace and the Town Council (Ayuntamiento). In consequence thereof many worthy and industrious citizens have been compelled to leave the country, fleeing before the acts of these authorities, and abandoning their interests in fear of assassination—that is to say, they persecute the worthy man and protect the bad man."

Fortunately for the inhabitants of this district, the Governor of the Territory, who resides at La Paz, (Capital of Lower California,) listening to the many complaints which have been preferred against the Sub-Prefect, has named already another to take his place. He is expected to arrive by the next steamer from the coast of Mexico. If this be true, there is not the least doubt but that this section of Lower California will receive a large immigration within a few months, instead of having, as at present, only about four hundred inhabitants; because then, in place of being ruled by a demoralizing authority, which combines every class of vicious men, they will be governed by the young man, Coronel Jose Maria Villagrana, which, according to reliable information, is the name of the one who is to relieve Rojo.

This Coronel Villagrana is one of the most talented men of La Paz, and was formerly the Secretary of the Governor of that capital; and I do not doubt but that the Frontera will progress very rapidly under the Administration of so distinguished a Mexican, inasmuch as I have already indicated that that beautiful and rich country, in order to be prosperous, needs only an authority that will cause the law to be respected, giving guarantees to all its inhabitants.

Interesting Mineral Land Decision.

As the question whether land is mineral or agricultural is one of great importance and frequently arising, we give below the opinion of the Register and Receiver of the Sacramento Land Office in the contested case of Blakely, mineral applicant, vs. Johnson, agricultural claimant. The Register and Receiver, after reciting the record facts, proceed as follows:

The evidence shows that Johnson, the agricultural claimant, settled upon the land in contest in the year A. D. 1849, and has lived upon it and made his home ever since—rearing upon it a family of children.

Blakely, the mineral claimant, and his grantors, went into possession of a small part of the disputed premises in September, 1867, under a contract with said Johnson, who was then in possession, by the terms of which the possession was to revert to Johnson after the expiration of four years and nine months from the 20th day of September, 1867.

Johnson has valuable improvements on the land, is a *bona fide* settler and has been since 1849, and filed on the land in time.

It is insisted by counsel for the mineral claimant that the only question to be decided in this proceeding is whether the land in contest should be treated as mineral or agricultural. We will therefore examine the question first.

The present case differs from most of the cases tried in this office which involves the character of the land. As the general rule in that class of cases, the land claimed to be agricultural is the common red land of the mountain slopes of the Sierra Nevada. Such land is very valuable for the cultivation of the vine—a branch of agriculture yet in its infancy—and of fruits of almost every variety. With little manuring, and such cultivation as lands in the Eastern States receive, it would successfully grow nearly all the grains and vegetables. It is generally believed by those best acquainted with this subject, that in a few years the most thrifty farmers in the State will be found on this character of land. Still such land could not with propriety be called rich and fertile. It could not be classed with the first quality of agricultural lands. The soil is light, and exhaustive crops would soon make manuring necessary.

It is in the kind of land above described that gold mines are generally found or claimed. It overlies gravel hills and ledges of quartz; and as the general estimate of its agricultural value has been very low, and as there is a good deal of such land, the fact that it contains good mines which will pay ordinary days' wages by extensive working, has been deemed sufficient warrant for its destruction by mining processes. This rule of decision has perhaps been carried too far in view of a wise consideration of the future; but under the law and the decisions such land must be held mineral, when it can be mined with any profit whatever.

The land in contest in this case, however, differs very materially from the class of land described. That portion of it which is claimed to be mineral is rich bottom land, such as is seldom found in the Sierra Nevadas. It is natural meadow land, with a rich black soil several feet in depth. Such land is very valuable for agricultural purposes in that region of country—much more valuable than it would be where such land is common. It will grow in large quantities almost all kinds of agricultural products at a locality where such products command the highest price. Evidently, therefore, this land should not be considered more valuable for mineral than for agricultural purposes, unless it appears affirmatively that the washing away of such valuable soil by mining processes will pay a handsome profit. But upon a careful examination of the evidence we fail to see that the mining already done on this land has paid the expenses incurred in working it. The mineral claimant seems to have been sluicing off this rich soil with the vain hope of some time or other making it profitable. And yet he has worked out what is evidently the best part of the land for mining purposes. There is no probability that what remains will pay better than the part already worked. He had already sluiced off the centre or lowest part of this meadow, where the richest deposit of gold would naturally be. More clear profit could have been made from the agricultural products of the land annually, if it had been carefully farmed, than the evidence shows to have been received from mining it. The use of it for agricultural purposes would have left the land in its original condition, a source of continuous profit in the future; all of it that has been mined is practically destroyed. A true statement of the question is this: If the land was owned in fee simple by a man of good judgment, well acquainted with both mining and farming, and knowing all about the premises that is shown by the evidence, would he preserve it for agriculture, or destroy it by mining?

Geological Survey of the Yellowstone.

Outline of what has been Accomplished.

The U. S. Geological Surveying party of Dr. F. V. Hayden, has returned from their trip of exploration from the Yellowstone District, Gallatin, Madison and Snake River country.

One division of the party explored the first named district.

The second, and largest division, were to explore to hitherto unknown sources of the Snake River, its tributaries, together with its lakes and mountain ranges. Among the principal objects during their "trip of observation," was also the Teton range, situated on the west-ern bank of the Snake river, and near a large and most interesting lake known formerly, through indefinite maps and charts, as "Jackson's Lake."

The main observation of the Snake River Division commenced near Fort Hall, and proceeded northward to a point where the two great forks of the Snake river form a junction, namely: Henry's or North Fork of Snake river, and main Snake river. Thence they proceeded eastward for twenty miles to a place near the Crater Butte, two extinct volcanoes; followed the North Fork up to the junction with the Middle Fork; crossed and located on their route for 40 miles towards the east, over thirty streams of more or less magnitude, and reached (after exploring a good part of the Teton River Cañon,) the Teton range, where the Teton river emerges out of this most interesting, and in more than one respect, characteristic Mountain Range.

From there (after due observations) the party's march was directed northward to the upper waters of the Henry's Fork—which river has for its source a magnificent lake, surrounded by picturesque and commanding mountain ranges.

From there, the party proceeded through Targhis Pass into the Upper Madison Basin, and through Upper Madison Cañon into the Geyser or Fire Hole Basin.

Thorough observations, in all branches of science, were made at the latter place, which, in due course of time, will prove to be one of the most interesting spots on earth.

From there the party's attention was directed to the discovery of the main source of the Snake river.

In order to obtain this object, one branch of the expedition explored several Mountain Divides to the south and to the east, located on Shoshonee and Lewis Lakes properly, and discovered also the head-waters of the Middle Fork.

The main party proceeded after this, through a steep and high cañon, through which the outlet of Lewis Lake flows into the upper main Snake River Valley, while the topographer, with a small party of men, made a tour of over 150 miles, and visited all the principal sources of the East Snake River waters, together with their cañons and ranges, thereby obtaining information that will greatly improve our geographical knowledge of that part of the country.

Another large stream, with nine magnificent falls, was also discovered and followed up. It was found to be a tributary to the Middle Fork, situated at the northern extremity of the Teton Range.

The large stream known to the trappers by the name of "Buffalo Fork," was followed up by the surveying party for forty-five miles into almost impenetrable cañons. So were several other important side streams of this *terra incognita.*

The finishing part of the work was done in thoroughly examining the East Teton Basin, its grand and splendid Lake, the immense Mountain range of the Teton, with its narrow defiles, and its numerous Snowy Peaks.

The surveying party were finally compelled to force a passage through the two lower Snake River cañons, making a march of eighty miles in length. It took nine days of hard travel, while the main party proceeded through the so-called South Pass of the Teton Range.

The place of re-union was a camp near the mouth of the Lower Snake River cañon.

All camps during the whole trip were astronomically located, and both latitude and longitude taken, together with meterological observations. Botany and everything pertaining to the different branches of science, also received the most careful attention, and nothing was left undone that might promote the interests of science or aid in the development of the hitherto unexplored portions of our country.—*Ex.*

Iron Ore.—The Grass Valley *Union* says: The iron ore claims, located a few weeks ago by Messrs. A. H. Hagadorn and George K. Phillipa, is appearing exceedingly well. The claims are two or three miles east of Nevada city. Samples of the ore has been sent to San Francisco for working trial, and the ore proved to be 75 per cent. of iron of the best quality. A company to work the mine has been incorporated. The company will have plenty of capital, and its affairs will be managed by experienced men. How this county does need a narrow gauge railroad through its interior, so that its iron, copper, marble, lumber and other things can be sent to market.

Oregon Mines.—The quartz mines of Baker county, Oregon, are beginning to receive more attention than heretofore, and two new mills have been erected near Hogem, and one at Gem City, both of which are being worked with good results.

Mining Matters in Nevada County, Cal.

Mining prospects in this vicinity are most excellent, says the Nevada City *Transcript*, and a large number of men are employed in the several newly developed mines. The indications are that next Spring and Summer will be the most prosperous mining season, so far as quartz is concerned, that the county has ever known.

Nevada District.

In this district, during the past few months, a number of new mines have been worked and good ledges have been struck with pay rock. The Providence, Gold Tunnel, Nevada, Pennsylvania, the Murchis mine and several others which we do not now call to mind. The California, Gold Run or old Mohawk, Home and a number of others are being worked or about to be opened in this district. The forces employed in quartz mines has been largely increased by the working of these mines.

Eureka District.

The Eureka District, near Granvilla, is also looking well. The Rising Star, formerly the old Grizzly, is being prospected under the superintendence of Mr. Moran. They have a fine ledge 2,000 feet below the surface in the tunnel, which is from 2 to 7 feet wide and shows free gold all through it. The prospects of these mines are most excellent. The Erie, which was sold to an English company for $200,000 some time ago, is being fitted up in the most thorough manner. The heaviest kind of machinery is being put up, and in the Spring a systematic opening of the mine will commence. There are a large number of other ledges in the vicinity which show excellent prospects, and this, in time, will be a prosperous district.

Grizzly Ridge.

A company is being organized to again work the ledges on Grizzly Ridge near Columbia Hill. Several years ago these ledges were worked and some very rich rock was taken out, but litigation among owners and bad management in working prevented them from paying and for several years they have not been worked.

Grass Valley.

A marked improvement has occurred in the condition of the quartz mines in Grass Valley district in the last two months, and we learn that every man in that district who desires employment can now find it.

Photographers' Materials on this Coast.

In full accord with the remarkable progress of photography on this coast, is the increase in the manufacture and sale of photographers' materials at the establishment of John Taylor & Co., Nos. 512 to 518 Washington street. Four years ago this firm created a special department for the implements and accessories of photography, having at that time some $3,000 worth of goods on hand and in various stages of manufacture, and such has been the growth of the business that their stock now represents $40,000. It is interesting to learn that the competition of Eastern firms who sent out runners, and by other means endeavored to exterminate this California industry while it was yet in its infancy, met with a signal defeat at every turn, and they eventually allowed Taylor & Co., to have their own way. The manufacturing department is devoted to frame work. Here the charming rustic frames, so popular in the ornamentation of parlors, are wrought into graceful forms by skilled workmen, and the more ambitious gilt frames are also produced. In some instances, the leaves and vines and bits or branches of the frames are moulded in the East and received shaped and finished at the hands of the local workmen, and again the entire work is done here. Five men are at present employed in the manufactura and gilding of the frames, and as the demand increases the facilities for production will be improved. The local woods used are pine and redwood, and in gilding, Rodger's California gold leaf is utilized. The details of manufactura are not of sufficient interest to warrant an elaborate mention, and the materials in the sale department are pleasanter to view than to read about, and it is the value of the establishment as the champion of a local industry that warrants this reference in our columns.—*Bulletin.*

A Persevering Miner.—John R. Hite, the proprietor of the mine at Hite's Cove which bears his name, is in town this week, and brings the gratifying news of the completition of the tunnel which he has been running, night and day, for about five and a half years. It is about 1,400 feet in length, and through a very hard species of rock. The tunnel is about seven feet in height by about five in width, and taps the vein at a depth of 900 feet. They struck the the vein last week and find it as rich in gold, or perhaps richer, than it was near the surface. They have not yet gone through its entire thickness, but the indications are favorable for an immense body of very rich ore. They will work upward now in order to meet the shaft which is being sunk from a drift above for ventilation. The mine can now be classed as one of the most valuable in the state, or in the world.—*Ex.*

Useful Information.

Indian vs. Chinese Tea.—Indian tea is said, on the authority of a correspondent of the *London Grocer*, to possess nearly double the strength of the Chinese article, and it is principally used by tea merchants and grocers for mixing with China tea to give strength and flavor to the latter. Most of the China tea sold in the London market, brings from 25 to 37½ cts. per lb. exclusive of 12½ cts. duty, while scarcely a chest of Indian Congon sells as low as 37½ cts. Indian teas in the London market generally retail about 50 per cent. higher than similar grades of China teas. Moreover while adulterations are not uncommon in China, they are never known in India. Green teas are almost exclusively the product of China, and are never known in India, with the exception of a limited quantity manufactured at some of the tea plantations on the Himalayas, mostly sold to the traders from Turkestan and Thibet, and only the surplus is sent to Europe. It pays the tea planter to make his tea leaf into black tea rather than green. Tea drinkers who prefer green tea must therefore be content with the product of Chinese ingenuity, and be satisfied to drink the compound of tea, turmeric, Prussian blue, China clay, etc., prepared for the British "barbarians."

Blood and Lime Varnish.—The Chinese are said to make a varnish by heating together fresh blood with quick lime, which is extensively used as a coating for wooden articles which they wish to make completely water-tight. Von Scherzer, who first introduced this substance to the notice of Europeans, says he has seen in Pekin wooden chests that had been varnished with it, which after a journey over Siberia to St. Petersburg and back, were still sound and perfectly water-tight. Even baskets of straw, used for the transportion of oil, are made fit for the purpose by means of this varnish. Pasteboard coated with it becomes, both in appearance and firmness, like wood. Articles requiring to be absolutely impervious are varnished twice, or at most three times, by the Chinese. The preparation has been tested in various ways, both in Europe and Australia, and although it gives to vessels covered with it a rough, ugly red appearance, its use is recommended as a sure means of making wood impervious to water.—*Cabinet Maker.*

Food from the Sea.—Richard D. Cutts, Esq., in his elaborate report to Congress showing the catch, consumption, and value of food from the sea, estimates its yearly worth at $120,000,000 in Europe and the United States, including Japan. Valuing the fish at three cents per pound, it gives an amount of four billion pounds as the yearly yield of the sea of food for man. If we estimate the weight of neat cattle at 700 pounds each, and a pound of fish to be equal to a pound of meat, we have here as much food, all the uncostly growth of the ocean, as is equal to five and three-fourths millions of cattle. The smallest consummere of fish per head are Japan and Russia; the largest Newfoundland, Prince Edward Island, and Nova Scotia. The last named places are surrounded by water, and the fish are abundant at their doore and always in a condition for a meal. Norway takes the lead, and France and the United States follow in production.

Vinegar From Rhubarb.—Good vinegar cannot be made of rhubarb (pie-plant) juice. Acetic acid, which is the sour principle of vinegar, is formed from alcohol, which is made from sugar, which in its turn may be made from starch. The juice extracted from the stocks of rhubarb is almost, if not entirely, destitute of sugar or starch, and accordingly contains little or nothing from which vinegar can be made. It contains, however, several vegetable acids, that are healthful and have agreeable flavors, and on this account some people add the requisite amount of alcohol, sugar or molasses to do it, and ferment the mixture in one of the ways we lately described for making vinegar from cider. It is rather an expensive way of making vinegar, and the product is not on the whole superior.

A Perpetual Paste—Dissolve a teaspoonful of alum in a quart of warm water. When cold, stir in as much flour as will give it the consistency of thick cream, being particular to beat up all the lumps; stir in as much powdered resin as will lay on a dime, and throw in half a dozen cloves to give a pleasant odor. Have on the fire a tea-cup of boiling water, pour the flour mixture into it, stirring well at the time. In a very few minutes it will be of the consistency of mush. Pour it into an earthen or China vessel; let it cool; lay a cover on, and put in a cool place. When needed for use, take out a portion and soften it with warm water. Paste thus made will last twelve months. It is better than gum, as it does not gloss the paper, and can be written on.—*Journal Applied Chemistry.*

Preserving Fungi.—It sometimes becomes desirable to preserve specimens of fungi for future or more convenient examination. For such purpose the following mixture has been recommended: Sulphuric acid; 2 pints, water, 8 pints; mix and add creosote, 1 pint. Bottle the fungi in this and cork tightly. It is said to preserve them perfectly, without change of color. Fungi may be preserved by drying by bedding them in silver sand, gills upwards, in tin boxes, and placing them in a slow oven, even for two or three hours.

Industrial Progress in Russia. — Next to our own country, there is no nation in the world that gives evidence of such rapid progress in industrial matters as Russia. Her mechanical and metallurgical interests are almost daily developing, and new means of utilizing her great resources are constantly coming into existence. A gigantic establishment has been recently founded by MM. Sturve, Brothers, near the city of Kolom, which it is stated, rivals in magnitude the finest workshops of England or Belgium. It has been in operation but five years, and is at present engaged in the manufacture of iron bridges and railroad freight cars, though recently locomotives and passenger coaches have also been produced. At times, during the year just past, the works employed 4,000 hands. To give an idea of the importance of the establishment, we may add that since its foundation it has completed 3,000 cars; and since it has begun the manufacture, 79 locomotives have left its shops.

Loss of Weight in Freezing Wood.—A century ago Dathand showed that when wood is submitted to a degree of cold sufficient to freeze the water contained in its texture, the wood, on being thawed, had diminished considerably in weight. This he explained it on the hypothesis that the wood, in the contraction produced by the cold, had expelled a portion of the water contained in its tissues.

Hofmeister proved the loss of weight, but explained it on the theory that, in freezing, the fluids of the plant had surrendered their dissolved gases and thus diminished its weight.

Studying the phenomena of freezing under these conditions, M. Ed. Prillieux thinks that since the ice forms around the cells, the fluids contained in these organisms must pass outside of them, and consequently be more favorably exposed to the influence of evaporation, and the diminution of the weight he thus produced.

Artificial Magnets.—Tempered steel is used for the most part in making artificial magnets, and the harder the temper of the steel the greater is the strength or "coercive force" of the magnet. The horse-shoe form is very common on account of its convenience in experiments. The steel bar to be magnetized is laid on a table, and the pole of a powerful magnet is rubbed a few times upon the bar in the direction of its length, and always in the same direction. To magnetize steel in the form of a horse-shoe, a magnet of the same shape and nearly the same size should be used. This should be placed vertically on the magnet to be formed, and moved from the ends toward the bend, or in the opposite way, and brought round again on an arch to the starting point. A piece of soft iron as the armature should be provided and placed at the poles of the new magnet to act as the conservator of its magnetism.

Zinc Labels for Trees.—Buy a foot of sheet zinc, cut it in stripe one inch by two, or whatever size is desired, and if the name of the tree or plant is written on with ink made of the following ingredients, it will be indelible:

"Take of verdigris and salammoniac each two drachms, lamphlack one drachm, water four ounces, to be well mixed in a mortar, adding the water gradually. It must be kept in a glass stepped vial. Write on the zinc with the ink, after shaking it well, with a quill pen; and after it is dry you may expose it to the weather or bury it in the ground for years, and it will be as legible as when first written."

Strength of Gunpowder.—Would one grain of gun or blasting powder, in the middle of a cubic yard of copper, crack this mass of metal from its center if it could be fired so as to get all its force?

Ans.—Gunpowder, in burning, changes form, becomes gas, and requires many times the space it occupied while in the solid state. If it were possible to inclose a small quantity of powder in a large mass of solid metal and so ignite it that there would be no escape of gas, its explosive energy would either split open the metal or make room for the generated gas by enlarging the powder chamber. The experiment, however is an impracticable one.—*Ex.*

If a tallow candle be placed in a gun, and shot at the door, it will go through without sustaining any injury; and if a musket-ball be fired into water, it will not only rebound, but be flattened as if fired against a solid substance. A musket-ball may be fired through a pane of glass, making the hole the size of the ball, without cracking the glass; if the glass be suspended by a thread, it will make no difference, and the thread will not even vibrate.

"Deer tongue," a little plant that grows abundantly in the pine forests throughout the lower Southern States, is now attracting considerable attention as an article for scenting tobacco and wrappers for cigars, the leaves having a strong vanilla odor. A Southern paper is confident that the day is not far distant when the "deer tongue" will become one of the most important productions of the South. This is probably an extravagant estimate of the value of "deer tongue."

How is It?—It is stated that the artesian well at St. Louis developed a temperature at the depth of 3,800 feet too cold to be determined by any instrument of science at the time in use for such purpose, and that the opponents of the theory of high central heat in the earth refer to this fact as an important argument in favor of their assumption.

Good Health.

The Way to Treat Consumption.

Dr. Goodwin W. Tims, of the North London Hospital, furnishes to the Dublin *Medical Press and Circular* the following results of his experience in managing this fatal disease:

We may sum up shortly our treatment of consumption: Light, simple, and nourishing diet, in quantity always in proportion to the appetite of the individual (the palate is an excellent guide, which we should he always afraid to offend), all wholesome fruits and vegetables, a moderate amount of thoroughly cooked meat, and dilutents, tea, milk, whey, etc., according to the patient's experience, avoiding all stimulants and forcing of the appetite. Regimen: excitement of the skin by constant cleanliness, friction, and woolen clothing; fresh air, sea air if possible; exercise of every kind, gymnastic exercises, singing, reading; the avoidance of every restriction by dress upon the chest-walls, and of indolence, and self-indulgence of every kind; the exclusion of gas from all apartments inhabited by the invalid; early hours, and as short a sojourn as possible in the same atmosphere; hence it is better to take a short sleep in the day than to remain more than six or seven hours in the bedroom, the windows of which should never be shut except upon particular occasions, or under peculiar circumstances.

Drug treatment. An obstinent cough with expectoration in the member of a consumptive family, unaccompanied by much general disturbance, is most successfully treated by twelve or fifteen drops of dilute hydrochloric acid in one ounce of water every two hours. Patients often declare that they taste the chlorine in the expectoration.

An obstinate dry cough accompanied by emaciation, debility and fever, is very successfully treated by half an ounce of cod-liver oil three times a day after meals, in a draught containing one fifteenth of a grain of bichloride of mercury. Either of these remedies is good in all stages of the disease, with or without oil.

In children cod-liver oil alone is very successful; as age advances, the remedial power of cod-liver oil is diminished.

Steel is only to be given for a few days at a time. All astringents, except for special objects, are injurious. The citrate or tartrate of soda or potash should be given occasionally, and these salines are quite as generally useful as steel.

Mild laxatives occasionally are very beneficial: pills of gray powder and rhubarb for the young and a mild aloetic pill for the middle-aged will tempt the practitioner who tries them to very frequent use. Trying to help towards the successful treatment of a few varieties of consumption, it would not become me to condemn any drugs recommended by other practitioners. So intractable is the disease, that every new remedy ought to have a fair trial. Familiar with the idea of patients being induced to swallow the urine of the boa constrictor, and the pancreatic fluid of a pig, if a patient were to tell me that he had found benefit from imbibing the saliva of a goat, I should not hesitate to recommend him to persevere in its use.

The Feet in Winter.

Through the feet comes every year to multitudes—death! Especially in winter ought pains to be taken to keep the feet warm, to be healthful; the warmth comes from within. Stockings keep the feet warm because they keep about the feet the warmth which comes from them; hence those materials are the best for the feet that are non-conductors; thus it is that woolen stockings are considered warmer than cotton or silk; there is less warmth in cotton than in woolen, because they convey the heat with very great rapidity from the feet. Yet some people's feet are more comfortable in winter with cotton or silk, than woolen, because persons with a vigorous circulation give out so much heat, that if kept about the feet, perspiration is induced, this becomes condensed by the cold from through the boot or shoe, thus keeping the feet cold and clammy and damp, and most disagreeably cold, but if such persons wear cotton or silk, the extra heat is conveyed away, leaving enough to keep the feet warm.

If the pores of the skin are closed in any part of the body, that part is either unnaturally hot or cold. If the circulation is vigorous, it overheats because it cannot escape through these escape pipes of the system. If the circulation is sluggish, if there is but little vitality, the blood of the veins stagnates and the blood of the arteries, which carries heat and life, cannot get there; hence the first step in keeping the feet warm is to keep the pores open. That can only be done in one way—keep the feet clean; clean away the concretions of perspiration, oil and dust, which are always accumulating, and which seal the tops of these pores—the chimneys of the system—hermetically.

The Function of Breathing.

Considered in all its relations, the function of breathing is a wonder of wonders. Because we are familiar with the process of inhaling and expelling air from the chest, it excites neither admiration, nor even thought. By watching the play of the respiratory apparatus, however, some perplexing phenomena are presented well worth studying.

The lungs are two membranous sacks, one on each side, of unequal dimensions in men, separated by a vertical partition, but united at the bottom of the neck in a single tube—the windpipe.

When one lung is diseased, life is maintained by the other. If both are severely inflamed, ulcerated, or in any way incapacitated for vital service, death inevitably ensues.

By taking a breath of air about six millions of minute cells, which make up the body of the lungs, are distended, and at that instant of inflation oxygen is separated from it, and taken into the system. Life therefore is solely and exclusively sustained by that element.

Every living thing, from animals to the whole vegetable kingdom, is just as dependent for life on atmospheric air as man. Trees breath through their leaves. If torn away the trunk would languish and die. Were all the leaves of a full-grown apple tree placed side by side, were it possible to have their edges exactly touch, so as to appear like a carpet, it is calculated they would cover more than an acre of ground. Some of the gigantic forest trees yield leaves enough to cover an area of nearly two acres.

Our own lungs afford an absorbent on which air infringes equal to almost one hundred square feet, it is assumed by some physiologists.

In transplanting young trees it is an unphilosophical process to trim the limbs so closely that only a few twigs are left. In that mutilated condition the effort to live is a hard struggle.

More die than survive the violence, because they are deprived of their breathing organs. One side of each leaf imbibes carbon from the air for making wood, while the other throws off oxygen for keeping the atmosphere supplied with a material that supports life, without which death would reign triumphantly.

Nearly all leaves of trees contain a large amount of astringent property called tannin. When quite dry and driven about by the wind, if boiled, they yield just what is necessary for tanning leather. Barks, now extremely expensive, might be given up almost entirely if this economy were pursued. Maple, willow, chestnut, and indeed almost all those of familiar growth here at the North might be utilized in that important art, to the saving of millions of dollars in this country annually.

After the tannin is dissolved in the leaf cells the strong decoction is ready for the vats. The pulp thus deprived of the matter which prevents leaves from decomposing for a very long while, becomes an excellent fertilizer. Farmers make a mistake in gathering leaves into piles or mixing them with other manure, because it is a loss of time and labor, it is so long before they decompose and become food for living plants.—*Ex.*

Absinthe a Poison.

A French commission, consisting of experts, has just made a report, reviewing all of the methods employed in the manufacture of absinthe, and the great loss of life entailed by its use in France. They recommend that this article be included under the list of poisons, and that its sale be interdicted, excepting on prescription of a physician. They think its sale should be visited with heavy penalties, and that every effort be made to break up the indulgence in an article possessing such poisonous properties. It is not the absinthe alone that prove so dangerous, but the inordinate consumption of alcohol that accompanies it. Some have been known to take 30 glasses of absinthe every day, the greater part of which is absolute alcohol, and thus the danger is largely increased.

It is thus practically shown that the pleasant flavor of the absinthe induces persons to consume twenty times as much alcohol as they would be likely to do if their drinking was confined to brandy or *eau de vie*. Absinthe was almost unknown, except as a medicinal agent, before the Algerian expedition, under the reign of Louis Philippe. Fever made sad havoc in the ranks of the army, and the doctors recommended the soldiers to mix absinthe, which is the bitter extract of wormwood, with their wine, as a preservative against miasmata, in lieu of quinine, which was too costly to be generally distributed. During the whole of the campaign the army drank this mixture, and also mixed absinths with their brandy. The habit was retained by the troops after their return to France, and the liquor now known as absinthe thus became a popular drink throughout France. As a means of sure and speedy suicide, absinthe is scarcely excelled by strychnine.

Care of the Hair.—To keep the hair healthy, keep the head clean. Brush the scalp well with a stiff brush, while dry. Then wash with Castile soap, and rub into the roots, bay rum, brandy or camphor water. This done twice a month will prove beneficial. Brush the scalp thoroughly twice a week. Dampen hair with soft water at the toilet, and do not use oil.

STRAWBERRIEe AND THANKSGIVING.—We observe this morning—the day before Thanksgiving—beautiful strawberries at the fruit-stands. On inquiry, we find they are growu in the open air, forwarded fifty miles by railroad, and sold at twenty cents a pound.

IN LUCK.—The engineer of the Yellow Jacket mine, John F. Coleman, who drew $20,000 in the Omaha lottery, has gone to get his money.

The Diamond Fields a Fraud.

For the past few months the principal excitement on this coast has been the "diamond question," for until within a few daye it has been a qnestion, and our community has been on the tiptoe of expectation to learn the exact location of the reputed fields. Developments have, however, been made publc this week, which prove that the whole matter is a swindle and tbat the "fields" were systematically salted. Clarence King, the eminent geologist, has visited the Harpending and Lent location, and the resnlt of his visit astonishes the people who had confidence in the managers of the undertaking, and fulfils the predictions of those who had not taken, or were financially unable to take, any share in it.

Without doubting that there are on this coast diamond deposita yet to be found, we have all along taken the recent highly colored statements of interested individuals *cum grano salis*, giving the current news concerning the matter for just what it was worth; but at the same time advising our readera to be cautious in going to the distant localities indefinitely mentioned, without more assurance than the mere word of the promoters of the enterprise.

We confess, however, that we were somewhat taken by surprise to find out that the matter had been euch a deep laid scheme to defraud tbe public and that it waa a wholesale swindle. And this, too, after this particular location of Harpending and Lent had been reported on favorably by Henry Jauin, a mining engineer, who possessed the confidence of the commnnity. It is not probable, that, with all the well concocted plan, the stock could have been placed upon the market at all in the face of an unfavorable report by that gentleman. A number of onr most prominent capitalists have invested in the enterprise and lent it the sanction of their names, and by this means the stock of the original company was eagerly sought after.

Now the dream of glittering gems is dispelled and visions of fabulous fortunes have vanished. Messrs. D. D. Colton, Henry Janin and Clarence King have made reports to the company, the latter of which we give in full, and to which comment is unnecessary. It explains the whole matter.

General Colton's Report

Is one of a practical man, and explains simply how the whole thing must have been prepared. He gives an account of his trip to the diamond fields (?), bow they made 96 tests, of the most thorough and careful nature, without finding a diamond or ruby outside of a certain locality. Where the ground showed no evidence of having been tampered with they found no precious stones; where it did, they fonnd a number. He describes the ground as being in Colorado Territory, in a due south direction from Black Butte Station, and not to exceed 50 milea therefrom. In closing, he says:

In behalf of myself and the gentlemen who accompanied me, whose names are already given, the only remuneration we aek at your hands for undergoing the hardships of this journey, is that you will spare neither time, money nor skill in finding out the guilty parties to this unparalleled fraud, and bring them to speedy justice. The good name of the State and the credit of our mining interests demand it.

I have taken the liberty in this report of announcing the location of the so-called "diamoud fields of Arizona," from the fact that I consider it high time the alluring fascination of secrecy and mystery be dropped from this diamond excitement, and the world be brought to understand tbat if there be any such immense deposits of precions stones as this excitement has led them to believe, the deposit is yet to be found, as it is my honest belief that to this time no new or rich discovery has been made in the section of country this mysterious whisper has pointed to.

In the few days I have beeu counected with the management of your company, it is impossible for me to give you tbe least imformation as to who are the guilty parties in putting this fraud upon the world; but the unimpeachable integrity of every member of your Board is a snfficient guarantee that this iuvestigation will be so thoroughly conducted by you as to do justice to all parties concerned. Trusting my course in this matter may meet the approval of your body.

Mr. Janin's Report

Acknowledges in substance that he was fooled—a most humiliating confession of a man in his position, and one in whom the public had heretofore so much confidence. For an *expert* to go for a special object and then suffer himself to be led to certain localities which had been cleverly salted and for him to report favorably on a question which not only involved his reputation as an engineer, but also millions of money, is to say the least unwarrantable. He acknowledges that the ground was absolntely barren except in spots where nature had no hand in placing the gems. He explains his former report and seems to have been so convinced from the assertions of prominent men before he visited the field, that he looked upon bis investigation as undertaken not to determine the *fact* of the discovery, but to ascertain approximately the extent and value of the same.

It will be seen from tbe above that this settles the question of Messrs. Harpending & Lents' location; but what of tbe innumerable others? What of Stanton's $250,000 ruby? What of Ex-Governor Gilpin's report on southwestern Colorado? What about the diamonds in Butte county, tbe San Juan country, the New Mexico, Arizona, and Utah fields? These questions can only be answered by the lapse of time, but we are convinced tbat these localities will, under the influence of the excitement of the last few months, be thoroughly prospected. In conclnsion we give the

Resolutions of the Board of Directors

Of the Harpending & Lent Company, after accepting the reports of Messrs. Coltou, King and Janin:

The undersigned members of the Bosrd of Trustees of the San Francisco and New York Mining and Commercial Company, having become convinced, by the foregoing reports, of the worthlessness of the pretended diamond fields referred to, have deemed it due to the pnblic to publish the above reports and denounce the fraud perpetrated upon tbis Company and the stockholders by the pretended discoveries.

No further stock of this Company ehall be issued, circulated or transferred, and at the earliest practicable moment the certificates sball be cancelled and the Corporation dissolved.

San Francisco, Nov. 25th, 1872.

Report of Clarence King, United States Geologist.

SAN FRANCISCO, November 11th, 1872.

TO THE BOARD OF DIRECTORS OF THE SAN FRANCISCO AND NEW YORK MINING AND COMMERCIAL COMPANY: I have hastened to San Francisco to lay before you the startling fact thst the new diamond fields upon which are based such large investment and such brilliant hope are utterly valueless, and yourselves and your Engineer, Mr. Henry Janin, the victims of an unparalleled fraud. Having convinced you verbally that my investigations have been made upon no other than your own ground, I beg, herewith, to give a brief statement of my mode of study, and its unanswerable results. Fearing that so marvellous a deposit as the diamond fields must not exist within the official limits of the geological exploration of the 40th Parallel, unknowo, and unstudied. I availed myself of the intimate knowledge possessed by the gentlemen of my corps not only of Colorsdo and Wyoming, but the trail of every party traveling there, and was enabled to find the spot without difficulty, reaching there on November 2d.

After examining the camp ground, water notices and general features of the Diamond Mesa, I next traced the boundaries of your claims and then began in earnest to study the distribution and mode of occurrence of the precious stones.

Our first day was devoted to the sandstone table rock, at the head of Roby Gulch, where about all the stones collected by your parties have been gathered, and had our critical work ended with the close of this one day, we should have left the ground confidsot believers in the genuineness and value of the fields. My suepicious were however, aroused early in the second day's work, and I at once determined to make

An Exhaustive Series of "Prospects,"

Of which the following are the results:

First—A nearly uniform numerical rstio exists between the rnbies and diamonds.

Second—The gems, in nine cases ont of ten, lie directly upon the hsrd surface of rock or an indurated crust of soil. In the exceptional case, where I found them in crevices, there was always ample evidence that the sand or soil had been disturbed and broken up within a year.

Third—With the dismonds snd rohies occur quartz pebhles of various sizes, and concretions of iron oxyd containing crystalline particles of quartz, which are found freely mingled with the soil from surface and bed-rock; hence if the gems were a natural deposit, being of a specific gravity intermediate between the quartz and iron concretions, they must have also settled through the earth to hed-rock. I therefore selected ground on and immediately about Table Rock, where the top was more or less strewn with the so-called rubies, carefully shovelled off the surface—inch of ground and gravel—and examined hy means of sieves and pan-washing, all the materisl down to hed-rock. Ahout thirty of these tests were made encircling Table Rock, and in no instance was a ruby or diamond found.

Fourth—Ruby Guich, leading directly from Table Rock to Arnold Creek, and hy necessity receiving the wash of the gem-hesring snrface of the sandstone, was found to be extremely rich in rubles at the hesd; but this richness, instead of continuing down the bed, as, if genuine, it inevitably must be, proved to exist only in ground directly at the foot of Table Rock, where

The Soil was Clearly Disturbed, Mixed and Smoothed Over.

I sank a series of four pits to bed-rock down the gulch at intervals, excavating probably a couple of tons of materlal, aud although, as in every other iostance, quartz, and even concretions were disturbed throughout all the gulch soil, not a ruby or diamond was found.

Fifth—In the top of Table Rock and in the midst of thickly-sown rubies are certsin crevices not opened by your parties. They are filled with soil and pebhles, and more or less overgrown with grsss, ssge-hrush and small cactus plsnts. We carefully removed the top inch, dug out the whole crack, finding no trace of diamouds or even rubies. In the crevices which bore unmistskable evidence of having been tampered with, we never failed to find rubies and often small diamonds.

Evidence of "Salted" Hills.

Sixth—Upon rated dome-like portions of Table Rock, rubies and diamonds lay upon the summits snd inclined sides in positions where the etorms of one or two Winters *must* inevitshly have dislodged them, and where, moreover, they were unaccompanied by quartz or concretions.

Seventh—An exhaustive exsmination of the rock-material itself with a field microscope, revealed no grain, however minute, of either gem.

Eighth—In the ravines and upon the mesa nearly, ars numerous ant-hills built of small pebhles, mixed by the nots, and which we found to hear rubies on their surface. A still closer exsmination showed artificial holes, broksn horizontally with some stick or emall implement, through the nasural crust of the mound; holes easily distinguished from the natural svenues made hy the insects themselves. When traced to their end, each artificial hole held one or two rubies. Moreover, about these "salted" hills were the etorm-worn foot-prints of a man.

Many outside ant-hille were stndied, but there were neither artificial holes piercing them, rubies within nor without, nor human tracks.

Ninth—I discovered in the Table three smsll emeralds. Summing up the minerals, this rock has produced four distinct types of diamonds, Oriental rubies, garnets, spinels, sapphiree, emeralds snd smethysts—an associatiou of minerals I believe of impossible occurrence in Nature.

Tenth—When altogether satisfied that the gems had been "salted" on or about the Table, our party set out upon a series of outside prospects, which were carried on over all the mesa and its fisnking cañons until the absolute valuelessnese of the property was finally ascertsined.

The Results of these Ten Links of Proof

Are: Thst the gems exist in positions where Nature alone could never have placed them; that they do not exist where, had the occurrence been genuine, the inevitable laws of Nature must have carried them.

Finally, that some designing hand has "salted" them with deliberate, fraudulent intent.

Furthermore, this is the work of no common swindler, hut of one who has known enough to select a spot where every geological psrallelism added a fresh probability of houesty.

The selection of the geological locslity is so astonishingly considered, the "salting" itself so cunoing snd artful, the filling of all the conditions so fatally well done, I csn feel no surprise that even so truetworthy and cautious an engineer ss Mr. Janin shonld have brought home the belief he did, especially when, as his report states, he wae not allowed to prospect exhaustively; nor do I wonder that your second party of ten men brought back a confirmation of Mr. Janin's opinion, since they, too, were hurried from the ground without actually testing it.

I should add that on the evening of Wednesday, November 5th, when leaving the ground for the last time, I met Mr. J. F. Berry, of Salt Lake, who had arrived with a prospecting party. I honestly expressed my conviction to him, detailed minutely my mode of investigation, and ended hy urging him to remain and satisfy himself by personal examination, since he seemed to accept my result without question.

A sense of my duty as a public officer has impelled me to come directly and frankly to yon, gentlemen.

In answer to your request that I accompany General Colton back to the ground, while he and his party investigate for themselves, I place myself, my camp, men and field outfit at his disposal for two weeks, believing that in so doing I shall act as my Chief, Major-General A. A. Humphreys would order, were it possible at this sudden emergency to communicate with him. I am with respect, gentlemen, your obedient servant.

(Signed,) CLARENCE KING, U. S. Geologist.

Camp Floyd Mining District.

We present to onr readers on the first page a map of Camp Floyd Mining District, Utah Territory, Surveyed and drawn expressly for the PRESS by B. A. M. Froiseth, of the Surveyor General's Office, Salt Lake City, author of "Froiseth's new Mining and Sectional Maps of Utah." The map shows the United States snrveys by township and sectional lines adjoiniug the district, the town site of Lewiston and the numerous mines on either side of it, the roads to Ophir over the divide, to Salt Lake City by Rush Valley and to Fairfield or old Camp Floyd; also the aettlements of Cedar Fort and Fairfield and Cedar Valley and the quartz mill of the Camp Floyd Silver Mining Company. This will be a valuable map for all parties who are interested in mining in that region. We have also been furnished by Col. Froiseth with a description of the district and the principal mines which is as follows:

Camp Floyd is situated in Tooele and Utah counties and was organized about two years ago. It is distant from Salt Lake City 55 miles and is accessible from it by two routes of travel; one a daily line of fine stages, run by Wines & Kimball *via* Ophir, Stockton and Rush Valley, and the other by rail to Lehi, thence by stage by way of Fairfield. The district created little or no excitement for tbe first year, until the development of the Sparrow Hawk mine, which at once proved the richnesa of the district, and since that time it has been steadily improving as other mines have been furtber developed, and it is now considered one of the best districts in the country for milling ores. Its value has also been greatly enbanced by the erection of tbe

Camp Floyd Silver Co's Mill,

Built under the supervision of the energetic manager, Capt. E. H. Shaw. This mill is one of the most complete in the country, contains twenty stamps and is now capable of reducing thirty tons of ore daily, but with its capacity for thirty stamps, it will probably be soon reducing a much larger quantity. A tramway for the transportation of the ore from the minee to the mill has been built and is now in full running order.

The Mines.

The English Co.'s Mines the Sparrow Hawk, Last Chance and Marion have been actively worked all summer. From forty to fifty men are now constantly engaged in taking out the ore to supply the mill which is running night and day. Tbe Mormon Chief and its extension the Grecian Bend, and tbe London, consists of 3,000 linear feet along the lode by 400 in width, beginning at the upper end of the Camp Floyd mines, and running westerly along the line of croppings. The developmentss in tunnels, cuts, shafts, drifts and incliues will measure about 500 feet, ehowing a large body of free milling ore. The Camp Douglas is developing finely, and large bodies of antimonial silver have been struck about 25 feet down the shaft, running in an easterly and westerly direction. The shaft has been continned to a depth of 47 feet, where the foot wall was struck, passing through a fine body of vein matter the entire depth. From this point a drift has been commenced which is now several feet long. The Gen. Morrow, owned by the same company, is down 53 feet, and is very promising. The Antelope hss now a shaft 7x7 and 12 feet deep, and an open cut some 200 feet from the shaft, 6 feet wide and 10 feet in. The ore from this mine is of good quality, as a recent assay of quartz weut $362.70 to the ton, aud equally good results are anticipated as the work of development goes on.

The Silver Cloud has a shaft 55 feet deep, cutting a vein of ore at a deptb of 55 feet. A level has been driven 180 feet on the courae of the vein from the bottom of the shaft showing a vein of 12 feet of rich milling ore, assaying from $50 to $2,000 per ton. A tunnel has also been run 275 feet to cut the vein 200 feet below the face of the ehaft. A mill site has been located adjoining the mine upon which is a fine spring of water. The Star of the West, owned and worked by a New York Co., Joseph Rau, President, has a force of 12 men at work, and is taking out a large quantity of ore of very good quality. Tbis mine is very promising and will soon pay a handsome dividend to the owuers. Tbe Silver Circle and Wandering Boy have a large number of men employed and are developing well. Tbe Peerless, Bismarck, Elk Horn, Red Eagle and Silver Star are good mines and in a flourishing condition. Several minee have been sold during the past season to New York aud San Francisco capitalists, who have incorporated stock companies, and who are now busily engaged in developing their property.

Woodbury's Brush Machine.

The engravings shown on this page represent a machine for hunching, wiring and inserting bristles in brush backs, which is one of the most notable of modern mechanical improvements. It accomplishes a number of difficult movements with great facility and performs its work with ease. To describe the machine perfectly would require more diagrams than we would have space for, so only a more general description will be given. It divides the material to be inserted, into hunches of equal size, doubles the bunch, draws a proper length of wire from a spool, straightens it, puts it through between the two divisions of the doubled material, thrusts the wire into the form of a screw thread, screws the bunch into the hole in the back, and then causes the cut end of the wire to engage the wood like a pawl, so that the bunch cannot be unscrewed, finishing its work so strongly that the hunch can only be pulled out with strong pincers, and it does this by only stripping the wire over the end of the hunch.

The large figure is a perspective view of the machine with all the parts in adjustment for work, the brush block being in position and two of the holes having had bristles inserted in them. A very clear description of the machine has appeared in the *American Artisan*, and we can do no better than to use its words:

The material to be inserted is first drawn in between the teeth of a comb. *A*, Fig. 1. This comb is taken out of the machine for this purpose, and there being duplicate combs, empty ones can be filled while the machine is at work, so that it may run without intermission. The combs are filled by a very ingenious appliance, which enables one operator to serve several machines, and the material is drawn in so that it is compressed and held at the middle of the fibre or at any other desired point. The comb, when placed in the machine, slides in guideways, being actuated by a traverse motion, which, as fast as one space is emptied of its material, brings another up to the mouth of a twisted channel, *B*, Fig. 2, into which the bristles or other fibrous material is forced by a feed movement very much resembling the four-motion feed on a sewing machine, the teeth of which engage the entire rank of fibers.

The office of the twisted channel is simply to bring the rank of fibers from the vertical into the horizontal position. In this position it reaches the divider, *C*, where a portion of the rank of fibers is compressed by a spring device, so as to insure the proper quantity in the hunch which the divider separates. This divider which is attached to and forms a part of the tube which carries the bunch, has imparted to it, by suitable mechanism, a vertically reciprocating movement. As it rises, the peculiarly shaped point, *D*, separates from the rank of bristles enough to form a hunch, and as the separated portion cannot rise, the divider, in its further upward movement, brings the hunch down along the inclined way or channel, *E*, to the bottom, *F*, of the way; here it lies directly under the doubling and twisting plunger, *G*, shown in detail in Figs. 3 and 4.

The plunger, *G*, now descends, and, engaging the bunch in a hollow in its lower end, forces it down and doubles it in the manner shown in Fig. 3. Meanwhile the wire, *I*, Fig. 4, has been drawn off and straightened, preparatory to being thrust through a slot in the plunger at *H*, Fig. 3, and between the ends of the looped bristles, which being accomplished, it is cut off in a short length, as shown in Fig. 4.

The plunger and tube now descend together to the block, carrying with them both bunch and wire. On the interior of the tube is cut a female screw-thread. The plunger is caused to turn on its vertical axis during the descent, which winds the wire about the bunch of bristles in the form of a screw-thread, as shown in Fig. 4. Continuing the same rotating movement without descending further, it then screws the wired bunch into the block, *J*, Fig. 1, the lower cut end of the wire plowing a thread in the hole; then when the bunch has entered to a proper depth, a slight turn of the plunger in the reverse direction takes the twist out of the bristles, and the upper cut end of the wire engages the wood. The plunger is then withdrawn, and the same operation is gone through with a succeeding bunch, and so on, till all the holes in the block are filled.

The block lies on its back on a table made adjustable to any angle, so that the bunches may be inserted obliquely as required, the pitch of the table being regulated by the notched arc, *M*, and other appliances readily manipulated by the operator.

While one bunch is being inserted, the point of the guide, *K*, is inserted into the next successive hole by the operator, and as soon as the bunch is inserted, this guide automatically draws the hole with which it is engaged directly under the plunger to receive its bunch, accurately centering it, and obviating the possibility of mistake. The guide then releases itself from the hole, which immediately receives its bunch, and so on till the block is filled. The machine works tampico and all other vegetable fibre used for filling brushes as well as bristles, and the knots or bunches are inserted in hard rubber with the same facility as in wood.

Seventy-five to eighty bunches per minute is an easily maintained rate, and this is done without the slightest strain or injury to a block of any material, even of the most delicate, as nothing but the wired bunch enters the hole. It does this, moreover, in a more perfect and uniform and durable manner than can possibly be achieved by hand labor, or any combination of devices hitherto produced.

For further information address the Woodbury Brush Machine Co., No. 30 Cortlandt St., New York.

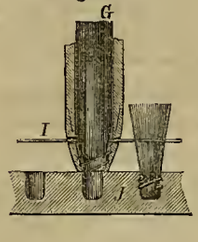

Fig 3

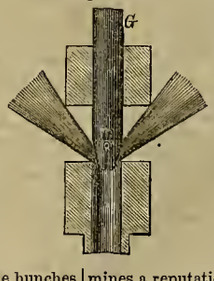

Successful Mining.—As an example of successful work on mining property we make some extracts from the quarterly report of H. Prideaux, of the Pacific Company's works at Austin, from a London paper. There were 819 feet of levels driven under contract; 183 feet of cross cuts; 198 feet of risers; 200½ feet of winzes sunk and 379 fathoms stoped. Raised from stopes 508 tons of ore; milled 498 tons at the Manhattan mill; gross assay value $95,564.53; average value $191.80 per ton. *Net* amount received from the ore $65,237.21. Net, we assume to be after paying charges for mill work. Ten tons were shipped to Liverpool of an estimated value of $6,500 to $7,000. The Manhattan Company calculates to return 90 per cent. of the contents when they have the Stetefeldt furnace in operation. The company having no reduction works of their own are unable to work any but the richest ore, which Mr. Prideaux considers a great drawback to their prosperity. This gentleman refers with pride to the results accomplished under his administration. He has drawn no money from London—an astonishing fact. He has remitted bullion and ore as profits and paid off some old debts.

Let our English friends send out a few more such gentlemen as this one appears to be, for he is unknown to us, and our mines will bear a much better reputation in Europe as paying properties than they have enjoyed hitherto. We do not think that the failures which have happened on this coast should always be attributed to the *mines* themselves, the only wonder has been to us that so many have paid even expenses under the extravagant systems of management so long in use, but we hope this will be remedied in the future. Intelligent, honest and economical management will do more to give our mines a reputation abroad than anything else that could be done to further that object.

Gloves.—Two thousand dollars worth of buckskin gloves per month are made at one establishment in the little town of Healdsburg, and about $1,000 is paid to the women and girls employed.

Miscellaneous.

The Caribou Mine and Reduction Works.

Four miles from Caribon, and 1,200 feet lower at the junction of the roads diverging to the four points of the compass, this embryo city is rounding into form. A beautiful sheet of water, the Middle Boulder, flows by on ths eonth, and pine-clad mountains rise grandly around it; a few miles below ie Bouldsr cañon, where nature has hnng one of her most eublime pictures. A great quartz mill and a little saw mill are humming to the tune of busy and profitable lives. The hotel, the post-office, and the two stores, together with two or three boarding houses, a blacksmith's shop, and fifteen or twenty dwellings and other buildings, besides the mills, is the aggregate of the town. The

Caribou Silver Reduction Works

Are the making of this rising little bnrg. The external dimensions of this great mill are 100 by 165 feet. There are five terraces or floors, devoted to as many different degrees iu the treatment of ores. The first, or npper floor, upon which rests a Blake crusher, is the ore room, where the wagons deposit the silver rock. It is then passed through the crusher and into the dry kiln. From the kiln it goes to the 15-stamp battery, and is there ground to powder beneath ponderous iron pestles, weighing 750 lbs. each, dropping 8½ in.. and 100 times per minute. After leaving the battery it passes through a No. 40 wire sieve, or bolt cloth, and hy conveyers to the hoppers resting over the Brnckner furnaces awaiting to receive the glittering dust. These great cylindrical furnaces have a capacity of 2 tons each every eight hours, or 1 ton for each of the 24 hours. From the furnace it falls red-hot into an iron car resting on iron rails heueath, and at each round a charge from a single furnace, nntil the four are empty. It is then wheeled a few feet, and dumped and spread on the cooling-floor, where it is wet down, or sprinkled with water, as we do dusty streets, and left to become cool. In the amalgamation paus the dusty treasnre next finds a lodgment. These pans are 10 in nnmber, each with a capacity 1,000 lbs to the charge. In the pans quicksilver is introduced, which collects to itself the genninesilver, after which it ie drawn off and strained, thus separating and saving hoth. The remaining contents of the pans are then let into five settlers, that catch any particles of silver or quicksilver that may have escaped the pans; and, to guard agaiust accidents, in the basement are two agitators, each of which receives separately the entire contents of the five settlers through which the hase material passes on its way to the creek. Thns it will he seen no loss can he snstained. The snperintendent, Prof. J. M. Dawley, offers $100 per ton for every ton of the material after it leaves the agitators that will assay $7. Alter the amalgam is taken from the pans and atrained it is snbmitted to a retort, when the remainder of the quick is snhlimed or vaporized, and the silver then becomes crnde bullion. It is next submitted to plumbago crucibles and placed in the meltiug furnace, where it becomes molten silver, after which it is ponred into cast-iron moulds, brick shape; out of them comes those famous silver bricks weighing from 1,800 to 2,000 ozs. each. These bricks are then taken to the assay office, and there assayed and marked, which renders them ready for shipment: 850 fine is their nsnal average, but some lots rnn as high as 950. These works are styled the old Freiberg process of calcining and amalgamating. The mill is bnilt on the Nevada stylc, and in all its details for treating these ores it is as near perfect as snch works can well he made. All this extensive and ponderous machiuery is driven by an engine of 150 horse power. From 8 to 12 per cent. of ealt is used, or about 3500 lhs. every 24 hours. The labor of 20 meu is requnred in aud about the mill, to keepit in operation day aud night. On the mill and mine $3,000 per month are expended, and 130 msn, including contractors, find employment. J. M. Dawley, of Nevada, one of the most skilful assayers, metallurgists and millmen on the Pacific slope, has charge of the assay-office and the entire mill, and is likewise driving the tnnuel at the miue. The coming year it is designed to double the capacity of the mill, thereby giving employmeut to a greatly increased number of meu, and add another fraction to the hullion product of the world.

Ths thriving town of Caribou, of 100 or more houses, is situated 9,500 feet above the level of the sea. Its first settlement was in May, 1870, when the celebrated silver mines hereabonts were first discovered. The place is accessible by good roads that span the couutry betweeu here and the older towns and the mining districts extending to the southern border of Colorado. Down the Middle Boulder, through cañons and gorges, whose mnral sidee rise like frowuing battlements, an important thorough-fare has been established to Boulder City, a distance of 20 miles, over which four-horse hacks and a mail perform tri-weekly service.

The Caribou Mine.

The grandest enterprise of this gold and silver region is the great "Caribou Mine," located about 800 yards west of the town, at au altitude of about 10,000 feet above tide water. It is universally conceded by experienced miners to be the richest and best paying eilver mine, in proportion to its development, of which we have any record. On the surface it extends 1,400 linear feet, for which a Government title has been obtained. Thers are eleven shafts, aggregating over 1,000 fest, ths deepest of which is 290 fset from the surface. Ths mins coutains ten levels, aggregating not far from 1,300 fset, width of crevics from 7 to 9 feet, with smooth and well-defined walls. This extraordinary silver ledge is embedded in a mountain of syenits, but the vein is so perfect that mining oprations ars carried ou at a rapid rats; and as the ores contain a large percsntage of sulphnrets and galena, carrying tons of silver glance and brittle silver, with very little zinc-blende, and no antimony or arsenic of any consequence, they are rendered exceedingly easy of reduction, while their richness is almost fabulous. Parties offer to wager that a ton of ore can be obtained from this mine that will yield $10,000—coin value. Two selected specimens, recently assayed by Professor Dawley, gave as follows: One at the rate of $26,301.60, and the other $29,797.40 per ton of ore. Along some of the principal levels, and at the bottom of the main shaft, the ore is so loaded with native silver that large bodies of it will yield in hullion from $1,000 to $10,000 per ton.

A better-timbered and a more systematically conducted mine is not to he found; it is as complete in all ite details as a great mine can well be. Over the main shaft stands a whim-house, 32 by 130 ft., a 15-horse power engine, a blacksmiths' shop and other useful apartments, all nnder this one roof. East of the main shaft another whim-house, 32 by 60 ft., has been huilt, where the ore is hoisted by horse-power from a depth of 170 ft. below the surface. West, again, two more honses are being erected, each 32 by 65 ft., for hoisting ore from shafts No. 5, 6 and 7. Near the base of the Carihou hill, on the east, a tunnel is being driven for the pnrpose of thoroughly draining the Carihon Mine, and to facilitate the handling of ore from the main shaft to the mouth of the tnnnel. The distance on the surface ie 1,058 ft., the length of the tunnel to the main shaft will he 840 ft., and its terminns will be 420 ft. heneath the snrface; 192 ft. are already completed, and nine men are crowding the work night and day. It will cut 15 or 20 rich lodee, and drain several valuable mines besides the Carihon. The coming winter will witness its completion, and render more valuable the tributary mines that surround. A total of 84 men are now at work on the tunnel and the great mine it is to penetrate, and the company propose to double that nnmher when the tunnel is completed.

The roads and all the varions interests pertaiuing to this mine are in the best possible conditiou, and the employeee eeem to take as deep an interest in the enterprise as the owners themselves. The vein broadens and increases in richuess as the work of development goes on; and, taking the present indicatione as a criterion, the mine within the next five years will prove equal, if not superior, to any eilver mine in the world. The ore at present yields at the mill an average af $200 per ton, aud the capacity of the mill is 20 tone per day, but it is the company'a intention to enlarge their works so as to enable them to take out and reduce ore that will produce $10,000 worth of hullion every day.—*Rocky Mountain News.*

The Sau Juan Country.

The Denver (Col.) *Tribune* has the following concerning this portion of that Territory, which, by the way, in addition to its mineral wealth, is said to contain extensive diamond fields: In the sonthwestern portion of Colorado, at present nnder the nominal control of the Utes, there lies a vast district, diversified with monntain and plain, magnificently watered and timbered, and generally considered as ahounding in an unnsual degree of mineral wealth. Without any exact bonndaries this great stretch of country ia known as the San Juan District.

Varions attempte have heen made, in earlier years, to effect a permanent lodgment of whites in the District, but nntil the past season, all snch attempts have proven disastrous, thereby throwing a sort of discredit over the country, in the minds of many, which was altogether nnjust.

But without regard to the experiences of the past, which have heen fully detailed by *Tribune* correspondents, it is gratifying to know that the present condition of the District ie both prosperous and promising, and that a future development is sanguinely anticipated, equal to that of any portion of Colorado.

The arrival in Denver, of Col. Newgent and son, Capt. B. F. Newgent, with a large assortment of the very richest kind of specimens establishes the wealth of the District heyond peradventure.

The nearest town to the San Juan mine is Rio del Norte, formerly known as La Loma, which is described to be the Denver of South-western Colorado. It is in a prosperous condition, aud growing wonderfnlly.

An excellent toll-road is now in conrse of construction from Del Norte to the mines, a distance of ahont 100 miles. This will he completed by spring. At the mines there have been several hundred miners at work, and all were encouraged, contented and confident, Next season, the entire District will be crowded with a busy population, and we may look for the most wonderful development from this hitherto comparatively nnknown portion of our Territory.

We aunex the results of a number of assays made from the more prominent mines in San Juan, which demonstrates more forcibly than words can do both ths extent and valus of the discoveries:

The Table Mountain Blue Gravel Co.

The Sonora *Independent* of a recent date has the following: Having heard it rnmored that this Company were so fortunate as to strike the famous New York channel, ahont a mile or more away from where it was last worked hy the New York Co., when their tnnnel was closed hy a ten-year litigation, we paid the mine a visit aud were well rewarded for our expenditnre of time. As is well known in this connty, the New York Co. opened a rich mine in Tahle Mountain from the *west* side, while the Humhug Co. opened in the same mountain from the *east* side. Both companies thought they were working in the same ancient river bed, though commencing a mile and a half or two miles apart, and each claimed grouud beyond the bounds set hy the other. A lawsuit resnlted which lasted nearly eleven years, and which was finally compromised by Bernhard Marks and Gen. G. A Darrow, on the part of the New York Co., aod Messrs. Mitchell and Wheelock, on the part of the Humbug Co.

As soon as the case was thrown out of eourt, (the next trial would have heen the eleventh) Bernhard Marks and Gen. Darrow bought the other parties out, and formed the company which, under the superintendency of Mr. Marks, is now working with unprecedented energy hoth mines at once. Although the Humhug Co. worked their grounds night and day for twenty-one years, and the New York Co. did the same for ten years, present developments show that neither mine is more than fairly opened. In examining ethis mine it wasncouraging to note the permanency promised by the developments presented, and we mentally exclaimed: "It will he a long time before Old Tuolnmne will be played ont." We were politely shown through the miue and were encouragingly impressed with the extent and richness of Tahle Mountain.

A new slope 450 feet long has just been completed at heavy expense into the New York part of the mine. This slope taps the Humbug channel and demoustrates that both companies erred when they thought they were workiug the same channel. There are two channels that, so far as explored, seem to have no connection with each other, though it is probahle that they *do* connect somewhere in the mountain. The rich gravel now beiug washed is out of tho Humhug chaunel and the Superintendent is putting forth energetic efforts to get into the New York channel, which is known to he far richer than the Humhug.

As the Humhug Co. worked up their channel they left the high ledge on their left entirely unexplored. When Mr. Marks became Snperintendent, he ran a drift over this ledge, and to his delight and the snrprise of the miners, found that what was supposed to be the shore of the ancient river was really a har covered with anriferous gravel, and heyond which lies another channel, parallel with the Humhug channel, and showing the coarse, hlack gold characteristic of the New York channel. Unfortunately, the drift had heen started from hreasted ground, and just as the developments were becoming interesting, the entrance to the drift became too dangerons to allow of its heing continued Although Superintendent Marks seems to be the only one on the ground to doubt the existence of the New York channel at that place, he has manifested sufficient confidence in its probability to start a new gangway in that dircetion, which he is pushing twenty-four hours a day. We take great pleasure in chronicling these evidences of our county's wealth, and have reason to know that in the near future we shall be able to eall attention to many other golden developments in the same and other parts of Tuolumne County.

Mauna Loa.

This grand volcano is again in eruption. There are few volcanic mountains that present a mors thrilling spectacle. It is situated in the island of Hawaii, in ths Sandwich group. Viewed from the sea it is most majestic, risiug to the height of nearly 14,000 feet in ons huge mass. The summit is visihls for an immense distance. There is upon the top a crater of enormous size, said to be not less than six miles in circumference, and mors than eight hundred feet deep in its shallowest part vast abysses sinking down from that into unfathomable depths below. Other craters mors active, but of smaller extent, exist upon the sides of the mouutain, and frequently becoms the cause of alarm to the inhabitants of the island. The chief of them is on the eastern side, known as Kilauea, and has an elevation of a little more than four thousand feet. From these craters eruptions are of frequent occurrence. As many as eleven have been recorded during the last eighty years. The crater of Kilauea was accurately described by Count Strzelechi, who visited it in 1838. He remarks in reference to it:

"Nowhere does the solution of the great problem of volcanic fires hy Sir Humphrey Davy receive a more palpable illnstration than here. The access of water to the ignited masses of minerals, of alkaline and earthy hases, by which that great philosopher explained the convulsions of volcanic fires, is displayed here in most portentions, most awful effects. It is only to those millions of vents all aronnd the crater through which the superabundance of steam escapes—to the millions of fissures through which the sulphurous and sulphuric acids liherate themselves that the preservation of Hawaii from utter destruction by the expansive forces of steam and gases is ascribed.

THE ONLY NICKEL MINE.—Few people are aware that the nickel, from which onr smaller coins are made, comes from a single mine, which is the only one in the country that is now being worked. This mine is situated in Lancaster county, Penn. It has been worked for seventeen years, aud developed to a depth of 200 feet. The length of this lode is between two and three thousand feet, and it produces from 400 to 600 tons per month, employing in the working of the mine a force of 175 men. In the arts, nickel is rapidly growing into favor as a substitute for silver in plating steel, iron and other metals. Its commercial demand is rapidly increasing, and as it is much cheaper than silver, it will undoubtedly he adopted in the manufacture of many articles, as a substitute for that more precious metal. One mine, the Mine-la-Motte tract, Missouri, was worked from 1850 to 1855. The ore was the sulphnret, associated with lead and copper. About $100,000 was realized from the croppings of the vein. Croppiugs of nickel ore are found also in Madison, Iron, and Wayne counties, Missouri. The refiued metal is worth $3 per pound.—*American Manufacturer.*

NEW QUARTZ BATTERY.—A short time since, says the Deer Lodge *Independent*, we mentioned that our townsman, G. S. Owlin, had invented a new quartz battery. One day thie week we examiued the model that is to he placed in the Patent Office. The battery ie so arranged that the quartz is crnshed in about the size of ordinary peas under the first stamp. It is then carried by a chute nnder the second stamp which has less drop and double the speed of the first. Here a finer screen is used aud it theu passes down to stamp No. 3, where it is reduced to dust. The last stamp being rnn faster than tho second will have less drop. For example: The first drop will fall ten inches, the second seven and the third four inches, and so geared that the first will drop 100 times per miuute, the next 200 and the last 300. The iuventor claims that by the nse of this battery, the same number of stamps will thoronghly pulverize one-half more quartz in a giveu time than that by the old style of batteries. The invention is a novel one and we doubt will not prove a valuable adjunct to mining.

LEGAL HOLIDAYS.—By the Civil Code, section 3,574, it is provided that "Holidays, within the meaning of this Code, are, every Snuday, the 1st day of Jannary, the 22d day of February, the 4th day of July, the 25th of December, every day on which an electiou is held throughout the State, and every day appointed by the President of the United States or hy the Governor of this State, for a public feast, thanksgiving or holiday." Section 3,574 (same page) provides, that, "if the 1st of January, 22d of February, the 4th of July, or the 25th of December falls on Sunday, the Monday following is a holiday."

CEMENT FOR AQUARIA.—The trouble with red lead and oil is, that it is apt not always to adhere to the glass. Probably the best cement is that which consists of three parts of powdered pipe-clay, one part oxide of iron, and as much linseed varnish as is sufficient to make a stiff paste; or the so-called stone cemeut — nine parts of pipe-clay, one of litharge, and so much linseed oil as to he of proper consistency. This becomes as hard as iron, and adheres with great tenacity to glass or almost any other substauce.—*Journal Applied Chemistry.*

SCIENTIFIC VALUE OF BEAUTY.—Mr. F. T. Mott, of the Brstish Scientific Association recently read before that body an elaborate paper on the "Scientific Value of Beauty" in relation to the doctrines of selection as held by Mr. Darwin.

DEWEY & CO.,

American and Foreign Patent Agents, Publishers of the Mining and Scientific Press, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, Brazil, Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the griuding surfacee.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO.
We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Ormmes, will be sent free upon application.
7v25-tf JOHN TAYLOR & CO.

Agents Wanted for Zell's Encyclopedia.
Z.E. is a Dictionary of Language. It contains every word in the English language with its derivation and definition.
Z.E. is a Biographical Dictionary. It has a sketch of every noted person of all ages, many of them with portraits.
Z.E. is a Complete Gazetteer. It has a description of every county, sea, lake, river, mountain, town, etc., in the world.
Z.E. is a Medical Dictionary. It contains a description of diseases, remedies lustruments, surgical operations, etc., etc.
Z.E. is a History of the World. It contains a description of the migration of races, the progress of nations, their customs, laws, religions, etc.
Z.E. is a complete Natural History. It describes all animals, birds, insects, fishes, and reptiles.
Z.E. is a complete work on Botany. It describes every plant, flower, vegetable, and tree, with their properties, uses, etc.
Z.E. is a complete work on Mechanics. It describes all new inventions, engines, machinery, tools, etc.
Z.E. is a complete Church History. It describes impartially the various divisions of the church of all ages.
Z.E. is equal to a whole library of works. It describes every material or non-material thing that is capable of description in the language.
Z.E. is well illustrated. It contains nearly three thousand engravings of persons, animals, plants, trees, flowers, machines, buildings, etc.
A specimen number, containing forty pages, will sent to any address on the receipt of ten cents. Sold only by subscription. Apply to

The C-Spring Roller Skate.
PATENTED 1871.

Rights and Skates for Sale.
This superior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.
THIS SKATE IS POSITIVELY NO INFRINGEMENT
Of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.
Every pair Warranted to be just what it is represented. Parties intending to
START A RINK,
Should examine and test this Skate. Sample pairs sent C. O. D. on application.
In ordering samples, state the number of boot or shoe worn, and whether for lady or gentleman.
For City, County or Rink Rights, call on or address

A Useful California Invention.

Hydraulic Elevator and Sewing Machine Motor.

Elevatore in crowded cities are now conceidered a neceessity, and few of the large wholeeale houeee in four or five etory huildings are without them. By their nse the npper etoriee are made availahle, not only as etore, but as salee roome, and goods may he displayed as well, and eometimee to hetter advautage in a room lighted from the roof, than they can on the ground floor. To run theee elevators by eteam requires an engineer, and etill further increasee expenses hy a higher rate of insnrance, fuel, etc. It is evident therefore that water power is the most convenient motor, eince no assistant ie required, and the whole arrangement may he managed hy eimply pulling certain ropee to open or close the proper valves. As a general thing, however, difficulty has heen experienced in providing a water engine which would not leak, or make that peculiar unpleasaut thumping noise which is nsually noticeable.

A California inventor has, however, eucceesfnlly constrncted a hydraulic elevator, which does away with these disadvantages, and its geueral introduction eeems to ue only a qnestion of time. An extended description of this machiue we will defer until ahle to procure the cuts necessary to explain it accurately, hnt a general idea may he given briefly. The elevator consists simply of two oscillating cylindere with right-angled crank, and the oscillation opene the porte precisely in proportion to the travel of the pistou; therefore there is no jar or sudden concussion asin ordinary water engines. This plan admits of the stroke heing changed without any change in the porte, and still the flow of water is in proportion. The cylindere each oscillate on a taper plng in which are a series of porte corresponding to a series of ports iu the cylinder, that oscillate with it, and are so adjnsted as to cut off and turn on the water at the proper time. The piston is connected in the ordinary manner.

The principle of this machine is that the circle described by the crank must be in proportion to the travel of the piston, and the oscillation of the cylinder must likewise he in proportion, which opens and shnts the ports exactly in proportion as the piston travels. Any number of norte can he made so as not to cramp the flow of water. In these machines more area of port is always made, than there is area of pipe, and moreover, the water is nsed over twice. It is run into a eide tank and utilized as a hrake to hring the cage down. Ordinary drums, etc., are nsed as usual, with a eafety clutch. The peculiar arrangement of the piston and ports allows the engines to attain a great speed of piston. They have heen operated successfully to a speed of 200 feet per minute without any jar or concussion.

The machine is adapted for use in any place where there is a good pressure of water either for quartz mille or on a sewing machine. We eaw a few machines of small eize which were attached to sewing machines and in practical operation. They work very smoothly and rapidly, at the same time without noise. They are placed under the tahle of the machine, and are regulated hy a treadle connected with the valves. The mannfacturere have orders for more than they can make with their preeent facilities, and are now makiug peculiar toole to enahle them to turn out the machines in quantities and of uniform eize so that piecee can he duplicated. One of the sewing machiue motors is iu operation in Sullivan & Fratinger's Cloak Store on Montgomery street, and another at the Ladiee Emporium under the Grand Hotel. When the process of manufacture is more systematized, as it will he, they can turn out the the machines at less cost than at preeent, and their use will doubtless become more geueral.

Thie engine ie strictly a California invention, brought out here and in use here. The inventor, Mr. H. B. Martin, of Martin & Co., No. 13 Fremont etreet, the manufacturer, is a Californiau, hut is at present in St. Louis introducing his invention. Quite a number of the elevatore have heen put up in thie city in such places as the wholesale houses of Uhlfelder, Cahn & Co., Shweitzer, Sachs & Co., L. & M. Sachs, Hostetter & Redington, Huntington & Hopkine, Bradley & Rulofeon, at the Custom House, and in many prominent houses iu the wholesale part of the city. In some places the hoistiug apparatus was fitted up very handsomely, and everywhere the engines seemed to give satisfaction. The machines will he made of different eizee, and Martin & Co. are preparing to turn them ont in numbers.

Wooden Pavement.—However well the different etyles of wooden pavements have stood the teet of durahilty in citiee in the Eastern Statee they have proven almost entirely worthlese in San Francisco. The majority of the streets here which are laid with Nicholson pavements are in a most deplorahle condition. The light rains of the heginning of this month swelled the wood eo much that it has hulged np in places to an extent not at all in accordance with city surveys or general utility. Our long and rainless summere dry the wood thoroughly and when the first rain comes its effect is immediately apparent. The only possihle benefit noticeahle, is the queetionahle one that the dieplaced hlocks offer a ready harvest of firewood for the impecunious familiee in certain neighborhoods; but whether the more fortnuate pereons who live on streets paved with these hlocks are satisfied to hear thie compnlsory charity, is another question.

It is a matter of douht whether there is any really efficient and durable pavement after all. The Russ is almost as had as the horse disease, in wet weather, and cohhle stones are an ahomination hoth on account of noiee and destruction to the horses feet. The Nicholson has a fine appearance and in dry weather does very well hnt onr seasone in this country have the effec of almost preventing travel on the streets laid with it, wheu the rains first come. The quesof pavemente is under consideration hy our City Fathere, and it is believed that those made of wood will he officially condemned. Can not some inventive geuius devise a new pavement which will be serviceable, and at the same time cheap?

New Incorporations.

Independent and Omega M. Co.—Nov. 21. Location: Virginia District, Storey Co., Nevada. Capital, $3,000,000, in 60,000 shares. Trustees—Philip Meagher, Wm. H. Brewer, T. C. Sanborn, L. B. Ward and R. H. Weber.

Frazer Lock Manf'g Co.—Nov. 21. Object: To manufacture and vend the Frazer lock. Capital stock, $150,000, in 1,500 shares. Trustees—Samuel P. Taylor, Jonathan Kittridge, Benjamin H. Freeman, John Daniel, Charles Miller, Vitruvius Frazer and Wm. L. Bovyer.

Miners' Protective Association.—Nov. 21. The objects are: To cultivate social intercourse, to maintain a Cheritable Fund for the benefit of the members, and for the furtherance of all moral and benevolent purposes. Branch Associations will be established in different parts of the State. Trustees—Henry Schening, John Garwis and John Young. H. Meyer, President; Albert H. Nelson, Vice-President; John Schneider, Treasurer; James B. Wheeler, Recording Secretary; H. H. Suhling, Financial Secretary.

Meetings and Elections.

Frazer Lock Manufacturing Co.—Meeting, Nov. 26th, Officers elected as follows: Benjamin H. Freeman, President; John Daniel, Vice-President; Vitruvius Frazer, General Manager; Daniel McLaren, Secretary; Charles Miller, Treasurer.

Carson Consolidated M. Co.—Nov. 20th. Trustees—R. F. Knox (President); J. S. Nesmith, J. S. Jameson, E. D. Hutchinson and A. D. Carpeuter (Secretary and Treasurer).

Mining Accidents.—An unusual number of mining accidents seem to have occurred within the past few weeks, and a large proportion of them fatal. In most mines of any size; all possible precautions to provide against accidents are taken, but it is impossible to provide against carelessness, especially in the use of powder, so we hear of many fatal cases.

On the 22nd, Michael Hawkins was fatally injured by the premature explosion of a blast in the Crown Point mine.

Cyrus Grant was severely hurt in the Julia mine Washoe, by the cage dropping upon him as he was landing at a station.

Fred Wagner was crushed to death in the machinery of the Magnet mill last week.

Thomas B. Mills was instantly killed on the 11th inst., by falling down a shaft in the Sutro Tunnel, a distance of 275 feet.

Richard Jackson was killed last week, at the Amador mine, Sutter Creek, by being knocked down the shaft—1300 feet—by the hoisting bucket swinging against him, while he was standing near the mouth of the shaft. His body was terribly mangled.

A man named McGowan was killed recently in the Egan mine, Egan Cañon, Nevada, by falling down the shaft—420 feet deep.

The Gold Hill *News* mentions a narrow escape of a German in the Bowers mine. A shute was blocked up with boulders, and a charge of powder put in beneath to loosen it. It did not explode until jnst as the German went to examine it. About three car-loads of rock covered him up, but when dug out he was, strange to say, totally unhurt. The *News* thinks he is the hardest Dutchman it ever heard of.

Railroad Convention.—A meeting of the citizen of Sau Mateo Couuty was held at Redwood City, on the 26th, to take into consideration the feasibility of building a narrow-gauge railroad, through the county. The matter was fully discnesed, an addreee preseuted, and resolutions adopted to the effect that the county needed the road; that it ehould take stock in it, and that an Aseociation be immediately formed for the purpoee of constructing the road; and an Executive Committee he appointed to receive subscriptione. This is a step in the right direction.

Ore Shipments.—A dispatch of Nov. 26th, from Battle Mountain, Nev., states that 6 "prairie schooners" arrived there on that date, with rich silver ore from the Consolidated White and Shiloh minee at Galena. The ore was shipped to San Francisco.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[Reported Officially for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Nov. 26th, 1872.

For Week Ending November 12th, 1872.*

Furnace for Roasting Ores.—Martin P. Boss, Enreka, Nev.

Gang-Plow.—Charlee Kewin, S. F., Cal.

Tappet for Quartz Mills.—Benjamin McCauley, Grass Valley, Cal.

Apparatus for Amalgamating Gold and Silver.—James Oliver, Ophir, Cal.

Manufacture of Sugar in Blocks or Cubes.—A. F. W. Partz, Oakland, Cal.

Fruit Box.—Charles W. Weston, S. F., Cal.

Animal Trap.—George Barr, Clatskanie, Oregon.

Car Coupling.—Elisha T. Barlow, S. F., Cal.

Balancen Slide Valve.—Henry Kessler, S. F., Cal.

Bottling Machine.—James Armstrong and Samuel Marks, S. F., Cal.

Bottling Apparatus.—Asher S. Taylor, S. F., Cal.

Device for Charging Drill Holes.—Francis X. Lavalle, Auhurn, Cal.

*The patents are not ready for delivery by the Patent Office until soms 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacinc coast inventors transacted with greater security and in much less time than by any other agency.

Ely District.—We have received from A. Noel, room 20, Hayward's Buildiug, an excellent map of Ely district, Nevada, compiled and drawn by F. E. Durand, C. E. It shows the location of the mills and mines, and the relative position very clearly, together with the route of the Pioche and Bullionville Railroad, and the eituation of prominent officee, buildings and stores in Pioche City. The map is well executed and will he found very convenient for partiee interested in this rich and growing camp.

Coal.—A coal mine has been found in Tehama county, near the railroad; the vein ie eight feet in width. The coal hae heen tested and found to hnrn well.

The Mining and Scientific Press for 1872 is Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth mors to readers, who can find handily that which intereets them most. This plan will be continued in Volume XXV.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Sclentific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press i not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published expericuces often eave costly experiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readere of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheep and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands preeminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Addrees

DEWEY & CO.,

Mining and Scientific Press and Pacific Rural Prese Office, 338 Montgomery St., S. F.

Our Agents.

Our Friends can do much in ald of our paper and the cauee of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Wm. G. Campbell—Santa Clara Co., Cal.
Jesse A. Pierce—Nevada and Placer Counties, Cal.
Frank S. Chapin—California and Oregon.
I. N. Hoag—Sacramento, General Agent.
F. M. Shaw—Southern California.
L. P. McCarty—General Agent.
A. C. Knox, City Soliciting and Collecting Agant.

Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21sp70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy72, that he has paid to the 4th of January, 1872; 4jl73, to the 4th of July, 1873. The inverted letters (ɟɐɥɟ, etc.,) occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

☞ *Postmasters, please send corrections also.*

☞ Send by letter, and give your name and P. O. Address, when you wish this paper stopped, if it is continued beyond the time paid for, as sometimes happens through request of agents or other parties. Returning the paper, or telling the P.M. you will not take it, is not sufficient notice. Parties requested to notify us, frequently fail to do so. Papers sent back are liable to miscarry. Without your address with your name we might have to look over near 10,000 names before finding yours, to erose off. We do not intend to send the paper to a single person who does not desire it, and in case of mistake, will thank any subscriber to inform us. bptf

Mining and Other Companies.

Owing to the time necessary to await the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Excelsior Silver Mining Company—Location of works, Yellow Pine District, Lincoln County, Nevada.

At a meeting of the Trustees of the above named company, held October 29th, 1872, at the office, No. 640 Washington street, San Francisco, it was, on motion, ordered that the following resolution, which was unanimously passed at a meeting of the Stockholders, held October 28th, 1872, be advertised for one month in the Mining and Scientific Press, and a personal notice served on each member:

Resolved—That we, the Stockholders representing in our individual names 4,840 shares of the Excelsior Silver Mining Company, do hereby mutually agree to return our individual certificate or certificates in stock now held by us and standing in our names, agreeing that upon a pro rata division of the entire stock between the stockholder, that we will individually pay a monthly assessment of ten dollars ($10) per month for one year, unless sooner rescinded by the Trustees of said mine.

Also, that said monthly assessment shall be paid on or before the tenth day of each month, commencing November 10th, 1872. By order of Trustees,

no2-1m W. A. KOLLMYER, Secretary.

Golden Rule Mining Company—Location of works: Chili Hill, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1872, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at the office of the Company 432 Montgomery street, (Room No. 5) San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the third day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fourth day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. B RUSSELL, Secretary.

Office, Room No. 5, 432 Montgomery street, San Francisco, Cal.

Great Blue Gravel Range Company—Location of works, Blue Gravel Range, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of November, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 18th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 7th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5 and 6, No. 302 Montgomery street, San Francisco, California. no23

Hudson Gold Mining Company—Location of works, Cherokee Mining District, Plumas County, State of California.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 11th day of November, 1872, an assessment of 7½ cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 411 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday, the 16th day of December, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of January, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

JOS. L. KING, Secretary.

Office, 411 California street, San Francisco, California. no16-4t

Indus Gold and Silver Mining Company—Location of works, Virginia City, Storey County Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of October, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Barnard, R	79	10	$5 00
